For further information on the supply of copies of the BNFC to NHS organisations, see <http://tinyurl.com/2uebpp>

The *BNF for Children* is for use by health professionals engaged in prescribing, dispensing, and administering medicines to children. It has been prepared under the guidance of the Paediatric Formulary Committee.

BNF for Children has been constructed using robust procedures for gathering, assessing and assimilating information on paediatric drug treatment. It is, however, expected that the reader will be relying on appropriate professional knowledge and expertise to interpret the contents in the context of the circumstances of the individual child. *BNF for Children* should be used in conjunction with other appropriate and up-to-date literature and, where necessary, supplemented by expert advice. *Special care is required in managing childhood conditions with unlicensed medicines or with licensed medicines for unlicensed uses.*

Responsibility for the appropriate use of medicines lies solely with the individual health professional.

Preface

BNF for Children aims to provide prescribers, pharmacists and other healthcare professionals with sound up-to-date information on the use of medicines for treating children.

A joint publication of the British Medical Association, the Royal Pharmaceutical Society of Great Britain, the Royal College of Paediatrics and Child Health, and the Neonatal and Paediatric Pharmacists Group, *BNF for Children* ('BNFC') is published under the authority of a Paediatric Formulary Committee.

Many areas of paediatric practice have suffered from inadequate information on effective medicines. BNFC addresses this significant knowledge gap by providing practical information on the use of medicines in children of all ages from birth to adolescence. *Medicines for Children* (RCPCH Publications Ltd) and the *British National Formulary* itself form the basis for BNFC. Information in BNFC has been validated against emerging evidence, best-practice guidelines, and crucially, advice from a network of clinical experts.

Drawing information from manufacturers' literature where appropriate, BNFC also includes a great deal of advice that goes beyond marketing authorisations (product licences). This is necessary because licensed indications frequently do not cover the clinical needs of children; in some cases, products for use in children need to be specially manufactured or imported. Careful consideration has been given to establishing the clinical need for unlicensed interventions with respect to the evidence and experience of their safety and efficacy; local paediatric formularies, clinical literature and national information resources have been invaluable in this process.

BNFC has been designed for rapid reference and the information presented has been carefully selected to aid decisions on prescribing, dispensing and administration of medicines. Less detail is given on areas such as malignant disease and the very specialist use of medicines generally undertaken in tertiary centres. BNFC should be interpreted in the light of professional knowledge and it should be supplemented as necessary by specialised publications. Information is also available from medicines information services (see inside front cover).

The website (bnfc.org) includes additional information of relevance to healthcare professionals. BNFC is also available on other digital platforms.

BNFC aims to provide information suited to the needs of the clinician and recognises that, although this edition represents a considerable advance in the content and presentation of information on the paediatric use of medicines, further changes will be necessary. Comments from healthcare professionals are therefore very welcome and should be sent to:

British National Formulary Publications,

Ng, L. P. Omerod, J. Y. Paton, G. A. Pearson, M.M. Ramsay, J. M. Rennie, I. A. G. Roberts, J. Rogers, K. E. Rogstad, P. C. Rubin, J. W. Sander, N. J. Scolding, M. R. Sharland, N. J. Shaw, G. J. Shortland, O. F. W. Stumper, A. G. Sutcliffe, A. Sutherland, C.J. Taylor, E.A. Taylor, M. A. Thomson, J. A. Vale, J. O. Warner, D.A. Warrell, N. J. A. Webb, A.D. Weeks, R. Welbury, W.P. Whitehouse, C. E. Willoughby, C. Wren, A. Wright, M. M. Yaqoob and S. M. Zuberi.

M.J. Kendall, senior medical adviser for BNF Publications has also provided valuable assistance.

Members of the British Association of Dermatologists Therapy Guidelines Subcommittee, H.K. Bell, L. C. Fuller, J. Hughes, S. Lawton, J. Lear, N.J. Levell, A.J. McDonagh, M.J. Tidman, P.D. Yesudian, and M. F. M. Mustapa (Secretariat) have provided valuable advice.

Members of the Advisory Committee on Malaria Prevention, B. A. Bannister, R. H. Behrens, P. L. Chiodini, F. Genasi, L. Goodyer, D. Hill, R. Jecock, G. Kassianos, D. G. Laloo, G. Lea, G. Pasvol, M. Powell, D. V. Shingadia, D. A. Warrell, C. J. M. Whitty, and C. Lucas (Secretariat) have also provided valuable advice.

R. Suvama and colleagues at the MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the *BNF for Children*. NHS Prescription Services have supplied the prices of products in the *BNF for Children*.

Numerous doctors, pharmacists, nurses and others have sent comments and suggestions.

The *BNF for Children* has valuable access to the *Martindale* data banks by courtesy of S. Sweetman and staff.

J. E. Macintyre and staff provided valuable technical assistance

C. Adetola, N. Bansal, A. Breewood, L.M. Britton, I.M. Chiwele, M. Davis, C. Fischetti, S. Foad, E.H. Glover, D.T.H. Griffiths, T. Hamp, J. Humphreys, J.M. James, L.K. Kearney, E. Laughton, A. McLaughlin, A. Melen, H.M.N. Neill, A. Ohene-Djan, O. Ojeleye, A. Parkin, R. Sooriakumaran, R. G. Taljaard, and E.J. Tong provided considerable assistance during the production of this edition of *BNF for Children*.

Xpage have provided technical assistance with the editorial database and typesetting software.

How *BNF for Children* is constructed

BNF for Children (BNFC) is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information, enabling healthcare professionals to select safe and effective medicines for individual children.

Information in BNFC has been validated against emerging evidence, best-practice guidelines, and advice from a network of clinical experts. BNFC includes a great deal of advice that goes beyond marketing authorisations (product licences or summaries of product characteristics). This is necessary because licensed indications frequently do not cover the clinical needs of children; in some cases, products for use in children need to be specially manufactured or imported. Careful consideration has been given to establishing the clinical need for unlicensed interventions with respect to the evidence and experience of their safety and efficacy.

Hundreds of changes are made between editions, and the most clinically significant changes are listed at the front of each edition (p. xiv).

Paediatric Formulary Committee

The Paediatric Formulary Committee (PFC) is responsible for the content of BNFC. The PFC includes a neonatologist and paediatricians appointed by the Royal College of Paediatrics and Child Health, paediatric pharmacists appointed by the Royal Pharmaceutical Society of Great Britain and the Neonatal and Paediatric Pharmacists Group, doctors appointed by the BMJ Publishing Group, a GP appointed by the Royal College of General Practitioners, and representatives from the Medicines and Healthcare products Regulatory Agency (MHRA) and the UK health departments. The PFC decides on matters of policy and reviews amendments to BNFC in the light of new evidence and expert advice. The Committee meets every 6 months and each member also receives proofs of all BNFC chapters for review before publication.

Dental Advisory Group

The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association.

Editorial team

BNFC staff editors are pharmacists with a sound understanding of how drugs are used in clinical practice, including paediatrics. Each staff editor is responsible for editing, maintaining, and updating specific chapters of BNFC. During the publication cycle the staff editors review information in BNFC against a variety of sources (see below).

Amendments to the text are drafted when the editors are satisfied that any new information is reliable and relevant. The draft amendments are passed to expert advisers for comment and then presented to the Paediatric Formulary Committee for consideration. Additionally, for each edition, sections are chosen from every chapter for thorough review. These planned reviews aim to verify all the information in the selected sections and to draft any amendments to reflect current best practice.

Staff editors prepare the text for publication and undertake a number of checks on the knowledge at various stages of the production.

Expert advisers

BNFC uses about 80 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with the production of each edition. The role of these expert advisers is to review existing text and to comment on amendments drafted by the staff editors. These clinical experts help to ensure that BNFC remains reliable by:

- commenting on the relevance of the text in the context of best clinical practice in the UK;

- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- advising on areas where BNFC diverges from summaries of product characteristics;
- advising on the use of unlicensed medicines or of licensed medicines for unlicensed uses ('off-label' use);
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, neonatal care, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, BNFC calls on other clinical specialists for specific developments when particular expertise is required.

BNFC also works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are routinely received for comment and for assimilation into BNFC.

Sources of BNFC information

BNFC uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics BNFC receives summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are a key source of product information and are carefully processed, despite the ever-increasing volume of information being issued by the pharmaceutical industry. Such processing involves:

- verifying the approved names of all relevant ingredients including 'non-active' ingredients (BNFC is committed to using approved names and descriptions as laid down by the Medicines Act);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into BNFC using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by two staff editors before submitting to a senior editor; changes relating to doses receive an extra check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- careful validation of any areas of divergence of BNFC from the SPC before discussion by the Committee (in the light of supporting evidence);
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Expert advisers The role of expert clinical advisers in providing the appropriate clinical context for all BNFC information is discussed above.

Literature Staff editors monitor core medical, paediatric, and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in BNFC and the paper is noted, the new information is assessed for reliability and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Paediatric Formulary Committee. BNFC enjoys a close working relationship with a number of national information providers.

Systematic reviews BNFC has access to various databases of systematic reviews (including the Cochrane Library and various web-based resources). These are used for answering specific queries, for reviewing existing text and

for constructing new text. Staff editors receive training in critical appraisal, literature evaluation, and search strategies. Reviews published in Clinical Evidence are used to validate BNFC advice.

Consensus guidelines The advice in BNFC is checked against consensus guidelines produced by expert bodies. A number of bodies make drafts or pre-publication copies of the guidelines available to BNFC; it is therefore possible to ensure that a consistent message is disseminated. BNFC routinely processes guidelines from the National Institute for Health and Clinical Excellence (NICE), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources Paediatric formularies and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNFC team works closely with the editorial team that produces *Martindale: The Complete Drug Reference*. BNFC has access to *Martindale* information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

Statutory information BNFC routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescription only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that BNFC complies with the relevant sections of the Medicines Act.

BNFC maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug use issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society of Great Britain are included in BNFC as are guidelines from bodies such as the Royal College of Paediatrics and Child Health.

BNFC reflects information from the Drug Tariff, the Scottish Drug Tariff, and the Northern Ireland Drug Tariff.

Pricing information NHS Prescription Services provide information on prices of medicinal products and appliances in BNFC. BNFC also receives and processes price lists from product suppliers.

Comments from readers Readers of BNFC are invited to send in comments. Numerous letters and emails are received during the preparation of each edition. Such feedback helps to ensure that BNFC provides practical and clinically relevant information. Many changes in the presentation and scope of BNFC have resulted from comments sent in by users.

Comments from industry Each manufacturer is provided with a complimentary copy of BNFC and invited to comment on it. Close scrutiny of BNFC by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNFC's presentation of the role of various drugs; this is yet another check on the balance of BNFC advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Virtual user groups BNFC has set up virtual user groups across various healthcare professions (e.g. doctors, pharmacists, nurses). The aim of these groups will be to provide feedback to the editors and publishers to ensure that BNFC publications continue to serve the needs of its users.

Market research Market research is conducted at regular intervals to gather feedback on specific areas of development, such as drug interactions or changes to the way information is presented in digital formats.

BNFC is an independent professional publication that is kept up-to-date and addresses the day-to-day prescribing information needs of healthcare professionals treating children. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately in children.

How to use *BNF for Children*

The *BNF for Children* provides information on the use of medicines in children ranging from neonates (including preterm neonates) to adolescents. The terms infant, child, and adolescent are not used consistently in the literature; to avoid ambiguity actual ages are used in the dose statements in *BNF for Children*. The term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent in *BNF for Children*.

BNF for Children is divided into the following broad areas.

General Guidance

The section on general guidance includes general advice on the use of medicines for managing childhood conditions. It also includes information on prescribing controlled drugs and the management of palliative care. Advice is given on the reporting of adverse reactions. General principles on the use of medicines in hepatic impairment, renal impairment, pregnancy, and breast-feeding are also included in this section.

Notes on conditions, drugs and preparations

The main text consists of classified notes on clinical conditions, drugs and preparations. These notes are divided into 15 chapters, each of which is related

DRUG NAME

Cautions details of precautions required and also any monitoring required

Hepatic impairment advice for use of drug in these circumstances

Renal impairment

Pregnancy

Breast-feeding

Counselling Verbal explanation to the patient of specific details of the drug treatment (e.g. posture when taking a medicine)

Contra-indications details of any contra-indications to use of drug

Side-effects details of common and more serious side-effects

Licensed use licensing status where this is of clinical relevance

Indication and dose

Details of uses and indications

• By route

Child dose and frequency of administration (max. dose) for specific age group

• By alternative route

Child dose and frequency

Approved Name (Non-proprietary) ^(Pm)

Pharmaceutical form colour, coating, active ingredient and amount in dosage form, net price, pack size = basic NHS price. Label: (as in Appendix 3)

1. Exceptions to the prescribing status are indicated by a note or footnote.

Proprietary Name (Manufacturer) ^(Pm) ^(S)

Pharmaceutical form sugar-free, active ingredient mg/mL, net price, pack size = basic NHS price. Label: (as in Appendix 3)

Excipients include clinically important excipients or electrolytes

Note Specific notes about the product e.g. handling

Preparations

Preparations usually follow immediately after the drug which is their main ingredient.

Preparations are included under a non-proprietary title, if they are marketed under such a title, if they are not otherwise prescribable under the NHS, or if they may be prepared extemporaneously.

If proprietary preparations are of a distinctive colour this is stated.

In the case of compound preparations the indications, cautions, contra-indications, side-effects, and interactions of all constituents should be taken into account for prescribing.

When no suitable licensed preparation is available details of preparations that may be imported or formulations available as manufactured specials or extemporaneous preparations are included.

Drugs

The symbol  is used to denote those preparations considered to be less suitable for prescribing. Although such preparations may not be considered as drugs of first choice, their use may be justifiable in certain circumstances.

Prescription-only medicines ^(Pm)

This symbol ^(Pm) has been placed against preparations that are available only on a prescription from an appropriate practitioner.

The symbol  indicates that the preparation is subject to the prescription requirements of the Misuse of Drugs Act. For advice on prescribing such preparations see Prescribing Controlled Drugs.

Preparations not available for NHS prescription ^(S)

This symbol ^(S) has been placed against preparations that are not prescribable under the NHS. Those prescribable only for specific disorders have a footnote specifying the condition(s) for which the preparation remains available. Some preparations which are not prescribable by brand name under the NHS may nevertheless be dispensed using the brand name provided that the prescription shows an appropriate non-proprietary name.

Prices

Prices have been calculated from the basic cost used in pricing NHS prescriptions. The price for an extemporaneously prepared preparation has been omitted where the net cost of the ingredients used to make it would give a misleadingly low impression of the final price. Since the prices shown in the *BNF for Children* do not include professional fees and overhead allowances, they are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchase.

to a particular system of the body or to an aspect of neonatal and paediatric medical care. Each chapter is then divided into sections which begin with *notes* on the selection and use of medicines. Guidance on dental and oral conditions is identified by means of a relevant heading (e.g. Dental and Orofacial pain) in the appropriate sections. The notes are followed by details of relevant drugs and preparations.

Drug entries

Drugs appear under pharmacopoeial or other non-proprietary titles. When there is an *appropriate current monograph* (Medicines Act 1968, Section 65) preference is given to a name at the head of that monograph; otherwise a British Approved Name (BAN), if available, is used. Information on the properties of each drug is organised as shown in the illustration below; the information on cautions, contraindications, side-effects, dose and indications reflects, as far as possible, the manufacturer's summary of product characteristics.

Side-effects are generally listed in order of frequency and arranged broadly by body systems. Occasionally a rare side-effect might be listed first if it is considered to be particularly important because of its seriousness.

For the majority of drugs, *doses* are expressed in terms of body-weight (i.e. standardised by weight). To calculate the dose for a given child the weight-standardised dose is multiplied by the child's weight (or occasionally by the child's ideal body-weight). The calculated dose should not normally exceed the maximum recommended dose for an adult. For example if the dose is 8 mg/kg (max. 300 mg) a child of 10 kg body-weight should receive 80 mg but a child of 40 kg body-weight should receive 300 mg (rather than 320 mg).

Doses are expressed for specific age ranges; neonatal doses are preceded by the word Neonate, all other doses are preceded by the word Child. Age ranges in the BNF for Children are described as follows:

Child 1 month–4 years refers to a child from 1 month old up to their 4th birthday;

Child 4–10 years refers to a child from the day of their 4th birthday up to their 10th birthday.

However, a pragmatic approach should be applied to these cut-off points depending on the child's physiological development, condition, and if weight is appropriate for the child's age.

Emergency treatment of poisoning

This chapter provides information on the management of acute poisoning when first seen, although aspects of hospital-based treatment are mentioned.

Appendixes and indexes

The appendixes include information on interactions, borderline substances, and cautionary and advisory labels for dispensed medicines. They are designed for use in association with the main body of the text.

The Dental Practitioners' List and the Nurse Prescribers' List are also included in this section. The indexes consist of the Index of Manufacturers and the Main Index.

Patient Packs

Directive 92/27/EEC specifies the requirements for the labelling of medicines and outlines the format and content of patient information leaflets to be supplied with every medicine; the directive also requires the use of Recommended International Non-proprietary Names for drugs (see p. xvii).

All medicines have approved labelling and patient information leaflets; anyone who supplies a medicine is responsible for providing the relevant information to the patient (see also Appendix 3).

Many medicines are available in manufacturers' original packs complete with patient information leaflets. Where patient packs are available, the *BNF for Children* shows the number of dose units in the packs. In particular clinical circumstances, where patient packs need to be split or medicines are provided

in bulk dispensing packs, manufacturers will provide additional supplies of patient information leaflets on request.

During the revision of each edition of this publication careful note is taken of the information that appears on the patient information leaflets. Where it is considered appropriate to alert a prescriber to some specific limitation appearing on the patient information leaflet (for example, in relation to pregnancy) this advice now appears in the *BNF for Children*, see also General guidance, patient information leaflets.

The patient information leaflet also includes details of all inactive ingredients in the medicine. A list of common E numbers and the inactive ingredients to which they correspond is now therefore included in the *BNF for Children* (see inside back cover).

PACT and SPA

PACT (Prescribing Analyses and Cost) and SPA (Scottish Prescribing Analysis) provide prescribers with information about their prescribing.

The *PACT Standard Report*, or in Scotland *SPA Level 1 Report*, is sent to all general practitioners on a quarterly basis. The PACT Standard Report contains an analysis of the practitioner's prescribing and the practice prescribing over the last 3 months, and gives comparisons with the local Primary Care Trust equivalent practice and with a national equivalent. The report also contains details of the practice prescribing for a specific topic; a different topic is chosen each quarter.

The *PACT Catalogue*, or in Scotland *SPA Level 2 Report*, provides a full inventory of the prescriptions issued by a prescriber. The PACT catalogue is available on request for periods between 1 and 24 months. To allow the prescriber to target specific areas of prescribing, a Catalogue may be requested to cover individual preparations, BNF sections, or combinations of BNF chapters.

PACT is also available electronically (www.nhsbsa.nhs.uk). This system gives users on-line access through NHSnet to the 3 years' prescribing data held on the NHS Prescription Services' database; tools for analysing the data are also provided.

Prices in the *BNF for Children*

Basic **net prices** are given in the *BNF for Children* to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient or a reduction of the length of an illness or the time spent in hospital.

Prices have generally been calculated from the net cost used in pricing NHS prescriptions dispensed in November 2008; unless an original pack is available these prices are based on the largest pack size of the preparation in use in community pharmacies. The price for an extemporaneously prepared preparation has been omitted where the net cost of the ingredients used to make it would give a misleadingly low impression of the final price.

The unit of 20 is still sometimes used as a basis for comparison, but where suitable original packs or patient packs are available these are priced instead.

Gross prices vary as follows:

1. Costs to the NHS are greater than the net prices quoted and include professional fees and overhead allowances;
2. Private prescription charges are calculated on a separate basis;
3. Over-the-counter sales are at retail price, as opposed to basic net price, and include VAT.

BNF for Children prices are not, therefore, suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff.

It should be noted that separate Drug Tariffs are applicable to England and Wales, Scotland, and Northern Ireland. Prices in the different tariffs may vary.

Changes for this edition

Significant changes

The *BNF for Children* is revised yearly and numerous changes are made between issues. All copies of *BNF for Children 2008* should therefore be withdrawn and replaced by *BNF for Children 2009*. Significant changes have been made in the following sections for *BNF for Children 2009*:

- Adjustment of drug dosages in renal impairment [updated advice and terminology], Prescribing in renal impairment
- Salicylate poisoning, Emergency treatment of poisoning
- Paracetamol poisoning, Emergency treatment of poisoning
- Cyanide poisoning, Emergency treatment of poisoning
- Ethylene glycol and methanol poisoning, Emergency treatment of poisoning
- Heavy metal poisoning, Emergency treatment of poisoning
- Algininate raft-forming oral suspensions, section 1.1.2
- Infliximab for subacute manifestations of ulcerative colitis [NICE guidance], section 1.5
- Fistulating Crohn's disease, section 1.5
- Irritable Bowel Syndrome, section 1.5
- Aminosaliclates [monitoring of renal function], section 1.5.1
- Management of acute asthma, section 3.1
- Beclomethasone dipropionate CFC-free metered dose inhalers [MHRA/CHM advice], section 3.2
- Oxygen, section 3.6
- Over-the-counter cough and cold medicines [MHRA/CHM advice], section 3.9.1
- Melatonin, section 4.1.1
- Attention deficit hyperactivity disorder [updated advice], section 4.4
- Fentanyl [risk of severe respiratory depression with transdermal patch], section 4.7.2
- Pethidine [restricted indications], section 4.7.2
- Clostridium difficile* infection, section 5.1, Table 1
- Hospital-acquired pneumonia, section 5.1, Table 1
- Throat infections, sinusitis, and otitis media, section 5.1, Table 1
- Tendon damage with quinolones [updated advice], section 5.1.12
- Oseltamivir, zanamivir, and amantadine for the prophylaxis and treatment of influenza [updated NICE guidance], section 5.3.4
- Oseltamivir [prophylaxis and treatment of influenza in child under 1 year of age], section 5.3.4
- Ascariacides (common round worm infections) [updated advice], section 5.5.2
- Continuous subcutaneous insulin infusion [NICE guidance], section 6.1.1
- Use of oral hypoglycaemic drugs for type 2 diabetes during pregnancy and breast-feeding, section 6.1.2
- Use of metformin in renal impairment and risk of lactic acidosis, section 6.1.2.2
- Diabetic ketoacidosis [updated advice], section 6.1.3
- Treatment of hypoglycaemia [updated advice on glucose-containing liquids], section 6.1.4
- Combined hormonal contraceptives and risk factors for venous thromboembolism [addition of smoking], section 7.3.1
- Nocturnal enuresis [updated advice], section 7.4.2
- Administration of vinca alkaloids [NPSA advice], section 8.1.4
- Tacrolimus [MHRA/CHM advice], section 8.2.2
- Management of hyperkalaemia, section 9.2.1.1
- Drugs unsafe for use in acute porphyria, section 9.8.2
- Over-the-counter cough and cold medicines [MHRA/CHM advice], section 12.2.2
- Topical oral pain relief products containing salicylates [CHM advice], section 12.3.1
- Topical corticosteroids [counselling, application, and labelling requirements], section 13.4
- Sunscreen preparations [updated advice on Sun Protection Factor], section 13.8.1
- Active immunity [reorganised and updated], section 14.1
- Immunisation schedule [table], section 14.1
- Vaccines and antisera [reformatted and updated], section 14.4
- Risk of neurological and haematological toxic effects with nitrous oxide, section 15.1.2
- Enteral feeds and nutritional supplements [new tables], Borderline Substances, Appendix 2
- Intravenous infusions for neonatal intensive care, Appendix 4

Dose changes

Changes in dose statements introduced into *BNF for Children 2009*:

- Aciclovir [chickenpox and herpes zoster infection], p. 386
- Alpha tocopheryl acetate [malabsorption in cystic fibrosis], p. 582
- Alprostadil, p. 166
- Atomoxetine, p. 234
- Atracurium, p. 780
- Atropine sulphate [control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block], p. 770
- Betaine, p. 594
- Binocrit*[®], p. 537
- Caffeine, p. 202
- Carglumic acid, p. 592
- Caspofungin, p. 365
- Chlorphenamine [by intramuscular or intravenous injection], p. 194
- Chloroquine [treatment of benign malaria], p. 396 and [prophylaxis of malaria], p. 402
- Ciprofloxacin, p. 358
- Concerta*[®] XL, p. 236
- Dantrolene, p. 786
- Diamorphine [intranasal], p. 252
- Diazepam [status epilepticus], p. 284
- Digoxin [maintenance doses for 10–18 years], p. 97
- Dobutamine, p. 143
- Doxycycline [late latent syphilis], p. 330
- Epipen*[®], p. 201
- Eprex*[®], p. 538
- Equasym XL*[®], p. 236
- Erythromycin [gastro-intestinal stasis], p. 58
- Etanercept, p. 612
- European viper venom anti-serum [text], p. 47
- Folic acid [megaloblastic anaemia], p. 535
- Fentanyl [use in anaesthesia], p. 777
- Fluconazole [vaginal candidiasis and candidal balanitis], p. 366
- Gabapentin [epilepsy], p. 270
- Ganciclovir [congenital cytomegalovirus infection of the CNS], p. 388
- Glycopyrronium [control of upper airways secretion and hypersalivation], p. 770
- Halothane, p. 767
- Hydrocortisone [acute hypersensitivity reactions], p. 451
- Hydroxycarbamide, p. 539
- Hydroxyzine hydrochloride, p. 195
- Ipratropium bromide [by inhalation of nebulised solution], p. 169
- Lenograstim [mobilisation of peripheral blood progenitor cells following adjunctive myelosuppressive chemotherapy (to improve yield)], p. 545
- Levetiracetam, p. 273
- Levothyroxine, p. 438
- Lisinopril, p. 133
- Medikinet XL*[®], p. 236
- Methotrexate [severe Crohn's disease], p. 75
- Methylphenidate, p. 235
- Midazolam [intravenous injection for sedation], p. 774
- Midazolam [status epilepticus], p. 286
- Naloxone, p. 40
- Normacol Plus*[®], p. 79
- Pancuronium, p. 781
- Pentasa*[®] granules, p. 70
- Pholcodine, p. 209
- Pralidoxime chloride, p. 47
- Propofol [induction of anaesthesia], p. 765
- Pseudoephedrine, p. 210
- Pulmicort*[®] aerosol inhalation, p. 187
- Pyridostigmine, p. 615
- Rufinamide, p. 276
- Salbutamol [by continuous intravenous infusion], p. 174
- Salbutamol [by inhalation of aerosol or nebulised solution], p. 169
- Salofalk*[®] granules, p. 70
- Sevoflurane [induction of anaesthesia], p. 768
- Sodium bicarbonate, p. 550
- Streptomycin, p. 355
- Sucralfate, p. 62
- Thiamine [metabolic disorders], p. 576
- Timentin*[®], p. 318
- Uniphyllin Continus*[®], p. 180
- Varivax*[®], p. 753
- Varivax*[®], p. 754
- Vecuronium, p. 782
- Vitamin D, p. 578
- Warfarin, p. 153
- Zanamivir [prevention of influenza], p. 392

Classification changes

Classification changes have been made in the following sections of *BNF for Children 2009*:

- Section 1.5.1** Aminosaliclylates [new sub-section]
- Section 1.5.2** Corticosteroids [new sub-section]
- Section 1.5.3** Drugs affecting the immune response [new sub-section]
- Section 1.5.4** Food allergy [new sub-section]
- Section 5.1.2** Cephalosporins, carbapenems, and other beta-lactams [title change]
- Section 5.1.2.1** Cephalosporins [new sub-section]
- Section 5.1.2.2** Carbapenems [new sub-section]
- Section 5.1.2.3** Other beta-lactam antibiotics [new sub-section]
- Section 6.1.2.3** Other antidiabetic drugs [title change]
- Section 6.1.6** Oral glucose tolerance test [sub-section title change]
- Section 11.8.2** Ocular diagnostic and perioperative preparations [title change]

Deleted preparations

Preparations listed below have been discontinued during the compilation of *BNF for Children 2009*, or are still available but are not considered suitable for inclusion by the Paediatric Formulary Committee (see footnote):

<i>AeroBec</i> [®] preparations	<i>Graneodin</i> [®]	<i>Pulmicort LS</i> [®]
<i>Agenerase</i> [®]	<i>Halycitrol</i> [®]	<i>Rapolyte</i> [®]
<i>Aquasept</i> [®]	<i>Hydrocortone</i> [®]	<i>Senokot</i> [®] granules
<i>Ascalix</i> [®]	<i>Icthaband</i> [®]	<i>Ster-Zac Bath Concentrate</i> [®]
Benzatropine	<i>Idrolax</i> [®]	<i>Tri-Adcortyl</i> [®] preparations
<i>Cardilate MR</i> [®]	<i>Intal</i> [®] <i>Spincaps</i>	Tropisetron
<i>Carylderm</i> [®]	<i>Kloref</i> [®]	<i>Vaseline Dermacare</i> [®]
Cimetidine ¹	Liquid paraffin ¹	<i>Vepesid</i> [®] infusion
<i>Claforan</i> [®]	<i>Locoid C</i> [®]	<i>Vibramycin</i> [®] capsules
Daclizumab	<i>Navoban</i> [®]	<i>Vioform-Hydrocortisone</i> [®]
<i>Daonil</i> [®]	<i>Neo-Cortef</i> [®]	<i>Viracept</i> [®] powder
<i>Efcortelan</i> [®]	<i>Nifopress</i> [®] <i>Retard</i>	<i>Viriferon</i> [®]
<i>Euglucon</i> [®]	<i>Nystan</i> [®] cream and ointment	<i>Volmax</i> [®]
<i>Flagyl</i> [®] intravenous infusion	Paraldehyde injection	<i>Zenapax</i> [®]
<i>Fletchers</i> [®] <i>Enemas</i>	Phentolamine mesilate ¹	

New preparations included in this edition

Preparations included in the relevant sections of *BNF for Children 2009*:

<i>Advagraf</i> [®] , p. 524	<i>Grazax</i> [®] , p. 197	<i>Oxyal</i> [®] , p. 639
<i>Apidra</i> [®] , p. 424	<i>Humira</i> [®] , p. 612	<i>Prezista</i> [®] , p. 379
<i>Aptivus</i> [®] , p. 382	<i>Intal</i> [®] CFC-free inhaler, p. 190	<i>Ratiograstim</i> [®] , p. 545
<i>Atripila</i> [®] , p. 378	<i>Intelence</i> [®] , p. 383	<i>Rebetol</i> [®] , p. 394
<i>Avamys</i> [®] , p. 650	<i>Isentress</i> [®] , p. 385	<i>Retacrit</i> [®] , p. 538
Bumetanide oral liquid, p. 104	<i>Isoplex</i> [®] , p. 557	<i>Rosiced</i> [®] , p. 710
<i>Bridion</i> [®] , p. 784	<i>Kuvan</i> [®] , p. 562	<i>Sandocal</i> [®] +D 600, p. 582
<i>Cardioxane</i> [®] , p. 499	<i>Laxido</i> [®] , p. 83	<i>Siklos</i> [®] , p. 539
<i>Celsenti</i> [®] , p. 384	<i>LMX 4</i> [®] , p. 789	<i>Tetraspan</i> [®] , p. 558
<i>Clasteon</i> [®] , p. 470	<i>Maxitram SR</i> [®] , p. 260	<i>Thymoglobuline</i> [®] , p. 521
<i>Clinitas</i> [®] , p. 639	<i>MucoClear</i> [®] , p. 208	<i>Tramquel SR</i> [®] , p. 260
<i>Diacomit</i> [®] , p. 277	<i>Mycamine</i> [®] , p. 370	<i>Vimpat</i> [®] , p. 271
<i>Epilim Chronosphere</i> [®] , p. 280	<i>Myozyme</i> [®] , p. 591	<i>Vismed</i> [®] , p. 639
<i>Ferinject</i> [®] , p. 532	<i>Nicorette</i> [®] <i>Invisi</i> patches, p. 293	<i>Vismed</i> [®] <i>Multi</i> , p. 639
<i>Feriprox</i> [®] , p. 541	<i>NuvaRing</i> [®] , p. 481	<i>Volulyte</i> [®] , p. 558
<i>Flexbumin</i> [®] , p. 557	<i>Ocusan</i> [®] , p. 639	<i>Zavesca</i> [®] , p. 595
<i>Geloplasma</i> [®] , p. 557	<i>Optive</i> [®] , p. 637	

Name changes

European Law requires use of the Recommended International Non-proprietary Name (rINN) for medicinal substances. In most cases the British Approved Name (BAN) and rINN were identical. Where the two differed, the BAN was modified to accord with the rINN.

The following list shows those substances for which the former BAN has been modified to accord with the rINN. Former BANs have been retained as synonyms in *BNF for Children*.

Adrenaline and noradrenaline Adrenaline and noradrenaline are the terms used in the titles of monographs in the European Pharmacopoeia and are thus the official names in the member states. For these substances, BP 2008 shows the European Pharmacopoeia names and the rINNs at the head of the monographs; *BNF for Children* has adopted a similar style.

Former BAN

adrenaline
amethocaine
aminacrine
amoxicillin
amphetamine
amylobarbitone sodium
beclomethasone
bendrofluzide
benzhexol
benzphetamine
busulphan
butobarbitone
articaine
cephalexin
cephradine
chloral betaine
chlorbutol
chlormethiazole
chlorpheniramine
chlorthalidone
cholecalciferol
cholestyramine
clomiphene
colistin sulphomethate sodium
corticotrophin
cyclosporin
cysteamine
dantron
dexamphetamine
dibromopropamide
dicyclomine
dienoestrol
dimethicone(s)
dimethyl sulphoxide
dothiepin
doxycycline hydrochloride (hemihydrate hemiethanolate)
eformoterol
ethamsylate
ethinyloestradiol
ethynodiol

New BAN

see above
tetracaine
aminoacridine
amoxicillin
amfetamine
amobarbital sodium

beclometasone
bendroflumethiazide
trihexyphenidyl
benzfetamine
busulfan
butobarbital
articaine
cefaalexin
cefradine
cloral betaine
chlorobutanol
clomethiazole
chlorphenamine
chlortalidone
colecalfiferol
colestyramine
clomifene
colistimethate sodium

corticotropin
ciclosporin
mercaptamine
dantron
dexamfetamine
dibromopropamide
dicycloverine
dienestrol
dimeticone
dimethyl sulfoxide
dosulepin
doxycycline hyclate

formoterol
etamsylate
ethinyloestradiol
etyndiol

Former BAN

flumethasone
flupenthixol
flurandrenolone
frusemide
guaifenesin
hexachlorophane
hexamine hippurate

hydroxyurea
indomethacin
lignocaine
methotrimeprazine
methyl cysteine
methylene blue

methicillin
mitozantrone
nicoumalone
noradrenaline
oestradiol
oestriol
oestrone
oxpentifylline
phenobarbitone
pipothiazine
polyhexanide
pramoxine
procaine penicillin

prothionamide
quinalbarbitone
riboflavine
salcatonin
sodium calciumedate
sodium cromoglycate
sodium ironedetate
sodium picosulphate
sorbitan monostearate
stibocaptate
stilboestrol
sulphacetamide
sulphadiazine
sulphamethoxazole
sulphapyridine
sulphasalazine
sulphathiazole
sulphinpyrazone
tetracosactrin
thiabendazole
thioguanine
thiopentone
thymoxamine
thyroxine sodium
tribavirin
trimeprazine
urofollitrophin

New BAN

flumetasone
flupentixol
fludrocortide
furosemide
guaifenesin
hexachlorophene
methenamine hippurate
hydroxycarbamide
indometacin
lidocaine
levomepromazine
mecysteine
methylthionium chloride
metcillin
mitoxantrone
acenocoumarol
see above
estradiol
estriol
estrone
pentoxifylline
phenobarbital
pipotiazine
polihexanide
pramocaine
procaine benzylpenicillin
pronamide
secobarbital
riboflavin
calcitonin (salmon)
sodium calcium edetate
sodium cromoglycate
sodium feredetate
sodium picosulfate
sorbitan stearate
sodium stibocaptate
diethylstilbestrol
sulfacetamide
sulfadiazine
sulfamethoxazole
sulfapyridine
sulfasalazine
sulfathiazole
sulfonpyrazone
tetracosactide
tiabendazole
tioguanine
thiopental
moxisylyte
levothyroxine sodium
ribavirin
alimemazine
urofollitropin

General guidance

Medicines should be given to children only when they are necessary, and in all cases the potential benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered (for further details see Prescribing in Pregnancy).

It is important to discuss treatment options carefully with the child and the child's carer (see also Taking Medicines to Best Effect, below). In particular, the child and the child's carer should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, this should be highlighted.

Taking medicines to best effect Difficulties in adherence to drug treatment occur regardless of age. Factors that contribute to poor compliance with prescribed medicines include:

- difficulty in taking the medicine (e.g. inability to swallow the medicine);
- unattractive formulation (e.g. unpleasant taste);
- prescription not collected or not dispensed;
- purpose of medicine not clear;
- perceived lack of efficacy;
- real or perceived side-effects;
- carers' or child's perception of the risk and severity of side-effects may differ from that of the prescriber;
- ambiguous instructions for administration.

The prescriber, the child's carer, and the child (if appropriate) should agree on the health outcomes desired and on the strategy for achieving them ('concordance'). The prescriber should be sensitive to religious, cultural, and personal beliefs of the child's family that can affect acceptance of medicines.

Taking the time to explain to the child (and carers) the rationale and the potential adverse effects of treatment may improve compliance. Reinforcement and elaboration of the physician's instructions by the pharmacist and other members of the healthcare team can be important. Giving advice on the management of adverse effects and the possibility of alternative treatments may encourage carers and children to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce compliance, although there appears to be little difference in compliance between once-daily and twice-daily administration.

Administration of medicines to children Children should be involved in decisions about taking medicines and encouraged to take responsibility for using them correctly. The degree of such involvement will depend on the child's age, understanding, and personal circumstances.

Occasionally a medicine or its taste has to be disguised or masked with small quantities of food. However, unless specifically permitted (e.g. some formulations of pancreatin), a medicine should **not** be mixed with large quantities of food because the full dose might not be taken and the child might develop an aversion to food if the medicine imparts an unpleasant taste. Medicines should **not** be mixed or administered in a baby's feeding bottle.

Children under 5 years (and some older children) find a liquid formulation more acceptable than tablets or capsules. However, for long-term treatment it may be possible for a child to be taught to take tablets or capsules.

An oral syringe (see below) should be used for accurate measurement and controlled administration of an oral liquid medicine. The unpleasant taste of an

oral liquid can be disguised by flavouring it or by giving a favourite food or drink immediately afterwards, but the potential for food-drug interactions should be considered.

Advice should be given on dental hygiene to those receiving medicines containing cariogenic sugars for long-term treatment; sugar-free medicines should be provided whenever possible.

Children with nasal feeding tubes in place for prolonged periods should be encouraged to take medicines by mouth if possible; enteric feeding should generally be interrupted before the medicine is given (particularly if enteral feeds reduce the absorption of a particular drug). Oral liquids can be given through the tube provided that precautions are taken to guard against blockage; the dose should be washed down with warm water. When a medicine is given through a nasogastric tube to a neonate, **sterile water** must be used to accompany the medicine or to wash it down.

The intravenous route is generally chosen when a medicine cannot be given by mouth; reliable access, often a central vein, should be used for children whose treatment involves irritant or inotropic drugs or who need to receive the medicine over a long period or for home therapy. The subcutaneous route is used most commonly for insulin administration. Intramuscular injections should preferably be **avoided** in children, particularly neonates, infants, and young children. However, the intramuscular route may be advantageous for administration of single doses of medicines when intravenous cannulation would be more problematic or painful to the child. Certain drugs, e.g. some vaccines, are only administered intramuscularly.

The intrathecal, epidural and intraosseous routes should be used **only** by staff specially trained to administer medicines by these routes. Local protocols for the management of intrathecal injections must be in place (section 8.1).

Managing medicines in school Administration of a medicine during schooltime should be avoided if possible; medicines should be prescribed for once or twice-daily administration whenever practicable. If the medicine needs to be taken in school, this should be discussed with parents or carers and the necessary arrangements made in advance; where appropriate, involvement of a school nurse should be sought. *Managing Medicines in Schools and Early Years Settings* produced by the Department of Health provides guidance on using medicines in schools (www.dh.gov.uk).

Patient information leaflets Manufacturers' patient information leaflets that accompany a medicine cover only the licensed use of the medicine (see *BNF for Children* and Marketing Authorisation, below). Therefore, when a medicine is used outside its licence, it may be appropriate to advise the child and the child's parent or carer that some of the information in the leaflet might not apply to the child's treatment. Where necessary, inappropriate advice in the patient information leaflet should be identified and reassurance provided about the correct use in the context of the child's condition.

Biosimilar medicines A biosimilar medicine is a new biological product that is similar to a medicine that has already been authorised to be marketed (the biological reference medicine) in the European Union. The active substance of a biosimilar medicine is similar, but not identical, to the biological reference medicine. Biological products are different from standard chemical products in terms of their complexity and although theoretically there should be no important differences between the biosimilar and biological reference medicine in terms of safety or efficacy, when prescribing biological products, it is good practice to use the brand name. This will ensure that substitution of a biosimilar medicine does not occur when the medicine is dispensed.

Biosimilar medicines have black triangle status (▼) at the time of initial marketing. It is important to report suspected adverse reactions to biosimilar medicines using the Yellow Card Scheme (p. 21). For biosimilar medicines, adverse reaction reports should clearly state the brand name of the suspected medicine.

Complementary and alternative medicine An increasing amount of information on complementary and alternative medicine is becoming available. Where appropriate, the child and the child's carers should be asked about the use of their medicines, including dietary supplements and topical products. The scope of *BNF*

for *Children* is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John's wort—see Appendix 1). Further information on herbal medicines is available at www.mhra.gov.uk.

BNF for Children and marketing authorisation Where appropriate the *doses, indications, cautions, contra-indications, and side-effects* in *BNF for Children* reflect those in the manufacturers' Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). *BNF for Children* does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, *BNF for Children* reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisation. Unlicensed products can be obtained from 'special-order' manufacturers or specialist importing companies, see p. 943.

As far as possible, medicines should be prescribed within the terms of the marketing authorisation. However, many children require medicines not specifically licensed for paediatric use. Although medicines cannot be promoted outside the limits of the licence, the Medicines Act does not prohibit the use of unlicensed medicines.

BNF for Children includes advice involving the use of unlicensed medicines or of licensed medicines for unlicensed uses ('off-label' use). Such advice reflects careful consideration of the options available to manage a given condition and the weight of evidence and experience of the unlicensed intervention (see also Unlicensed Medicines, p. 7). Where the advice falls outside a drug's marketing authorisation, *BNF for Children* shows the licensing status in the drug monograph. However, limitations of the marketing authorisation should not preclude unlicensed use where clinically appropriate.

Prescribing unlicensed medicines or medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber's professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines.

Drugs and skilled tasks Prescribers should advise children and their carers if treatment is likely to affect their ability to perform skilled tasks. This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol.

Oral syringes An oral syringe is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5-mL divisions from 1 to 5 mL to measure doses of less than 5 mL. It is provided with an adaptor and an instruction leaflet. The 5-mL spoon is used for doses of 5 mL (or multiples thereof). Different sizes of oral syringe are available for the accurate measurement of smaller volumes, although these can not be prescribed.

Excipients Branded oral liquid preparations that do not contain *fructose, glucose, or sucrose* are described as 'sugar-free' in *BNF for Children*. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked 'sugar-free' since they do not cause dental caries. Children receiving medicines containing cariogenic sugars, or their carers, should be advised of dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible, particularly if treatment is required for a long period.

Where information on the presence of *alcohol, aspartame, gluten, sulphites, tartrazine, arachis (peanut) oil or sesame oil* is available, this is indicated in *BNF for Children* against the relevant preparation.

Information is provided on *selected excipients* in skin preparations (section 13.1.3), in vaccines (section 14.1), and on *selected preservatives and excipients* in eye drops and injections. Pressurised metered aerosols containing *chlorofluorocarbons* (CFCs) have also been identified.

The presence of *benzyl alcohol* and *polyoxyl castor oil* (polyethoxylated castor oil) in injections is indicated in *BNF for Children*. Benzyl alcohol has been associated

with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of *propylene glycol* in oral or parenteral medicines is indicated in *BNF for Children*; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with metronidazole.

In the absence of information on excipients in *BNF for Children* and in the product literature, contact the manufacturer (see Index of Manufacturers) if it is essential to check details.

Health and safety When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Care is required to avoid sources of heat (including hair dryers) when flammable substances are used on the skin or hair. Substances, such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution; contact with the skin and inhalation of dust should be avoided. Healthcare professionals and carers should guard against exposure to sensitising, toxic or irritant substances if it is necessary to crush tablets or open capsules.

Security of prescriptions The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions.

In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Patient group direction (PGD) In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific child. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit the child's care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales).

NICE and Scottish Medicines Consortium Advice issued by the National Institute for Health and Clinical Excellence (NICE) and by the Scottish Medicines Consortium (SMC) is included in *BNF for Children* when relevant. If advice within a NICE Single Technology Appraisal differs from SMC advice, the Scottish Executive expects NHS Boards within NHS Scotland to comply with the SMC advice. Details of the advice together with updates can be obtained from www.nice.org.uk and from www.scottishmedicines.org.

Prescription writing

Shared care

In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Prescriptions¹ should be written legibly in ink or otherwise so as to be indelible², should be dated, should state the full name and address of the patient, and should be signed in ink by the prescriber³. The age and the date of birth of the child should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years.

Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be checked. Consideration should also be given to including the dose per unit mass e.g. mg/kg or the dose per m² body-surface area e.g. mg/m² where this would reduce error.

The following should be noted:

- (a) The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg.
Quantities of 1 gram or more should be written as 1 g, etc.
Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g.
Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg.
When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL.
Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.
- (b) 'Micrograms' and 'nanograms' should **not** be abbreviated. Similarly 'units' should **not** be abbreviated.
- (c) The term 'millilitre' (ml or mL)⁴ is used in medicine and pharmacy, and cubic centimetre, c.c., or cm³ should not be used.
- (d) Dose and dose frequency should be stated; in the case of preparations to be taken 'as required' a **minimum dose interval** should be specified.
Care should be taken to ensure the child receives the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. '125 mg 3 times daily'); terms such as '5 mL' or '1 tablet' should be avoided except for compound preparations.
When doses other than multiples of 5 mL are prescribed for *oral liquid preparations* the dose-volume will be provided by means of an **oral syringe**, see p. 3 (except for preparations intended to be measured with a pipette).
- (e) The names of drugs and preparations should be written clearly and **not** abbreviated, using approved titles **only** (see also advice in box on p. 6 to **avoid** creating generic titles for modified-release preparations).
- (f) The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated.
When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.
- (g) Although directions should preferably be in **English without abbreviation**, it is recognised that some Latin abbreviations are used (for details see Inside Back Cover).

1. These recommendations are applicable for **prescription-only medicines** (POM). For items marked **CD** see also Prescribing Controlled Drugs, p. 17.

2. It is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink.

3. Computer-generated facsimile signatures do not meet the legal requirement.

4. The use of capital 'L' in mL is a printing convention throughout *BNF for Children*; both 'mL' and 'ml' are recognised SI abbreviations.

Abbreviation of titles In general, titles of drugs and preparations should be written *in full*. Unofficial abbreviations should **not** be used as they may be misinterpreted.

Non-proprietary titles Where non-proprietary ('generic') titles are given, they should be used for prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between different manufacturer's versions of the formulation, making it important that the child should always receive the same brand; in such cases, the brand name or the manufacturer should be stated.

Non-proprietary names of **compound preparations** e.g. co-codamol that appear in *BNF for Children* are those that have been introduced by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients.

Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix 'co-' should be retained.

Special care should also be taken to avoid creating generic names for **modified-release** preparations where the use of these names could lead to confusion between formulations with different duration of action.

Strengths and quantities The strength or quantity to be contained in capsules, lozenges, tablets, etc. should be stated by the prescriber. In particular, strengths of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).

Supply of medicines

When supplying a medicine for a child, the pharmacist should ensure that the child and the child's carer understand the nature and identity of the medicine and how it should be used. The child and the carer should be provided with appropriate information (e.g. how long the medicine should be taken for and what to do if a dose is missed or the child vomits soon after the dose is given).

Safety in the home Carers and relatives of children must be warned to keep all medicines out of the reach and sight of children. Tablets, capsules and oral and external liquid preparations must be dispensed in a reclosable *child-resistant container* unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the child's carer will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of *unwanted medicines* by returning them to a pharmacy for destruction.

Validity of prescriptions Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Strength and quantities If a pharmacist receives an incomplete prescription for a systemically administered preparation¹ and considers it would not be appropriate for the patient to return to the prescriber, the following procedures will apply:

- (a) an attempt must always be made to contact the prescriber to ascertain the intention;
- (b) if the attempt is successful the pharmacist must, where practicable, subsequently arrange for details of quantity, strength where applicable, and dosage to be inserted by the prescriber on the incomplete form;
- (c) where, although the prescriber has been contacted, it has not proved possible to obtain the written intention regarding an incomplete prescription, the pharmacist may endorse the form 'p.c.' (prescriber contacted) and add details of the quantity and strength where applicable of the preparation supplied, and of the dose indicated. The endorsement should be initialled and dated by the pharmacist;
- (d) where the prescriber cannot be contacted and the pharmacist has sufficient information to make a professional judgement the preparation may be dispensed. If the quantity is missing the pharmacist may supply sufficient to complete up to 5 days' treatment; except that where a combination pack (i.e. a proprietary pack containing more than one medicinal product) or oral contraceptive is prescribed by name only, the smallest pack shall be dispensed. In all cases the prescription must be endorsed 'p.n.c.' (prescriber not contacted), the quantity, the dose, and the strength (where applicable) of the preparation supplied must be indicated, and the endorsement must be initialled and dated;
- (e) if the pharmacist has any doubt about exercising discretion, an incomplete prescription must be referred back to the prescriber.

Unlicensed medicines A drug or formulation that is not covered by a marketing authorisation (see also *BNF for Children* and Marketing Authorisation) may be obtained from a pharmaceutical company, imported by a specialist importer, manufactured by a commercial or hospital licensed manufacturing unit, or prepared extemporaneously (see below) against a prescription.

1. With the exception of temazepam, an incomplete prescription is not acceptable for controlled drugs in schedules 2 and 3 of the Misuse of Drugs Regulations 2001.

The safeguards that apply to products with marketing authorisation should be extended, as far as possible, to the use of unlicensed medicines. The safety, efficacy, and quality (including labelling) of unlicensed medicines should be assured by means of clear policies on their prescribing, purchase, supply, and administration. Extra care is required with unlicensed medicines because less information may be available on the drug and any formulation of the drug.

The following should be agreed with the supplier when ordering an unlicensed or extemporaneously prepared medicine:

- the specification of the formulation;
- documentation confirming the specification and quality of the product supplied (e.g. a certificate of conformity or of analysis);
- for imported preparations product and licensing information should be supplied in English.

Extemporaneous preparations A product should be dispensed extemporaneously only when no product with a marketing authorisation is available. Every effort should be made to ensure that an extemporaneously prepared product is stable and that it delivers the requisite dose reliably; the child should be provided with a consistent formulation regardless of where the medicine is supplied to minimise variations in quality. Where there is doubt about the formulation, advice should be sought from a medicines information centre, the pharmacy at a children's hospital, a hospital production unit, a hospital quality control department, or the manufacturer.

In many cases it is preferable to give a licensed product by an unlicensed route (e.g. an injection solution given by mouth) than to prepare a special formulation. When tablets or capsules are cut, dispersed, or used for preparing liquids immediately before administration, it is important to confirm uniform dispersal of the active ingredient, especially if only a portion of the solid content (e.g. a tablet segment) is used or if only an aliquot of the liquid is to be administered.

In some cases the child's clinical condition may require a dose to be administered in the absence of full information on the method of administration. It is important to ensure that the appropriate supporting information is available at the earliest opportunity.

Preparation of products that produce harmful dust (e.g. cytotoxic drugs, hormones, or potentially sensitising drugs such as neomycin) should be **avoided** or undertaken with appropriate precautions to protect staff and carers (see also Safety in the Home, above).

The BP direction that a preparation must be *freshly prepared* indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be *recently prepared* indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25° C.

The term **water** used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections, section 9.2.2).

Labelling medicines The *name* of the medicine should appear on the label unless the prescriber indicates otherwise; the name shown on the label should be that written on the prescription. The *strength* should also be stated on the label in the case of preparations that are available in different strengths.

Labels should indicate the *total quantity* of the product dispensed in the container to which the label refers. This requirement applies equally to solid, liquid, internal, and external preparations. If a product is dispensed in more than one container, the reference should be to the amount in each container.

Emergency supply of medicines

Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Prescription Only Medicines (Human Use) Order 1997 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

- (a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
 - (i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
 - (ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed by a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber (formerly a district nurse or health visitor prescriber), a nurse independent prescriber, or a pharmacist independent prescriber, for the person requesting it;
 - (iii) as to the dose that it would be appropriate for the person to take;
- (b) that no greater quantity shall be supplied than will provide 5 days' treatment except when the prescription-only medicine is:
 - (i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
 - (ii) an oral contraceptive when a full cycle may be supplied;
 - (iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;
- (c) that an entry shall be made by the pharmacist in the prescription book stating:
 - (i) the date of supply;
 - (ii) the name, quantity, and, where appropriate, the pharmaceutical form and strength;
 - (iii) the name and address of the patient;
 - (iv) the nature of the emergency;
- (d) that the container or package must be labelled to show:
 - (i) the date of supply;
 - (ii) the name, quantity, and, where appropriate, the pharmaceutical form and strength;
 - (iii) the name of the patient;
 - (iv) the name and address of the pharmacy;
 - (v) the words 'Emergency supply';
 - (vi) the words 'Keep out of the reach of children' (or similar warning);
- (e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital or phenobarbital sodium for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, No. 32, London, Pharmaceutical Press, 2008 (and subsequent editions as available).

Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber (formerly a district nurse or health visitor prescriber), a nurse independent prescriber, or a pharmacist independent prescriber, provided:

- (a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;
- (b) that the prescriber has undertaken to furnish a prescription within 72 hours;
- (c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;
- (d) that the medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital or phenobarbital sodium for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, No. 32, London, Pharmaceutical Press, 2008 (and subsequent editions as available);
- (e) that an entry shall be made in the prescription book stating:
 - (i) the date of supply;
 - (ii) the name, quantity, and, where appropriate, the pharmaceutical form and strength;
 - (iii) the name and address of the practitioner requesting the emergency supply;
 - (iv) the name and address of the patient;
 - (v) the date on the prescription;
 - (vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society's Guidelines

1. The pharmacist should consider the medical consequences of *not* supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, No. 32, London Pharmaceutical Press, 2008 (and subsequent editions).

Drug treatment in children

Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care; the risk of toxicity is increased by a reduced rate of drug clearance and differing target organ sensitivity.

Many children's doses in *BNF for Children* are standardised by **weight** (and therefore require multiplying by the body-weight in kilograms to determine the child's dose); occasionally, the doses have been standardised by **body surface area** (in m^2) (see also *How to Use BNF for Children*, p. xi). These methods should be used rather than attempting to calculate a child's dose on the basis of doses used in adults. If a dose is not stated, prescribers should seek advice from a medicines information centre.

For most drugs the adult maximum dose should not be exceeded. For example if the dose is 8 mg/kg (max. 300 mg) a child of 10 kg body-weight should receive 80 mg but a child of 40 kg body-weight should receive 300 mg (rather than 320 mg). For certain drugs, young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such cases, the dose should be calculated from an ideal weight, related to height and age.

Body surface area (BSA) estimates are often preferable to body-weight for calculating paediatric doses since many physiological phenomena correlate better with body surface area.

Body surface area can be estimated from weight; see inside back cover.

Where the dose for children is not stated, prescribers should seek advice from a medicines information centre.

Dose frequency Most drugs can be administered at slightly irregular intervals during the day. Some drugs, e.g. antimicrobials, are best given at regular intervals. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child's bedtime.

Prescribing in hepatic impairment

Children have a large reserve of hepatic metabolic capacity and modification of the choice and dosage of drugs is usually unnecessary even in apparently severe liver disease. However, special consideration is required in the following situations:

- liver failure characterised by severe derangement of liver enzymes and profound jaundice; the use of sedative drugs, opioids, and drugs such as diuretics and amphotericin which produce hypokalaemia may precipitate hepatic encephalopathy;
- impaired coagulation, which can affect response to oral anticoagulants;
- in cholestatic jaundice elimination may be impaired of drugs such as fusidic acid and rifampicin which are excreted in the bile;
- in hypoproteinaemia, the effect of highly protein-bound drugs such as phenytoin, prednisolone, warfarin, and benzodiazepines may be increased;
- use of hepatotoxic drugs is more likely to cause toxicity in children with liver disease; such drugs should be avoided if possible;
- in neonates, particularly preterm neonates, and also in infants metabolic pathways may differ from older children and adults because liver enzyme pathways may be immature.

Where care is needed in hepatic impairment, this is indicated under the relevant drug in *BNF for Children*.

Prescribing in renal impairment

The use of drugs in children with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may produce toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by children with renal impairment;
- some drugs are not effective when renal function is reduced;
- neonates, particularly preterm, may have immature renal function.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

Principles of dose adjustment in renal impairment

The level of renal function below which the dose of a drug must be reduced depends on the proportion of the drug eliminated by renal excretion and its toxicity.

For many drugs with only minor or no dose-related side-effects, very precise modification of the dose regimen is unnecessary and a simple scheme for dose reduction is sufficient

For more toxic drugs with a small safety margin dose regimens based on glomerular filtration rate should be used. When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma-drug concentration.

The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentration. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment, it can take many doses at the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same as the initial dose for a child with normal renal function.

Nephrotoxic drugs should, if possible, be avoided in children with renal disease because the consequences of nephrotoxicity are likely to be more serious when the renal reserve is already reduced.

Glomerular filtration rate is low at birth and increases rapidly during the first 6 months. Thereafter, glomerular filtration rate increases gradually to reach adult levels by 1–2 years of age, when standardised to a typical adult body surface area (1.73 m²). In the first weeks after birth, serum creatinine falls; a single measure of serum creatinine provides only a crude estimate of renal function and observing the change over days is of more use. In the neonate, a sustained rise in serum creatinine or a lack of the expected postnatal decline, is indicative of a reduced glomerular filtration rate.

Dose recommendations are based on the severity of renal impairment. This is expressed in terms of **glomerular filtration rate** (mL/minute/1.73 m²).

The following equations provide a guide to glomerular filtration rate.

Child over 1 year:

Estimated glomerular filtration rate (mL/minute/1.73 m²)= 40¹ × height (cm)/serum creatinine (micromol/litre)

Neonate:

Estimated glomerular filtration rate (mL/minute/1.73 m²)= 30¹ × height (cm)/serum creatinine (micromol/litre)

The serum-creatinine concentration is sometimes used as a measure of renal function but is only a **rough guide** even when corrected for age, weight, and sex.

1. The values used in these formulas may differ according to locality or laboratory.

Important

The information on dose adjustment in *BNF for Children* is expressed in terms of estimated glomerular filtration rate.

Renal function in adults is increasingly being reported as estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m²; however, eGFR is derived from the MDRD (Modification of Diet in Renal Disease) formula which is not validated for use in children. eGFR derived from the MDRD formula should **not** be used to adjust drug doses in children with renal impairment.

In *BNF for Children*, values for measures of renal function are included where possible. However, where such values are not available, the *BNF for Children* reflects the terms used in the published information.

Chronic kidney disease in adults: UK guidelines for identification, management and referral (March 2006) defines renal function as follows:

Degree of impairment	eGFR ¹ mL/minute/1.73 m ²
Normal: Stage 1	More than 90 (with other evidence of kidney damage)
Mild: Stage 2	60–89 (with other evidence of kidney damage)
Moderate ² : Stage 3	30–59
Severe: Stage 4	15–29
Established renal failure: Stage 5	Less than 15

1. Estimated glomerular filtration rate (eGFR) derived from the Modification of Diet in Renal Disease (MDRD) formula for use in patients over 18 years
 2. NICE clinical guideline 73 (September 2008)—Chronic kidney disease: Stage 3A eGFR = 45–59, Stage 3B eGFR = 30–44

Dialysis

For prescribing in children on renal replacement therapy consult specialist literature.

Drug prescribing should be kept to the minimum in all children with severe renal disease.

If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing **any** drug which requires dose modification.

Where care is needed in renal impairment, this is indicated under the relevant drug entry in *BNF for Children*.

Prescribing in pregnancy

Drugs can have harmful effects on the fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a female of *childbearing age* or for men *trying to father* a child.

During the *first trimester* drugs may produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy.

During the *second* and *third trimesters* drugs may affect the growth and functional development of the fetus or have toxic effects on fetal tissues; and drugs given shortly before term or during labour may have adverse effects on labour or on the neonate after delivery.

BNF for Children identifies drugs which:

- may have harmful effects in pregnancy and indicates the trimester of risk;
- are not known to be harmful in pregnancy.

The information is based on human data but information on *animal* studies has been included for some drugs when its omission might be misleading. Maternal drug doses may require adjustment during pregnancy due to changes in maternal physiology but this is beyond the scope of *BNF for Children*.

Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used.

Few drugs have been shown conclusively to be teratogenic in humans but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available where there is a known risk of certain defects.

Absence of a drug from the list does not imply safety. It should be noted that *BNF for Children* provides independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the National Teratology Information Service Telephone:

Tel: (0191) 232 1525

Tel: (0191) 223 1307 (out of hours emergency only)

www.nyrdtc.nhs.uk/Services/teratology/teratology.html

Prescribing in breast-feeding

Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

Most medicines given to a mother cause no harm to breast-fed infants and there are few contra-indications to breast-feeding when maternal medicines are necessary. However, administration of some drugs to nursing mothers can harm the infant. In the first week of life, some such as preterm or jaundiced infants are at a slightly higher risk of toxicity.

Toxicity to the infant can occur if the drug enters the milk in pharmacologically significant quantities. The concentration in milk of some drugs (e.g. fluvastatin) may exceed the concentration in maternal plasma so that therapeutic doses in the mother can cause toxicity to the infant. Some drugs inhibit the infant's sucking reflex (e.g. phenobarbital) while others can affect lactation (e.g. bromocriptine). Drugs in breast milk may, at least theoretically, cause hypersensitivity in the infant even when concentration is too low for a pharmacological effect. *BNF for Children* identifies drugs:

- which should be used with caution or which are contra-indicated in breast-feeding for the reasons given above;
- which, on present evidence, may be given to the mother during breast-feeding, because they appear in milk in amounts which are too small to be harmful to the infant;
- which are not known to be harmful to the infant although they are present in milk in significant amounts.

For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast milk information in *BNF for Children* should be used only as a guide; absence of information does not imply safety.

Prescribing Controlled Drugs

The Misuse of Drugs Act, 1971 prohibits certain activities in relation to 'Controlled Drugs', in particular their manufacture, supply, and possession. The penalties applicable to offences involving the different drugs are graded broadly according to the *harmfulness attributable to a drug when it is misused* and for this purpose the drugs are defined in the following three classes:

Class A includes: alfentanil, cocaine, diamorphine (heroin), dipipanone, lysergide (LSD), methadone, methylenedioxymethamphetamine (MDMA, 'ecstasy'), morphine, opium, pethidine, phencyclidine, remifentanyl, and class B substances when prepared for injection

Class B includes: oral amphetamines, barbiturates, cannabis, cannabis resin, codeine, ethylmorphine, glutethimide, pentazocine, phenmetrazine, and pholcodine

Class C includes: certain drugs related to the amphetamines such as benzphetamine and chlorphentermine, buprenorphine, diethylpropion, mazindol, meprobamate, pemoline, pipradrol, most benzodiazepines, zolpidem, androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin

The Misuse of Drugs Regulations 2001 define the classes of person who are authorised to supply and possess controlled drugs while acting in their professional capacities and lay down the conditions under which these activities may be carried out. In the regulations drugs are divided into five schedules each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

Schedule 1 includes drugs such as cannabis and lysergide which are not used medicinally. Possession and supply are prohibited except in accordance with Home Office authority.

Schedule 2 includes drugs such as diamorphine (heroin), morphine, remifentanyl, pethidine, secobarbital, glutethimide, amphetamine, and cocaine and are subject to the full controlled drug requirements relating to prescriptions, safe custody (except for secobarbital), the need to keep registers, etc. (unless exempted in Schedule 5).

Schedule 3 includes the barbiturates (except secobarbital, now Schedule 2), buprenorphine, diethylpropion, mazindol, meprobamate, midazolam, pentazocine, phentermine, and temazepam. They are subject to the special prescription requirements (except for temazepam) but not to the safe custody requirements (except for buprenorphine and temazepam) nor to the need to keep registers (although there are requirements for the retention of invoices for 2 years).

Schedule 4 includes in Part I benzodiazepines (except temazepam and midazolam which are in Schedule 3) and zolpidem, which are subject to minimal control. Part II includes androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin. Controlled Drug prescription requirements do not apply (but see Department of Health Guidance, p. 18) and Schedule 4 Controlled Drugs are not subject to safe custody requirements.

Schedule 5 includes those preparations which, because of their strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

Prescriptions Preparations in Schedules 2 and 3 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout *BNF for Children* by the symbol  (Controlled Drug). The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance, p. 18).

Prescription requirements

Prescriptions for Controlled Drugs that are subject to prescription requirements¹ must be indelible² and must be *signed* by the prescriber, *be dated*, and specify the prescriber's *address*. The prescription must always state:

- The name and address of the patient;
- In the case of a preparation, the form³ and where appropriate the strength⁴ of the preparation;
- either the total quantity (in both words and figures) of the preparation⁵, or the number (in both words and figures) of dosage units, as appropriate, to be supplied; in any other case, the total quantity (in both words and figures) of the Controlled Drug to be supplied;
- The dose⁶;
- The words 'for dental treatment only' if issued by a dentist.

A pharmacist is **not** allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist⁷. Failure to comply with the regulations concerning the writing of prescriptions will result in inconvenience to patients and carers and delay in supply of the necessary medicine. A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon⁸.

Instalments and 'repeats' A prescription may order a Controlled Drug to be dispensed by instalments; the amount of instalments and the intervals to be observed must be specified.⁹ Prescriptions ordering 'repeats' on the same form are **not** permitted for Controlled Drugs in Schedules 2 or 3.

For a sample prescription, see p. 19

Private prescriptions Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms provided by Primary Care Trusts in England, Health Boards in Scotland, Local Health Boards in Wales or the Northern Ireland Central Services Agency; in addition, prescriptions must specify the *prescriber's identification number*. Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirement for private prescriptions.

Department of Health guidance Guidance (June 2006) issued by the Department of Health in England on prescribing and dispensing of Controlled Drugs requires:

- in general, prescriptions for Controlled Drugs in Schedules 2, 3, and 4 to be limited to a supply of up to 30 days' treatment; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient's notes;
- the patient's identifier to be shown on NHS and private prescriptions for Controlled Drugs in Schedules 2 and 3.

Further information is available at www.dh.gov.uk.

Dependence and misuse The most serious drugs of addiction are **cocaine**, **diamorphine** (heroin), **morphine**, and the **synthetic opioids**.

1. All preparations in Schedules 2 and 3, except temazepam.
2. A machine-written prescription is acceptable. The prescriber's signature must be handwritten.
3. The dosage form (e.g. tablets) must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name (e.g. *MST Continus*) or whether only one form is available.
4. When more than one strength of a preparation exists the strength required must be specified.
5. The Home Office has advised that quantities of liquid preparations such as methadone mixture should be written in millilitres.
6. The instruction 'one as directed' constitutes a dose but 'as directed' does not.
7. Implementation date for *N. Ireland* not confirmed.
8. The prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription.
9. A total of 14 days' treatment by instalment of any drug listed in Schedule 2 of the Misuse of Drugs Regulations, buprenorphine and diazepam may be prescribed in England. In *England*, forms FP10(MDA) (blue) and FP10H(MDA) (blue) should be used. In *Scotland*, forms GP10 (peach), HBP (blue), or HBPA (pink) should be used. In *Wales* a total of 14 days' treatment by instalment of any drug listed in Schedules 2-5 of the Misuse of Drugs Regulations may be prescribed. In *Wales*, form WP10(MDA) or form WP10HP(AD) should be used.

Despite marked reduction in the prescribing of **amphetamines** the abuse of illicit amphetamine and related compounds is widespread.

The benzodiazepine **temazepam** has commonly been associated with misuse. The misuse of **barbiturates** is now less common, in line with declining prescription numbers.

Cannabis (Indian hemp) has no approved medicinal use and cannot be prescribed by doctors. Its use is illegal but has become widespread. Cannabis is a mild hallucinogen seldom accompanied by a desire to increase the dose; withdrawal symptoms are unusual. **Lysergide** (lysergic acid diethylamide, LSD) is a much more potent hallucinogen; its use can lead to severe psychotic states which can be life-threatening.

Prescribing drugs likely to cause dependence or misuse The prescriber has three main responsibilities:

- to avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious;
- to see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. The prescriber should keep a close eye on the amount prescribed to prevent patients or their carers from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a new patient for the first time;
- to avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining medicines which include visiting more than one doctor, fabricating stories, and forging prescriptions.

General guidance

Pharmacy Stamp	Age 68yrs 9mths D.o.B 2/6/1939	Title, Forename, Surname & Address SMITH John 22 Bridge Street Anytown KB1 5SX
<i>Please don't stamp over age box</i>

Endorsements	Diamorphine 30mg ampoules Supply 6(six) ampoules 60mg daily by subcutaneous infusion over 24 hours [No more items on this prescription]	
Signature of prescriber 		Date 02/03/08
For dispenser No. of Prescrip. on form	Anyborough Health Authority Dr D O Good 345543 7 High Street Anytown KB1 CD2 Tel: 0111 222 333	
	FP10NC0105	

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if dependence is suspected.

The stealing and misuse of prescription forms could be minimised by the following precautions:

- (a) do not leave unattended if called away from the consulting room or at reception desks; do not leave in a car where they may be visible; when not in use, keep in a locked drawer within the surgery and at home;
- (b) draw a diagonal line across the blank part of the form under the prescription;
- (c) the quantity should be shown in words and figures when prescribing drugs prone to abuse; this is obligatory for controlled drugs (see Prescriptions, above);
- (d) alterations are best avoided but if any are made they should be clear and unambiguous; add initials against altered items;
- (e) if prescriptions are left for collection they should be left in a safe place in a sealed envelope.

Travelling abroad Prescribed drugs listed in Schedule 4 Part II (CD Anab) and Schedule 5 of the Misuse of Drugs Regulations 2001 are not subject to export or import licensing. However, patients intending to travel abroad for more than 3 months carrying any amount of drugs listed in Schedules 2, 3, or 4 Part I (CD Benz) will require a personal export/import licence. Further details can be obtained at www.drugs.homeoffice.gov.uk/drugs-laws/licensing/personal, or from the Home Office by contacting (020) 7035 0484 or licensing_enquiry.aadu@homeoffice.gsi.gov.uk.

Applications must be supported by a covering letter from the prescriber and should give details of:

- the patient's name and current address;
- the quantities of drugs to be carried;
- the strength and form in which the drugs will be dispensed;
- the country or countries of destination;
- the dates of travel to and from the United Kingdom.

Applications for licences should be sent to the Home Office, Drugs Licensing, Peel Building, 2 Marsham Street, London, SW1P 4DF. Alternatively, completed application forms can be emailed to licensing_enquiry.aadu@homeoffice.gsi.gov.uk with a scanned copy of the covering letter from the prescriber. A minimum of two weeks should be allowed for processing the application.

Patients travelling for less than 3 months do not require a personal export/import licence for carrying Controlled Drugs, but are advised to carry a letter from the prescribing doctor. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who wish to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who wish to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act and facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it would be necessary to approach that country's consulate in the UK.

Notification of drug misusers

Doctors should report cases of drug misuse to their regional or national drug misuse database or centre—for further advice and contact telephone numbers consult the BNF.

Adverse reactions to drugs

Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Doctors, dentists, coroners, pharmacists, and nurses (see also self-reporting, below) are urged to report suspected adverse reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.yellowcard.gov.uk. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in this book (inside back cover).

Medicines and Healthcare products Regulatory Agency
CHM
Freepost
London, SW8 5BR.
Tel: (0800 731 6789)

The reporting of **all** suspected adverse drug reactions in children, including those relating to unlicensed or off-label use of medicines, is **strongly encouraged** through the Yellow Card Scheme even if the intensive monitoring symbol (▼) has been removed, because experience in children may still be limited.

The identification and reporting of adverse reactions to drugs in children is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs may not be extensively tested in children;
- children may be more susceptible to developmental disorders or they may have delayed adverse reactions which do not occur in adults;
- many drugs are not specifically licensed for use in children and are used 'off-label';
- suitable formulations may not be available to allow precise dosing in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Suspected adverse reactions to *any* therapeutic agent should be reported, including drugs (*self-medication* as well as those *prescribed*), blood products, vaccines, radiographic contrast media, complementary and herbal products.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

A 24-hour Freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

The following Yellow Card Centres may *follow up* reports:

Yellow Card Centre, North West
70 Pembroke Place
Liverpool, L69 3GF.
Tel: (0151) 794 8206

Yellow Card Centre, Wales
Freepost
Cardiff, CF4 1ZZ.
Tel: (029) 2074 4181 (direct line)

Yellow Card Centre, Northern & Yorkshire
Wolfson Unit
Claremont Place
Newcastle upon Tyne, NE2 4HH.
Tel: (0191) 260 6181 (direct line)

Yellow Card Centre, West Midlands
 Freepost SW2991
 Birmingham, B18 7BR.
 Tel: (0121) 507 5672

Yellow Card Centre, Scotland
 CARDS, Royal Infirmary of Edinburgh
 Freepost RRAR-RUXE-GJGX
 Edinburgh, EH16 4SA.
 Tel: (0131) 242 2919

The MHRA's database facilitates the monitoring of adverse drug reactions.

More detailed information on reporting and a list of products currently under intensive monitoring can be found on the MHRA website:

www.mhra.gov.uk.

Drug Safety Update is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at www.mhra.gov.uk/mhra/drugsafetyupdate.

Self-reporting Patients, parents, and carers can also report suspected adverse reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.yellowcard.gov.uk or by telephone on 0808 100 3352. Alternatively, patient Yellow Cards are available from pharmacies or can be downloaded from www.mhra.gov.uk, where more detailed information on patient reporting is available.

Adverse reactions to medical devices Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Prescription-event monitoring In addition to the MHRA's Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit's educational material is available from www.dsru.org.

Side-effects in the BNF for Children The *BNF for Children* includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers' literature may be omitted from the *BNF for Children*.

In the product literature the frequency of side-effects is generally described as follows:

<i>Very common</i>	greater than 1 in 10
<i>Common</i>	1 in 100 to 1 in 10
<i>Uncommon</i> ['less commonly' in <i>BNF for Children</i>]	1 in 1000 to 1 in 100
<i>Rare</i>	1 in 10 000 to 1 in 1000
<i>Very rare</i>	less than 1 in 10 000

Special problems

Symptoms Children may be poor at expressing the symptoms of an adverse drug reaction and parental opinion may be required.

Delayed drug effects Some reactions (e.g. cancers, and effects on development) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

Congenital abnormalities When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

Prevention of adverse reactions

Adverse reactions may be prevented as follows:

- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the child has had previous reactions to the drug or formulation;
- prescribe as few drugs as possible and give very clear instructions to the child, parent, or carer;
- whenever possible use a familiar drug; with a new drug be particularly alert for adverse reactions or unexpected events;
- consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
- obtain a full drug history including asking if the child is already taking other drugs *including over-the-counter medicines*; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, particularly in neonates, which can affect the potential for adverse effects. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effects of the drug;
- warn the child, parent, or carer if serious adverse reactions are liable to occur.

Defective medicines

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should **not** be confused with an Adverse Drug Reaction where the product conforms to its specification.

The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

Prescribing in palliative care

Palliative care is the active total care of children and young adults who have incurable, life-limiting conditions and are not expected to survive beyond young adulthood.

The child may be cared for in a hospice or at home according to the needs of the child and the child's family. In all cases, children should receive total care of their physical, emotional, social, and spiritual needs, and their families should be supported throughout. In particular, specialist palliative care is essential for end-of-life care of the child and for supporting the family through death and bereavement.

Drug treatment The number of drugs should be as few as possible. Oral medication is usually appropriate unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

Pain

Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol (p. 247) or a **NSAID** (section 10.1.1) given regularly will often make the use of opioid analgesics unnecessary. A NSAID may also control the pain of *bone secondaries*. Radiotherapy and bisphosphonates (section 6.6.2) may also be useful for pain due to bone metastases.

An opioid analgesic (section 4.7.2) such as **codeine** (p. 252), alone or in combination with a non-opioid analgesic at adequate dosage, may be helpful in the control of moderate pain if non-opioid analgesics alone are not sufficient. If these preparations do not control the pain, **morphine** (p. 255) is the most useful opioid analgesic. Alternatives to morphine, including transdermal **fentanyl** (see below and p. 253), are best initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological or physical dependence (addiction).

Equivalent single doses of opioid analgesics

These equivalences are intended **only** as an approximate guide; patients should be carefully monitored after **any** change in medication and dose titration may be required

Analgesic	Dose
Morphine salts (oral)	10 mg
Diamorphine hydrochloride (subcutaneous)	3 mg
Hydromorphone hydrochloride	1.3 mg
Oxycodone (oral)	5 mg

Oral route Morphine (p. 255) is given *by mouth* as an oral solution or as standard ('immediate release') tablets regularly every 4 hours, the initial dose depending largely on the patient's previous treatment. If the first dose of morphine is no more effective than the previous analgesic, the next dose should be increased by 30–50%, the aim being to choose the lowest dose that prevents pain. The dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics (such as NSAIDs) should also be considered. Although low doses of morphine are usually adequate there should be no hesitation in increasing the dose stepwise according to response if necessary.

If pain occurs between regular doses of morphine ('breakthrough pain'), an additional dose ('rescue dose') should be given. An additional dose should also be given 30 minutes before an activity that causes pain (e.g. wound dressing).

When the pain is controlled and the patient's 24-hour morphine requirement is established, the daily dose can be given as a single dose or in 2 divided doses as a *modified-release preparation*. The first dose of the modified-release preparation is given within 4 hours of the last dose of the oral solution.¹

1. Studies have indicated that administration of the last dose of the *oral solution* with the first dose of the *modified-release tablets* is not necessary.

MST Continus® tablets or suspension (p. 257) are designed for twice daily administration; *MXL*® capsules (p. 257) allow administration of the total daily morphine requirement as a single dose.

Alternatively, a *modified-release preparation* may be commenced immediately and the dose adjusted according to pain control. The starting dose of modified-release preparations designed for twice daily administration is usually 200–800 micrograms/kg every 12 hours if no other analgesic (or only paracetamol) has been taken previously, but to replace a weaker opioid analgesic (such as codeine) the starting dose is usually higher. Increments should be made to the dose, not to the frequency of administration, which should remain at every 12 hours.

Morphine, as oral solution or standard formulation tablets, should be prescribed for breakthrough pain; the dose should be about one-sixth of the total daily dose of oral morphine repeated every 4 hours if necessary (review pain management if analgesic required more frequently). Children often require a higher dose of morphine in proportion to their body-weight compared to adults. Children are more susceptible to certain adverse effects of opioids such as urinary retention (which can be eased by carbachol or bethanechol), and opioid-induced pruritus.

Oxycodone (p. 257) is used in a child who requires an opioid but cannot tolerate morphine. If the child is already receiving an opioid, oxycodone should be started at a dose equivalent to the current analgesic.

Parenteral route **Diamorphine** (p. 252) is preferred for injection because, being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose is approximately a third of the oral dose of morphine. *Subcutaneous infusion* of diamorphine via a continuous infusion device can be useful (for details, see p. 28).

If the child can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of diamorphine. See table of approximate equivalent doses of morphine and diamorphine, p. 29.

Rectal route Morphine (p. 257) is also available for *rectal administration* as suppositories.

Transdermal route Transdermal preparations of fentanyl (p. 254) are available; they are not suitable for acute pain or in those children whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations (see under fentanyl, p. 253) because prescribing errors have caused fatalities.

The following 24-hour doses of morphine **by mouth** are considered to be approximately equivalent to the fentanyl patches shown:

Morphine salt 45 mg daily ≡ fentanyl '12' patch

Morphine salt 90 mg daily ≡ fentanyl '25' patch

Morphine salt 180 mg daily ≡ fentanyl '50' patch

Morphine salt 270 mg daily ≡ fentanyl '75' patch

Morphine salt 360 mg daily ≡ fentanyl '100' patch

Morphine (as oral solution or standard formulation tablets) is given for breakthrough pain.

Gastro-intestinal pain The pain of *bowel colic* may be reduced by loperamide (p. 65). Hyoscine hydrobromide (p. 245) may also be helpful in reducing the frequency of spasms; it is given sublingually at a dose of 10 micrograms/kg (max. 300 micrograms) 3 times daily as *Kwells*® tablets. For the dose by subcutaneous infusion using a continuous infusion device, see p. 28).

Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antiflatulent (p. 51) and a prokinetic such as domperidone (p. 58) before meals.

Muscle spasm The pain of muscle spasm can be helped by a muscle relaxant such as diazepam (p. 618) or baclofen (p. 616).

Neuropathic pain Patients with neuropathic pain (p. 261) may benefit from a trial of a tricyclic antidepressant, most commonly amitriptyline (p. 229), for

several weeks. An anticonvulsant, most commonly carbamazepine (p. 267), may be added or substituted if pain persists; gabapentin is licensed for neuropathic pain in adults.

Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone, which reduces oedema around the tumour, thus reducing compression.

Nerve blocks can be considered when pain is localised to a specific area. **Transcutaneous electrical nerve stimulation (TENS)** may also help.

Miscellaneous conditions

Unlicensed indications or routes

Several recommendations in this section involve unlicensed indications or routes.

Anorexia Anorexia may be helped by prednisolone or dexamethasone.

Anxiety Anxiety can be treated with a long-acting benzodiazepine such as diazepam, or by continuous infusion of the short-acting benzodiazepine midazolam. Interventions for more acute episodes of anxiety (such as panic attacks) include short-acting benzodiazepines such as lorazepam given sublingually or midazolam given subcutaneously. Temazepam provides useful night-time sedation in some children.

Capillary bleeding Capillary bleeding can be treated with tranexamic acid (p. 158) by mouth; treatment is usually continued for one week after the bleeding has stopped but it can be continued at a reduced dose if bleeding persists. Alternatively, gauze soaked in tranexamic acid 100 mg/mL or adrenaline (epinephrine) solution 1 mg/mL (1 in 1000) can be applied to the affected area. Vitamin K may be useful in bleeding associated with liver dysfunction.

Constipation Constipation is a very common cause of distress and is almost invariable after administration of an opioid analgesic. It should be prevented if possible by the regular administration of laxatives. Suitable laxatives include osmotic laxatives (p. 83) (such as lactulose or macrogols), stimulant laxatives (p. 79) (such as co-danthramer and senna) or the combination of lactulose and a senna preparation. Naloxone given by mouth may help relieve opioid-induced constipation; it is poorly absorbed and there is little risk of it reversing opioid analgesia.

Convulsions Intractable seizures are relatively common in children dying from non-malignant conditions. Phenobarbital by mouth or as a continuous subcutaneous infusion may be beneficial; continuous infusion of midazolam is an alternative. Both cause drowsiness, but this is rarely a concern in the context of intractable seizures. For breakthrough convulsions diazepam (p. 284) given rectally (as a solution), buccal midazolam (p. 286), or paraldehyde (p. 286) as an enema may be appropriate.

For the use of midazolam by subcutaneous infusion using a continuous infusion device, see p. 28.

Dry mouth Dry mouth may be caused by certain medications including opioid analgesics, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered. Dry mouth may be relieved by good mouth care and measures such as sucking ice or pineapple chunks, chewing gum, or the use of artificial saliva (p. 661); dry mouth associated with candidiasis can be treated by oral preparations of nystatin (p. 658) or miconazole (p. 658); alternatively, fluconazole (p. 366) can be given by mouth.

Dysphagia A corticosteroid such as dexamethasone may help, temporarily, if there is an obstruction due to tumour. See also Dry Mouth, above.

Dyspnoea Breathlessness at rest may be relieved by regular oral morphine in carefully titrated doses. Diazepam may be helpful for dyspnoea associated with anxiety. Sublingual lorazepam or subcutaneous or buccal midazolam are alternatives. A nebulised short-acting beta₂ agonist (section 3.1.1.1) or a corticosteroid (section 3.2), such as dexamethasone or prednisolone, may also be helpful for bronchospasm or partial obstruction.

Excessive respiratory secretion Excessive respiratory secretion (death rattle) may be reduced by hyoscine hydrobromide patches (p. 245) or by subcutaneous or intravenous injection of hyoscine hydrobromide 10 micrograms/kg (max. 600 micrograms) every 4 to 8 hours; however, care must be taken to avoid the discomfort of dry mouth. Alternatively, glycopyrronium (p. 770) may be given. Benzodiazepines such as rectal diazepam or subcutaneous midazolam may be helpful in the final stages.

Fungating tumours Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole (p. 356) is often required, but topical metronidazole (p. 709) is also used.

Hiccup Hiccup due to gastric distension may be helped by a preparation incorporating an antacid with an antiflatulent (p. 52).

Hypercalcaemia See section 9.5.1.2.

Insomnia Children with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics (p. 212) are used. Benzodiazepines, such as temazepam, may be useful.

Intractable cough Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine every 4 hours. Methadone linctus should be avoided because it has a long duration of action and tends to accumulate.

Mucosal bleeding Mucosal bleeding from the mouth and nose occurs commonly in the terminal phase, particularly in a child suffering from haemopoietic malignancy. Bleeding from the nose caused by a single bleeding point can be arrested by cauterisation or by dressing it. Tranexamic acid (p. 158) may be effective applied topically or given systemically.

Nausea and vomiting Nausea and vomiting are common in children with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic (section 4.6) is started.

Nausea and vomiting with opioid therapy are less common in children than in adults but may occur particularly in the initial stages and can be prevented by giving an antiemetic. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term).

Metoclopramide has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not therefore be used concurrently.

Haloperidol (p. 219) is used by mouth for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure).

Cyclizine (p. 239) is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness.

Ondansetron (p. 244) is most effective when the vomiting is due to damaged or irritated gut mucosa (e.g. after chemotherapy or radiotherapy).

Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

Levomepromazine (methotrimeprazine) (p. 219) can be used if first-line antiemetics are inadequate. Dexamethasone by mouth can be used as an adjunct.

For the administration of antiemetics by subcutaneous infusion using a syringe driver, see below.

For the treatment of nausea and vomiting associated with cancer chemotherapy, see section 8.1.

Pruritus Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients (p. 666). Ondansetron may be effective in some children. Where opioid analgesics cause pruritus

it may be appropriate to review the dose or to switch to an alternative opioid analgesic. In the case of obstructive jaundice, further measures include administration of colestyramine (p. 93).

Raised intracranial pressure Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone, for 4 to 5 days, subsequently reduced if possible; dexamethasone should be given before 6 p.m. to reduce the risk of insomnia. Treatment of headache and of associated nausea and vomiting should also be considered.

Restlessness and confusion Restlessness and confusion may require treatment with haloperidol (p. 219) 10–20 micrograms/kg by mouth every 8–12 hours. Levomepromazine (methotrimeprazine) (p. 219) is also used occasionally for restlessness.

Continuous infusion devices

Although drugs can usually be administered *by mouth* to control symptoms in palliative care, the parenteral route may sometimes be necessary. Repeated administration of *intramuscular injections* should be avoided in children, particularly if cachectic. This has led to the use of portable continuous infusion devices such as syringe drivers to give a *continuous subcutaneous infusion*, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Syringe driver rate settings

Staff using syringe drivers should be **adequately trained** and different rate settings should be **clearly identified** and **differentiated**; incorrect use of syringe drivers is a common cause of medication errors.

Indications for the **parenteral route** are:

- inability to take medicines by mouth owing to *nausea and vomiting, dysphagia, severe weakness, or coma*;
- *malignant bowel obstruction* for which surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube);
- refusal by the child to take regular medication by mouth.

Bowel colic and excessive respiratory secretions Hyoscine hydrobromide (p. 245) effectively reduces respiratory secretions and is sedative (but occasionally causes paradoxical agitation); it is given in a *subcutaneous or intravenous infusion dose* of 40–60 micrograms/kg/24 hours. Glycopyrronium (p. 770) may also be used.

Hyoscine butylbromide (p. 55) is effective in bowel colic, is less sedative than hyoscine hydrobromide, but is not always adequate for the control of respiratory secretions; it is given by *subcutaneous infusion* (**important**: *hyoscine butylbromide* must not be confused with *hyoscine hydrobromide*, above).

Convulsions If a child has previously been receiving an antiepileptic drug *or* has a primary or secondary cerebral tumour *or* is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam (p. 286) is the benzodiazepine antiepileptic of choice for *continuous subcutaneous infusion*.

Nausea and vomiting Levomepromazine (methotrimeprazine) (p. 219) causes sedation in about 50% of patients. Haloperidol (p. 219) has little sedative effect.

Cyclizine (p. 239) is particularly likely to precipitate if mixed with diamorphine or other drugs (see under Mixing and Compatibility); it is given by *subcutaneous infusion*.

Pain control Diamorphine (p. 252) is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under Mixing and Compatibility). The table on p. 29 shows approximate equivalent doses of morphine and diamorphine.

Restlessness and confusion Haloperidol has little sedative effect. Levomepromazine (methotrimeprazine) (p. 219) has a sedative effect. Midazolam is a sedative and an antiepileptic that may be suitable for a very restless patient.

Mixing and compatibility The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe

drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine, prochlorperazine, and diazepam are **contra-indicated** as they cause skin reactions at the injection site; to a lesser extent cyclizine and levomepromazine (methotrimeprazine) also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9%) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are so slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Diamorphine can be given by subcutaneous infusion in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either *water for injections* or *physiological saline* (sodium chloride 0.9%) is a suitable diluent—above that strength only *water for injections* is used (to avoid precipitation).

The following can be mixed with *diamorphine*:

Cyclizine ¹	Hyoscine hydrobromide
Dexamethasone ²	Levomepromazine
Haloperidol ³	Metoclopramide ⁴
Hyoscine butylbromide	Midazolam

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discoloration) and to ensure that the infusion is running at the correct rate.

Equivalent doses of morphine sulphate and diamorphine hydrochloride

These equivalences are *approximate only* and may need to be adjusted according to response

MORPHINE		PARENTERAL DIAMORPHINE
Morphine sulphate by mouth (oral solution or standard tablets)	Morphine sulphate by subcutaneous infusion	Diamorphine hydrochloride by subcutaneous infusion
every 4 hours	every 24 hours	every 24 hours
5 mg	15 mg	10 mg
10 mg	30 mg	20 mg
15 mg	45 mg	30 mg
20 mg	60 mg	40 mg
30 mg	90 mg	60 mg
40 mg	120 mg	80 mg
60 mg	180 mg	120 mg
80 mg	240 mg	160 mg
100 mg	300 mg	200 mg
130 mg	390 mg	260 mg
160 mg	480 mg	320 mg
200 mg	600 mg	400 mg

If breakthrough pain occurs give a subcutaneous injection equivalent to one-sixth of the total 24-hour subcutaneous infusion dose. With an intermittent subcutaneous injection absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle).

To minimise the risk of infection no subcutaneous infusion solution should be used for longer than 24 hours.

1. Cyclizine may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
2. Special care is needed to avoid precipitation of dexamethasone when preparing it.
3. Mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
4. Under some conditions, infusions containing metoclopramide become discoloured; such solutions should be discarded.

Problems encountered with syringe drivers The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs *too quickly* check the rate setting and the calculation;
- if the subcutaneous infusion runs *too slowly* check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an *injection site reaction* make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

Prescribing in dental practice

Advice on the drug management of dental and oral conditions is covered in the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections.

The following is a list of topics of particular relevance to dental surgeons.

General guidance

Prescribing by dental surgeons, see BNF

Oral side-effects of drugs, see BNF

Medical emergencies in dental practice, see BNF

Medical problems in dental practice, see BNF

Drug management of dental and oral conditions

Dental and orofacial pain, p. 246

Neuropathic pain, p. 261

Non-opioid analgesics, p. 246

Drugs and sport

UK Sport advises that athletes are personally responsible should a prohibited substance be detected in their body. Information and advice, including the status of specific drugs in sport, can be obtained from UK Sport's Drug Information Database at www.didglobal.com. Alternatively, an advice card listing examples of permitted and prohibited substances is available from:

Drug-Free Sport
UK Sport
40 Bernard Street
London, WC1N 1ST.
Tel: 0800 528 0004
drug-free@uksport.gov.uk
www.uksport.gov.uk

A similar card detailing classes of drugs and doping methods prohibited in football is available from the Football Association.

General Medical Council's advice

Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual's performance in sport contravene the GMC's guidance, and such actions would usually raise a question of a doctor's continued registration. This does not preclude the provision of any care or treatment where the doctor's intention is to protect or improve the patient's health.

Emergency treatment of poisoning

These notes provide only an overview of the treatment of poisoning and it is strongly recommended that either **TOXBASE** or the **UK National Poisons Information Service** (see below) be consulted when there is doubt about the degree of risk or about appropriate management.

Most childhood poisoning is accidental. Other causes include intentional overdose, drug abuse, iatrogenic and deliberate poisoning. The drugs most commonly involved in childhood poisoning are paracetamol, ibuprofen, orally ingested creams, aspirin, iron preparations, cough medicines, and the contraceptive pill.

Hospital admission Children who have features of poisoning should generally be admitted to hospital. Children who have taken poisons with delayed actions should also be admitted, even if they appear well. Delayed-action poisons include aspirin, iron, paracetamol, tricyclic antidepressants, and co-phenotrope (diphenoxylate with atropine, *Lomotil*[®]); the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information and advice

TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the Internet to registered users at www.toxbase.org. It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the **UK National Poisons Information Service** on the following number:

Tel: 0844 892 0111

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service.

Help with identifying capsules or tablets may be available from a regional medicines information centre (see inside front cover).

General care

It is often impossible to establish with certainty the identity of the poison and the size of the dose. Fortunately this is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few children require active removal of the poison. In most children, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned child and from their carers. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses, and children should be assessed carefully. Accidents may involve a number of domestic and industrial products (the contents of which are not generally known). The **National Poisons Information Service** should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration

Respiration is often impaired in unconscious children. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in children with reduced consciousness to

prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in children whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such children should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

Respiratory stimulants do not help and should be **avoided**.

The potential for pulmonary aspiration of gastric contents should be considered.

Blood pressure

Hypotension is common in severe poisoning with central nervous system depressants; if severe this may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by tilting down the head of the bed and administration of either sodium chloride intravenous infusion or a colloidal infusion. Vasoconstrictor sympathomimetics (section 2.7.2) are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amphetamines, phencyclidine, and cocaine.

Heart

Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities. Ventricular arrhythmias that cause serious hypotension may require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the child reaches hospital.

Body temperature

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia is best treated by wrapping the patient (e.g. in a 'space blanket') to conserve body heat.

Hyperthermia can develop in children taking CNS stimulants; children are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation; iced water should **not** be used. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require **urgent** hospitalisation for assessment and supportive treatment.

Convulsions

Single short-lived convulsions do not require treatment. If convulsions are protracted or recur frequently, lorazepam 100 micrograms/kg (max. 4 mg) or diazepam (preferably as emulsion) 300–400 micrograms/kg (max. 20 mg) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is

not readily available, diazepam can be administered as a rectal solution or midazolam [unlicensed use] can be given by the buccal route (section 4.8.2).

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

Removal and elimination

Prevention of absorption Given by mouth, **activated charcoal** can adsorb many poisons in the gastro-intestinal system, thereby *reducing their absorption*. The **sooner** it is given the **more effective** it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is relatively safe and is particularly useful for the prevention of absorption of poisons that are toxic in small amounts such as antidepressants.

A second dose may occasionally be required when blood-drug concentration continues to rise suggesting delayed drug release or delayed gastric emptying.

For the use of charcoal in active elimination techniques, see below.

Active elimination techniques Repeated doses of **activated charcoal** by mouth may *enhance the elimination* of some drugs after they have been absorbed; repeated doses are given after overdose with:

Carbamazepine	Quinine
Dapsone	Theophylline
Phenobarbital	

Vomiting should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for salicylates, phenobarbital, methyl alcohol (methanol), ethylene glycol, and lithium
- alkalinisation of the urine for salicylates.

Removal from the gastro-intestinal tract Gastric lavage is rarely required as benefit rarely outweighs risk; advice should be sought from the National Poisons Information Service if a significant quantity of iron or lithium has been ingested within the previous hour.

Whole bowel irrigation (by means of a bowel cleansing solution) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with lithium salts, and if illicit drugs are carried in the gastro-intestinal tract ('body-packing'). However, it is not clear that the procedure improves outcome and advice should be sought from a poisons information centre.

The administration of **laxatives** alone has no role in the management of the poisoned child and is not a recommended method of gut decontamination. The routine use of a laxative in combination with activated charcoal has mostly been abandoned. Laxatives should not be administered to young children because of the likelihood of fluid and electrolyte imbalance.

CHARCOAL, ACTIVATED

Cautions drowsy or comatose child (risk of aspiration); reduced gastro-intestinal motility (risk of obstruction); **not** for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, and metal salts including iron and lithium salts

Contra-indications unprotected airway; gastro-intestinal tract not intact

Side-effects black stools

Indication and dose

Reduction of absorption of poisons

- By mouth

Neonate 1 g/kg

Child 1 month–12 years 1 g/kg (max. 50 g)

Child 12–18 years 50 g

☐ CHARCOAL, ACTIVATED (*continued*)

Active elimination of poisons

• By mouth

Neonate 1 g/kg every 4 hours

Child 1 month–12 years 1 g/kg (max. 50 g) every 4 hours

Child 12–18 years 50 g every 4 hours

Administration suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste

Actidose-Aqua® Advance (Cambridge)

Oral suspension, activated charcoal 1.04 g/5 mL, net price 50-g pack (240 mL) = £8.69

Carbomix® (Beacon)

Powder, activated charcoal, net price 25-g pack = £8.50, 50-g pack = £11.90

Charcodote® (PLIVA)

Oral suspension, activated charcoal 1 g/5 mL, net price 50-g pack = £11.88

Specific drugs

Alcohol

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur in children and some adults. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

Analgesics (non-opioid)

Aspirin The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes (particularly potassium) can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in children, and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is low below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre) unless there is evidence of metabolic acidosis. Activated charcoal should be given within 1 hour of ingesting more than 125 mg/kg aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is maintained within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5); treatment should be given in a high dependency unit.

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis, convulsions, renal failure, pulmonary oedema or persistently high plasma-salicylate concentrations unresponsive to urinary alkalinisation.

NSAIDs Mefenamic acid has important consequences in overdose because it can cause convulsions, which if prolonged or recurrent, require treatment with intravenous lorazepam or diazepam.

Overdose with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Activated charcoal followed by symptomatic measures are indicated if more than 400 mg/kg has been ingested within the preceding hour.

Paracetamol Single or repeated doses totalling as little as 150 mg/kg of paracetamol taken within 24 hours may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Children at *high-risk* of liver damage, including those taking enzyme-inducing drugs or who are malnourished (see below), may develop liver toxicity with as little as 75 mg/kg of paracetamol taken within 24 hours. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after ingestion and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death.

Therefore, despite a lack of significant early symptoms, patients who have taken an overdose of paracetamol should be transferred to hospital **urgently**.

Administration of activated charcoal should be considered if paracetamol in excess of 150 mg/kg (or in excess of 75 mg/kg for those considered to be at *high-risk*, see below) is thought to have been ingested within the previous hour.

Acetylcysteine protects the liver if infused within 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines sharply; if more than 24 hours have elapsed advice should be sought either from the National Poisons Information Service or from a liver unit on the management of serious liver damage. In remote areas, **methionine** by mouth is an alternative only if acetylcysteine cannot be given promptly. Once the child reaches hospital the need to continue treatment with the antidote will be assessed from the plasma-paracetamol concentration (related to the time from ingestion).

Children at risk of liver damage and therefore requiring treatment can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line ('normal treatment line') joining plots of 200 mg/litre (1.32 mmol/litre) at 4 hours and 6.25 mg/litre (0.04 mmol/litre) at 24 hours (see p. 38). Those whose plasma-paracetamol concentration is above the *normal treatment line* are treated with acetylcysteine by intravenous infusion (or, if acetylcysteine is not available, with methionine by mouth, provided the overdose has been taken **within 10–12 hours** and the child is not vomiting).

Children at *high-risk* of liver damage include those:

- taking liver enzyme-inducing drugs (e.g. carbamazepine, phenobarbital, phenytoin, primidone, rifampicin, alcohol, St John's wort);
- who are malnourished (e.g. in anorexia, cystic fibrosis, in underweight children with 'failure to thrive', in alcoholism, or those who are HIV-positive);
- who have a febrile illness;
- who have not eaten for a few days.

These children may develop toxicity at **lower** plasma-paracetamol concentrations and should be treated if the concentration is above the *high-risk treatment line* (which joins plots that are at 50% of the plasma-paracetamol concentrations of the normal treatment line). The prognostic accuracy of plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration above the relevant treatment line should be regarded as carrying a serious risk of liver damage.

The plasma-paracetamol concentration may be difficult to interpret when paracetamol has been ingested over several hours (staggered overdose). If there is doubt about timing or the need for treatment then the child should be treated with acetylcysteine.

See also Co-proxamol, under Analgesics (opioid).

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

Patients whose plasma-paracetamol concentrations are above the **normal treatment line** should be treated with acetylcysteine by intravenous infusion (or, if acetylcysteine cannot be used, with methionine by mouth, provided the overdose has been taken **within 10–12 hours** and the patient is not vomiting).

Children at *high-risk* of liver damage include those:

- taking liver enzyme-inducing drugs (e.g. carbamazepine, phenobarbital, phenytoin, primidone, rifampicin, alcohol, St John's wort);
- who are malnourished (e.g. in anorexia, cystic fibrosis, in underweight children with failure to thrive, in alcoholism, or those who are HIV-positive);
- who have a febrile illness;
- who have not eaten for a few days.

These children should be treated if their plasma-paracetamol concentration is above the **high-risk treatment line**.

The prognostic accuracy after 15 hours is uncertain but a plasma-paracetamol concentration above the relevant treatment line should be regarded as carrying a serious risk of liver damage.

ACETYLCYSTEINE

Cautions asthma (see side-effects below, but do not delay acetylcysteine treatment)

Side-effects hypersensitivity-like reactions managed by reducing infusion rate or suspending

until reaction settled—contact the National Poisons Information Service if reaction severe (rash also managed by giving antihistamine; acute asthma by giving nebulised short-acting beta₂ agonist)

▢ ACETYL-CYSTEINE (continued)

Indication and dose

Paracetamol overdose see notes above

- By intravenous infusion

Neonate initially 150 mg/kg in 3 mL/kg Glucose 5% and given over 15 minutes, followed by 50 mg/kg in 7 mL/kg Glucose 5% and given over 4 hours, then 100 mg/kg in 14 mL/kg Glucose 5% and given over 16 hours

Child 1 month–5 years (or body-weight under 20 kg) initially 150 mg/kg in 3 mL/kg Glucose 5% and given over 15 minutes, followed by 50 mg/kg in 7 mL/kg Glucose 5% and given over 4 hours, then 100 mg/kg in 14 mL/kg Glucose 5% and given over 16 hours

Child 5–12 years (or body-weight over 20 kg) initially 150 mg/kg in 100 mL Glucose 5% and given over 15 minutes, followed by 50 mg/kg in 250 mL Glucose 5% and given over 4 hours,

then 100 mg/kg in 500 mL Glucose 5% and given over 16 hours

Child 12–18 years initially 150 mg/kg (max. 16.5 g) in 200 mL Glucose 5% and given over 15 minutes, followed by 50 mg/kg (max. 5.5 g) in 500 mL Glucose 5% and given over 4 hours, then 100 mg/kg (max. 11 g) in 1 litre Glucose 5% and given over 16 hours

Note Manufacturer also recommends other infusion fluids, but Glucose 5% is preferable

Acetylcysteine (Non-proprietary) (POM)

Injection, acetylcysteine 200 mg/mL, net price 10-mL amp = £2.50

Parvolex® (UCB Pharma) (POM)

Injection, acetylcysteine 200 mg/mL, net price 10-mL amp = £2.50

METHIONINE

Cautions

Hepatic impairment May precipitate coma in hepatic impairment

Side-effects nausea, vomiting, drowsiness, irritability

Indication and dose

Paracetamol overdose see notes above

- By mouth

Child under 6 years 1 g every 4 hours for a total of 4 doses

Child 6–18 years 2.5 g every 4 hours for a total of 4 doses

Methionine (Pharma Nord)

Tablets, f/c, methionine 500 mg, net price 20-tab pack = £9.95

Methionine (UCB Pharma)

Tablets, DL-methionine 250 mg, net price 200-tab pack = £87.76

Analgesics (opioid)

Opioids (narcotic analgesics) cause varying degrees of coma, respiratory depression, and pinpoint pupils. The specific antidote **naloxone** is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. All children should be observed for at least 6 hours after the last dose of naloxone. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone. Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Co-proxamol A combination of dextropropoxyphene and paracetamol (co-proxamol) taken in overdose is much more likely to cause death than a combination of other opioids and paracetamol. The initial features are those of acute opioid overdose with coma, respiratory depression, and pinpoint pupils. Patients may die of acute cardiovascular collapse before reaching hospital (particularly if alcohol has also been consumed) unless adequately resuscitated.

Naloxone reverses the opioid effects of dextropropoxyphene; the long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required. Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with **sodium bicarbonate**, or **magnesium sulphate**, or both; arrhythmias may occur for up to 12 hours. Paracetamol hepatotoxicity may develop later and should be anticipated and treated as indicated above.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

NALOXONE HYDROCHLORIDE

Cautions physical dependence on opioids; cardiac irritability; naloxone is short-acting, see notes above

Indication and dose

Safe Practice Doses used in acute opioid overdose may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use; see also section 15.1.7 for management of postoperative respiratory depression

Overdose with opioids• **By intravenous injection**

Neonate 10 micrograms/kg; if no response give subsequent dose of 100 micrograms/kg (then review diagnosis); further doses may be required if respiratory function deteriorates

Child 1 month–12 years 10 micrograms/kg; if no response give subsequent dose of 100 micrograms/kg (then review diagnosis); further doses may be required if respiratory function deteriorates

Child 12–18 years 0.4–2 mg; if no response repeat at intervals of 2–3 minutes to a max. of 10 mg (then review diagnosis); further doses may be required if respiratory function deteriorates

- **By subcutaneous or intramuscular injection**
As intravenous injection but only if intravenous route not feasible (onset of action slower)
- **By continuous intravenous infusion using an infusion pump**

Neonate 5–20 micrograms/kg/hour, adjusted according to response

Child 1 month–12 years 5–20 micrograms/kg/hour, adjusted according to response

Child 12–18 years initially 0.24–1.2 mg infused over 1 hour, then using a solution of 4 micrograms/mL infuse at a rate adjusted according to response

Reversal of postoperative respiratory depression, reversal of respiratory and CNS depression in neonate following maternal opioid use during labour section 15.1.7

Administration for *continuous intravenous infusion*, dilute to a concentration of 4 micrograms/mL with Glucose 5% or Sodium Chloride 0.9% infusion

Naloxone (Non-proprietary) (PoM)

Injection, naloxone hydrochloride 400 micrograms/mL, net price 1-mL amp = £4.10; 1 mg/mL, 2-mL pre-filled syringe = £6.61

Minijet® Naloxone (UCB Pharma) (PoM)

Injection, naloxone hydrochloride 400 micrograms/mL, net price 1-mL disposable syringe = £9.00, 2-mL disposable syringe = £11.78, 5-mL disposable syringe = £11.53

Antidepressants

Tricyclic and related antidepressants Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations, are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by *tricyclic and related antidepressants* but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious children but large doses may be required.

Selective serotonin re-uptake inhibitors (SSRIs) Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or buccal midazolam [unlicensed use] (see p.34). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

Antimalarials

Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include the torsade de pointes (which can have a very rapid onset) and convulsions (which can be intractable).

Beta-blockers

Therapeutic overdoses with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in children with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de pointes type). The effects of massive overdosage can vary from one beta-blocker to another; propranolol overdosage in particular may cause coma and convulsions.

Acute massive overdosage must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine is required to treat bradycardia and hypotension (40 micrograms/kg, max. 3 mg). Cardiogenic shock unresponsive to atropine is probably best treated with an intravenous injection of glucagon (50–150 micrograms/kg, max. 10 mg) [unlicensed indication and dose] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion of 50 micrograms/kg/hour. If glucagon is not available, intravenous isoprenaline (available from 'special-order' manufacturers or specialist importing companies, see p. 943) is an alternative. A cardiac pacemaker can be used to increase the heart rate.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

Calcium-channel blockers

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Activated charcoal should be considered if the child presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved (although activated charcoal may be effective beyond 1 hour with modified-release preparations). In children with significant features of poisoning, calcium chloride or calcium gluconate (section 9.5.1.1) is given by injection; atropine is given to correct symptomatic bradycardia. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression and advice should be sought from the National Poisons Information Service.

Hypnotics and anxiolytics

Benzodiazepines Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, and occasionally minor and short-lived depression of consciousness. They potentiate the effects of other central nervous system depressants taken concomitantly. Activated charcoal can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the child is awake and the airway is protected. Use of the benzodiazepine antagonist flumazenil can be hazardous,

particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil should be used on **expert advice** only.

Iron salts

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension, coma and hepatocellular necrosis can occur later. Coma and shock indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with **desferrioxamine**, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine given to chelate absorbed iron in excess of the expected iron binding capacity. In **severe toxicity** intravenous desferrioxamine should be given *immediately* without waiting for the result of the serum-iron measurement.

DEFERRIOXAMINE MESILATE

(Deferoxamine Mesilate)

Cautions section 9.1.3

Side-effects section 9.1.3

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Iron poisoning

- By continuous intravenous infusion

Neonate up to 15 mg/kg/hour, reduced after 4–6 hours; max. 80 mg/kg in 24 hours (in severe cases, higher doses on advice from the National Poisons Information Service)

Child 1 month–18 years up to 15 mg/kg/hour, reduced after 4–6 hours; max. 80 mg/kg in 24 hours (in severe cases, higher doses on advice from the National Poisons Information Service)

Chronic iron overload section 9.1.3

Preparations

Section 9.1.3

Lithium

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug due to a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) due to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes due to the child's depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic lithium concentrations are within the range of 0.4–1.0 mmol/litre; concentrations in excess of 2.0 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage, much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake, but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service, p. 33.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

Phenothiazines and related drugs

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine (section 4.9.2) or diazepam (section 4.8.2, emulsion preferred).

Atypical antipsychotic drugs

Features of poisoning by atypical antipsychotic drugs (section 4.2.1) include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Activated charcoal can be given within 1 hour of ingesting a significant quantity of an atypical antipsychotic drug.

Stimulants

Amphetamines These cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam or lorazepam; advice should be sought from the National Poisons Information Service (p. 33) on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam to control agitation and cooling measures for hyperthermia (see p. 34); hypertension and cardiac effects require specific treatment and expert advice should be sought.

Ecstasy Ecstasy (methylenedioxyamfetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use and syndrome of inappropriate antidiuretic hormone secretion (SIADH) can occur.

Treatment of methylenedioxyamfetamine poisoning is supportive, with diazepam to control severe agitation or persistent convulsions and close monitoring including ECG. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

'Liquid ecstasy' is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

Theophylline

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron (section 4.6) may be effective for severe vomiting that is resistant

to other antiemetics. Hypokalaemia is corrected by intravenous infusion of potassium chloride in 0.9% sodium chloride and may be so severe as to require high doses under ECG monitoring. Convulsions should be controlled by intravenous administration of diazepam (emulsion preferred). Sedation with lorazepam or diazepam (emulsion preferred) may be necessary in agitated children.

Provided the child does **not** suffer from asthma, a short-acting beta-blocker (section 2.4) can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

Other poisons

Consult either the National Poisons Information Service day and night or TOX-BASE, see p. 33.

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

Cyanides

Oxygen should be administered to children with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning. Dicobalt edetate itself is toxic, associated with anaphylactic reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite followed by sodium thiosulphate is an alternative if dicobalt edetate is not available.

Hydroxocobalamin can be considered for victims of smoke inhalation who show signs of significant cyanide poisoning. The usual dose is 70 mg/kg (max. 5 g) by intravenous infusion (given once or twice according to severity). *Cyanokit*[®] provides hydroxocobalamin 2.5 g/bottle (no other preparation of hydroxocobalamin is suitable)—contact the National Poisons Information Service for advice.

DICOBALT EDETATE

Cautions owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness; **not** to be used as a precautionary measure

Side-effects hypotension, tachycardia, and vomiting; anaphylactic reactions including facial and laryngeal oedema and cardiac abnormalities

Indication and dose

Severe poisoning with cyanides

• By intravenous injection

Consult the National Poisons Information Service

¹Dicobalt Edetate (Cambridge) ^(PoM)

Injection, dicobalt edetate 15 mg/mL, net price 20-mL (300-mg) amp = £13.75

- ^(PoM) restriction does not apply where administration is for saving life in emergency

SODIUM NITRITE

Side-effects flushing and headache due to vasodilatation

Indication and dose

Poisoning with cyanides (used in conjunction with sodium thiosulphate)

See under preparation

¹Sodium Nitrite ^(PoM)

Injection, sodium nitrite 3% (30 mg/mL) in water for injections

Dose

• By intravenous injection over 5–20 minutes

Child 1 month–18 years 4–10 mg/kg max. 300 mg (0.13–0.33 mL/kg, max. 10 mL, of 3% solution) followed by sodium thiosulphate injection 400 mg/kg, max. 12.5 g (0.8 mL/kg, max. 25 mL, of 50% solution) over 10 minutes

Available from 'special-order' manufacturers or specialist importing companies, see p. 943

- ^(PoM) restriction does not apply where administration is for saving life in emergency

SODIUM THIOSULPHATE

Indication and dose

Poisoning with cyanides (used in conjunction with sodium nitrite)

See above under Sodium Nitrite

¹ Sodium Thiosulphate ^(PoM)

Injection, sodium thiosulphate 50% (500 mg/mL) in water for injections

Available from 'special-order' manufacturers or specialist importing companies, see p.943

- ^(PoM) restriction does not apply where administration is for saving life in emergency

Ethylene glycol and methanol

Fomepizole (available from 'special-order' manufacturers or specialist importing companies, see p.943) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanol (by mouth or by intravenous infusion) can be used with caution in children. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metals

Heavy metal antidotes include dimercaprol and sodium calcium edetate. Other antidotes include succimer (DMSA) and unithiol (DMPS) [both unlicensed]; they may be useful in certain cases of heavy metal poisoning but the advice of the National Poisons Information Service should be sought.

DIMERCAPROL

(BAL)

Cautions hypertension, pregnancy and breast-feeding; **interactions:** Appendix 1 (dimercaprol)

Renal impairment discontinue or use with extreme caution if impairment develops during treatment

Contra-indications not indicated for iron, cadmium, or selenium poisoning; severe hepatic impairment (unless due to arsenic poisoning)

Side-effects hypertension, tachycardia, malaise, nausea, vomiting, salivation, lacrimation, sweating, burning sensation (mouth, throat, and eyes), feeling of constriction of throat and chest, headache, muscle spasm, abdominal pain, tingling of extremities; pyrexia; local pain and abscess at injection site

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Poisoning by antimony, arsenic, bismuth, gold, mercury

• By intramuscular injection

Child 1 month–18 years 2.5–3 mg/kg every 4 hours for 2 days, 2–4 times on the third day, then 1–2 times daily for 10 days or until recovery

Dimercaprol (Sovereign) ^(PoM)

Injection, dimercaprol 50 mg/mL. Net price 2-mL amp = £42.73

Note Contains arachis (peanut) oil as solvent

SODIUM CALCIUM EDETATE

(Sodium Calciusedetate)

Cautions renal impairment

Side-effects nausea, diarrhoea, abdominal pain, pain at site of injection, thrombophlebitis if given too rapidly, renal damage particularly in over-dosage; hypotension, lacrimation, myalgia, nasal congestion, sneezing, malaise, thirst, fever, chills, headache and zinc depletion also reported

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Lead poisoning

• By intravenous infusion

Child 1 month–18 years 40 mg/kg twice daily for up to 5 days; if necessary a second course

can be given at least 7 days after the first course, and a third course can be given at least 7 days after the second course

Administration for *intravenous infusion*, dilute to a concentration of not more 30 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 hour

Ledclair[®] (Durbin) ^(PoM)

Injection, sodium calcium edetate 200 mg/mL, net price 5-mL amp = £7.29

Noxious gases

Carbon monoxide Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The child should be moved to fresh air, the airway cleared, and high-flow **oxygen** 100% administered as soon as available. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The child should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol (section 2.2.5). Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%, or is pregnant.

Sulphur dioxide, chlorine, phosgene, ammonia All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Children are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS Spray

CS spray, which is used for riot control, irritates the eyes (hence 'tear gas') and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agents

Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning (see below), but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits ('NAAS pods') containing **pralidoxime** can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

Pesticides

Organophosphorus insecticides Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secre-

tions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the child to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. **Atropine** will reverse the muscarinic effects of acetylcholine and is given intravenously in a dose of 20 micrograms/kg (max. 2 mg) as atropine sulphate every 5 to 10 minutes (according to the severity of poisoning) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride, a cholinesterase reactivator, is used as an adjunct to atropine in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service (see p. 33).

PRALIDOXIME CHLORIDE

Cautions renal impairment, myasthenia gravis

Contra-indications poisoning with carbamates or organophosphorus compounds without anticholinesterase activity

Side-effects drowsiness, dizziness, disturbances of vision, nausea, tachycardia, headache, hyperventilation, and muscular weakness

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent

- By intravenous infusion over 20 minutes

Child under 18 years initially 30 mg/kg, followed by 8 mg/kg/hour; usual max. 12 g in 24 hours

Note The loading dose may be administered by intravenous injection (diluted to a concentration of

50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion; pralidoxime chloride doses may differ from those in product literature

¹Pralidoxime chloride (PoM)

Injection, powder for reconstitution pralidoxime chloride 1 g/vial

Available as *Protopam*[®] (from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh Ambulance Services for Mid West and South East Wales) — see TOXBASE for list of designated centres)

1. (PoM) restriction does not apply where administration is for saving life in emergency

Snake bites and animal stings

Snake bites Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (*Vipera berus*). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with **adrenaline (epinephrine)** (section 3.4.3). Indications for antivenom treatment include systemic envenoming, especially hypotension (see above), ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. The contents of one vial (10 mL) of **European viper venom antiserum** (available from Movianto) is given by intravenous injection over 10–15 minutes or by intravenous infusion over 30 minutes after diluting in sodium chloride intravenous infusion 0.9% (use 5 mL diluent/kg body-weight). The **same dose** should be used for **adults and children**. The dose can be repeated in 1–2 hours if symptoms of **systemic envenoming** persist. For children who present with clinical features of

severe envenoming (e.g. shock, ECG abnormalities, and rapidly advancing local swelling), an initial dose of 2 vials (20 mL) of the antiserum is recommended. Adrenaline (epinephrine) injection must be immediately to hand for treatment of anaphylactic reactions to the antivenom (for the management of anaphylaxis see section 3.4.3).

Antivenom is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service (Tel: 0844 892 0111).

Insect stings Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible. Anaphylactic reactions require immediate treatment with intramuscular **adrenaline (epinephrine)**; self-administered (or administered by a carer) intramuscular adrenaline (e.g. *EpiPen*[®]) is the best first-aid treatment for children with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions. For the management of anaphylaxis, see section 3.4.3. A short course of an **oral antihistamine** or a **topical corticosteroid** may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of severe anaphylaxis and systemic reactions in children with systemic hypersensitivity to bee or wasp stings (section 3.4.2).

Marine stings The severe pain of weeverfish (*Trachinus vipera*) and Portuguese man-o'-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). Children stung by jellyfish and Portuguese man-o'-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater. Alcoholic solutions, including suntan lotions, should **not** be applied because they can cause further discharge of stinging hairs. Ice packs will reduce pain and a slurry of baking soda (sodium bicarbonate), but not vinegar, may be useful for treating stings from UK species.

The **National Poisons Information Service** (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

This chapter includes advice on the drug management of the following:

- Clostridium difficile* infection, p. 68
- constipation, p. 77
- Crohn's disease, p. 66
- food allergy, p. 76
- Helicobacter pylori* infection, p. 59
- irritable bowel syndrome, p. 68
- malabsorption syndromes, p. 68
- NSAID-associated ulcers, p. 60
- ulcerative colitis, p. 66

1.1 Dyspepsia and gastro-oesophageal reflux disease

1.1.1 Antacids and simeticone

1.1.2 Compound alginate preparations

Dyspepsia

Dyspepsia covers pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration (section 1.3), gastro-oesophageal reflux disease, gastritis, and upper gastro-intestinal motility disorders, but most commonly it is of uncertain origin.

Children with dyspepsia should be advised about lifestyle changes (see Gastro-oesophageal reflux disease, below). Some medications may cause dyspepsia—these should be stopped, if possible.

A compound alginate preparation (section 1.1.2) may provide relief from dyspepsia; persistent dyspepsia requires investigation. Treatment with a H_2 -receptor antagonist (section 1.3.1) or a proton pump inhibitor (section 1.3.5) should be initiated only on the advice of a hospital specialist.

Helicobacter pylori may be present in children with dyspepsia. *H. pylori* eradication therapy (section 1.3) should be considered for persistent dyspepsia if it is ulcer-like. However, most children with functional (investigated, non-ulcer) dyspepsia do not benefit symptomatically from *H. pylori* eradication.

Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease includes non-erosive gastro-oesophageal reflux and erosive oesophagitis. Uncomplicated gastro-oesophageal reflux is common in infancy and most symptoms, such as intermittent vomiting or repeated, effortless regurgitation, resolve without treatment between 12 and 18 months of age. Older children with gastro-oesophageal reflux disease may have heartburn, acid regurgitation and dysphagia. Oesophageal inflammation (oesophagitis), ulceration or stricture formation may develop in early childhood; gastro-oesophageal reflux disease may also be associated with chronic respiratory disorders including asthma.

Parents and carers of *neonates* and *infants* should be reassured that most symptoms of uncomplicated gastro-oesophageal reflux resolve without treatment. An increase in the frequency and a decrease in the volume of feeds may reduce symptoms. A feed thickener or pre-thickened formula feed (Appendix 2) can be used on the advice of a dietician. If necessary, a suitable alginate-containing preparation (section 1.1.2) can be used instead of thickened feeds.

Older children should be advised about life-style changes such as weight reduction if overweight, and the avoidance of alcohol and smoking. An alginate-containing antacid (section 1.1.2) can be used to relieve symptoms.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital. On the advice of a paediatrician, a **histamine H_2 -receptor antagonist** (section 1.3.1) can be used to relieve symptoms of gastro-oesophageal reflux disease,

promote mucosal healing and permit reduction in antacid consumption. A **proton pump inhibitor** (section 1.3.5) can be used for the treatment of moderate, non-erosive oesophagitis that is unresponsive to an H₂-receptor antagonist. Endoscopically confirmed *erosive, ulcerative, or stricturing* disease in children is usually treated with a proton pump inhibitor. Reassessment is necessary if symptoms persist despite 4–6 weeks of treatment; long-term use of an H₂-receptor antagonist or proton pump inhibitor should not be undertaken without full assessment of the underlying condition. For endoscopically confirmed *erosive, ulcerative, or stricturing* disease, the proton pump inhibitor usually needs to be maintained at the minimum effective dose.

Motility stimulants (section 1.2), such as domperidone or erythromycin may improve gastro-oesophageal sphincter contraction and accelerate gastric emptying. Evidence for the long-term efficacy of motility stimulants in the management of gastro-oesophageal reflux in children is unconvincing.

For advice on specialised formula feeds, see section 9.4.2.

1.1.1 Antacids and simeticone

Antacids (usually containing aluminium or magnesium compounds) can be used for short-term relief of intermittent symptoms of *ulcer dyspepsia* and *non-erosive gastro-oesophageal reflux* (see section 1.1) in children; they are also used in functional (non-ulcer) dyspepsia, but the evidence of benefit is uncertain.

Aluminium- and magnesium-containing antacids, being relatively insoluble in water, are long-acting if retained in the stomach. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects. Aluminium-containing antacids should not be used in children with renal impairment, or in neonates and infants because accumulation may lead to increased plasma-aluminium concentrations.

Complexes such as **hydrotalcite** confer no special advantage.

Calcium-containing antacids can induce rebound acid secretion; with modest doses the clinical significance of this is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis.

Simeticone (activated dimeticone) is used to treat infantile colic, but the evidence of benefit is uncertain. Simeticone is added to an antacid as an antifoaming agent to relieve flatulence; such preparations may also be useful for the relief of hiccup in palliative care (see Prescribing in Palliative Care, p. 27).

Alginates act as mucosal protectants in gastro-oesophageal reflux disease (section 1.1.2). The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

Interactions Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may also damage enteric coatings designed to prevent dissolution in the stomach. See also **Appendix 1** (antacids, calcium salts).

Low Na⁺

The words 'low Na⁺' added after some preparations indicate a sodium content of less than 1 mmol per tablet or 10-mL dose.

Aluminium- and magnesium-containing antacids

ALUMINIUM HYDROXIDE

Cautions see notes above; **interactions:** Appendix 1 (antacids)

Renal impairment risk of aluminium accumulation and aluminium toxicity. Absorption of aluminium from aluminium salts is increased by

citrates, which are contained in many effervescent preparations

Pregnancy use with caution especially in first trimester

Contra-indications hypophosphataemia; neonates and infants

□ ALUMINIUM HYDROXIDE (*continued*)

Side-effects see notes above

Indication and dose

Dyspepsia for dose see preparations

Hyperphosphataemia section 9.5.2.2

▲ **Co-magaldrox**

Co-magaldrox is a mixture of aluminium hydroxide and magnesium hydroxide; the proportions are expressed in the form x/y where x and y are the strengths in milligrams per unit dose of magnesium hydroxide and aluminium hydroxide respectively

Maalox® (Sanofi-Aventis)

Suspension, sugar-free, co-magaldrox 195/220 (magnesium hydroxide 195 mg, dried aluminium

hydroxide 220 mg/5 mL (low Na⁺). Net price 500 mL = £2.79

Dose

- By mouth

Child 14–18 years 10–20 mL 20–60 minutes after meals and at bedtime, or when required

Mucogel® (Chemidex)

Suspension, sugar-free, co-magaldrox 195/220 (magnesium hydroxide 195 mg, dried aluminium hydroxide 220 mg/5 mL (low Na⁺)). Net price 500 mL = £1.71

Dose

- By mouth

Child 12–18 years 10–20 mL 3 times daily, 20–60 minutes after meals and at bedtime, or when required

MAGNESIUM TRISILICATE

Cautions heart failure, hypertension; metabolic or respiratory alkalosis, hypermagnesaemia; **interactions:** Appendix 1 (antacids)

Renal impairment increased risk of toxicity—avoid or reduce dose. Magnesium trisilicate mixture has a high sodium content

Pregnancy use with caution especially in first trimester; avoid antacid preparations containing high sodium content

Contra-indications severe renal failure; hypophosphataemia

Side-effects see notes above; silica-based renal stones reported on long-term treatment

Indication and dose

Dyspepsia for dose see under preparation

Magnesium Trisilicate Mixture, BP

(Magnesium Trisilicate Oral Suspension)

Oral suspension, 5% each of magnesium trisilicate, light magnesium carbonate, and sodium bicarbonate in a suitable vehicle with a peppermint flavour. Contains about 6 mmol Na⁺/10 mL

Dose

- By mouth

Child 5–12 years 5–10 mL with water 3 times daily or as required

Child 12–18 years 10–20 mL with water 3 times daily or as required

Aluminium-magnesium complexes

HYDROTALCITE

Aluminium magnesium carbonate hydroxide hydrate

Cautions see notes above; **interactions:** Appendix 1 (antacids)

Side-effects see notes above

Indication and dose

Dyspepsia for dose see under preparation

Hydrotalcite (Peckforton)

Suspension, hydrotalcite 500 mg/5 mL (low Na⁺). Net price 500-mL pack = £1.96

Note The brand name *Altacite*®  is used for hydrotalcite suspension; for *Altacite Plus*® suspension, see below

Dose

- By mouth

Child 6–12 years 5 mL 4 times daily (between meals and at bedtime)

Child 12–18 years 10 mL 4 times daily (between meals and at bedtime)

Antacid preparations containing simeticone

Altacite Plus® (Peckforton)

Suspension, sugar-free, co-simalcite 125/500 (simeticone 125 mg, hydrotalcite 500 mg)/5 mL (low Na⁺). Net price 500 mL = £1.96

Dose

- By mouth

Child 8–12 years 5 mL 4 times daily (between meals and at bedtime) when required

Child 12–18 years 10 mL 4 times daily (between meals and at bedtime) when required

Asilone® (Thornton & Ross)

Suspension, sugar-free, dried aluminium hydroxide 420 mg, simeticone 135 mg, light magnesium oxide 70 mg/5 mL (low Na⁺). Net price 500 mL = £1.95

Dose

• By mouth

Child 12–18 years 5–10 mL after meals and at bedtime or when required up to 4 times daily

Maalox Plus® (Sanofi-Aventis)

Suspension, sugar-free, dried aluminium hydroxide 220 mg, simeticone 25 mg, magnesium hydroxide 195 mg/5 mL (low Na⁺). Net price 500 mL = £2.79

Dose

• By mouth

Child 2–5 years 5 mL 3 times daily

Child 5–12 years 5–10 mL 3–4 times daily

Child 12–18 years 5–10 mL 4 times daily (after meals and at bedtime) or when required

Simeticone alone**SIMETICONE**

Activated dimeticone

Indication and dose

Colic or wind pain for dose see under individual preparations

Dentinox® (DDD) 

Colic drops (= emulsion), simeticone 21 mg/2.5-mL dose. Net price 100 mL = £1.73

Dose

• By mouth

Neonate 2.5 mL with or after each feed (max. 6 doses in 24 hours); may be added to bottle feed

Child 1 month–2 years 2.5 mL with or after each feed (max. 6 doses in 24 hours); may be added to bottle feed

Note The brand name *Dentinox®* is also used for other preparations including teething gel

Infacol® (Forest) 

Liquid, sugar-free, simeticone 40 mg/mL (low Na⁺). Net price 50 mL = £2.26. Counselling, use of dropper

Dose

• By mouth

Neonate 0.5–1 mL before feeds

Child 1 month–2 years 0.5–1 mL before feeds

1.1.2 Compound alginate preparations

Alginate taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginate-containing preparations form a viscous gel ('raft') that floats on the surface of the stomach contents, thereby reducing symptoms of reflux. Alginate-containing preparations are used in the management of mild symptoms of dyspepsia and gastro-oesophageal reflux disease (see section 1.1). Antacids may damage enteric coatings designed to prevent dissolution in the stomach. For **interactions**, see Appendix 1 (antacids, calcium salts).

Preparations containing aluminium should not be used in children with renal impairment, or in neonates and infants.

Alginate raft-forming oral suspensions

The following preparations contain sodium alginate, sodium bicarbonate, and calcium carbonate in a suitable flavoured vehicle, and conform to the specification for Alginate Raft-forming Oral Suspension, BP.

Acidex® (Pinewood)

Liquid, sugar-free, sodium alginate 250 mg, sodium bicarbonate 133.5 mg, calcium carbonate 80 mg/5 mL. Contains about 3 mmol Na⁺/5 mL, net price 500 mL (aniseed- or peppermint-flavour) = £1.70

Dose

• By mouth

Child 6–12 years 5–10 mL after meals and at bedtime

Child 12–18 years 10–20 mL after meals and at bedtime

Peptac® (IVAX)

Suspension, sugar-free, sodium bicarbonate 133.5 mg, sodium alginate 250 mg, calcium carbonate 80 mg/5 mL. Contains 3.1 mmol Na⁺/5 mL. Net price 500 mL (aniseed- or peppermint-flavoured) = £2.16

Dose

Child 6–12 years 5–10 mL after meals and at bedtime

Child 12–18 years 10–20 mL after meals and at bedtime

Other compound alginate preparations

Gastrocote® (Actavis)

Tablets, alginic acid 200 mg, dried aluminium hydroxide 80 mg, magnesium trisilicate 40 mg, sodium bicarbonate 70 mg. Contains about 1 mmol Na⁺/tablet. Net price 100-tab pack = £3.51

Cautions diabetes mellitus (high sugar content)

Dose• **By mouth**

Child 6–18 years 1–2 tablets chewed 4 times daily (after meals and at bedtime)

Liquid, sugar-free, peach-coloured, dried aluminium hydroxide 80 mg, magnesium trisilicate 40 mg, sodium alginate 220 mg, sodium bicarbonate 70 mg/5 mL. Contains 2.13 mmol Na⁺/5 mL. Net price 500 mL = £2.67

Dose• **By mouth**

Child 6–18 years 5–15 mL 4 times daily (after meals and at bedtime)

Gaviscon® Advance (R&C)

Tablets, sugar-free, sodium alginate 500 mg, potassium bicarbonate 100 mg. Contains 2.25 mmol Na⁺, 1 mmol K⁺/tablet. Net price 60-tab pack (peppermint-flavour) = £3.24

Excipients include aspartame (section 9.4.1)

Dose• **By mouth**

Child 6–12 years 1 tablet to be chewed after meals and at bedtime (under medical advice only)

Child 12–18 years 1–2 tablets to be chewed after meals and at bedtime

Suspension, sugar-free, aniseed- or peppermint-flavour, sodium alginate 500 mg, potassium bicarbonate 100 mg/5 mL. Contains 2.3 mmol Na⁺, 1 mmol K⁺/5 mL, net price 250 mL = £2.70, 500 mL = £5.40

Dose• **By mouth**

Child 2–12 years 2.5–5 mL after meals and at bedtime (under medical advice only)

Child 12–18 years 5–10 mL after meals and at bedtime

Gaviscon® Infant (R&C)

Oral powder, sugar-free, sodium alginate 225 mg, magnesium alginate 87.5 mg, with colloidal silica and mannitol/dose (half dual-sachet). Contains 0.92 mmol Na⁺/dose. Net price 15 dual-sachets (30 doses) = £2.46

Dose• **By mouth**

Neonate body-weight under 4.5 kg 1 'dose' (half dual-sachet) mixed with feeds (or water, for breast-fed infants) when required (max. 6 times in 24 hours)

Neonate body-weight over 4.5 kg 2 'doses' (1 dual-sachet) mixed with feeds (or water, for breast-fed infants) when required (max. 6 times in 24 hours)

Child 1 month–2 years

Body-weight under 4.5 kg dose as for neonate
Body-weight over 4.5 kg 2 'doses' (1 dual-sachet) mixed with feeds (or water, for breast-fed infants) when required (max. 6 times in 24 hours)

Note Not to be used in preterm neonates, or where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature), or if intestinal obstruction. Not to be used with other preparations containing thickening agents

Safe Practice Each half of the dual-sachet is identified as 'one dose'. To avoid errors prescribe as 'dual-sachet' with directions in terms of 'dose'

Rennie® Duo (Roche Consumer Health)

Suspension, sugar-free, calcium carbonate 600 mg, magnesium carbonate 70 mg, sodium alginate 150 mg/5 mL. Contains 2.6 mmol Na⁺/5 mL. Net price 500 mL (mint flavour) = £2.67

Dose• **By mouth**

Child 12–18 years 10 mL after meals and at bedtime; an additional 10 mL may be taken between doses for heartburn if necessary, max. 80 mL daily

Excipients include propylene glycol

Topal® (Fabre)

Tablets, alginic acid 200 mg, dried aluminium hydroxide 30 mg, light magnesium carbonate 40 mg with lactose 220 mg, sucrose 880 mg, sodium bicarbonate 40 mg (low Na⁺). Net price 42-tab pack = £1.67

Cautions diabetes mellitus (high sugar content)

Dose• **By mouth**

Child 12–18 years 1–3 tablets chewed 4 times daily (after meals and at bedtime)

1.2 Antispasmodics and other drugs altering gut motility

Drugs in this section include antimuscarinic compounds and drugs believed to be direct relaxants of intestinal smooth muscle. The smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in *irritable bowel syndrome*.

The dopamine-receptor antagonist **domperidone** stimulates transit in the gut.

Antimuscarinics

Antimuscarinics (formerly termed 'anticholinergics') reduce intestinal motility. They are occasionally used for the management of *irritable bowel syndrome* but the evidence of their value has not been established and response varies. Other

indications for antimuscarinic drugs include asthma and airways disease (section 3.1.2), motion sickness (section 4.6), urinary frequency and enuresis (section 7.4.2), mydriasis and cycloplegia (section 11.5), premedication (section 15.1.3), palliative care (p. 26), and as an antidote to organophosphorus poisoning (p. 47).

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amine **dicycloverine hydrochloride** (dicyclomine hydrochloride) and the quaternary ammonium compounds **propantheline bromide** and **hyoscine butylbromide**. The quaternary ammonium compounds are less lipid soluble than atropine and so are less likely to cross the blood-brain barrier; they are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection may be useful in endoscopy and radiology.

Cautions Antimuscarinics should be used with caution in children (especially children with Down's syndrome) due to increased risk of side-effects; they should also be used with caution in hypertension, conditions characterised by tachycardia (including hyperthyroidism, cardiac insufficiency, cardiac surgery), pyrexia, pregnancy, and in children susceptible to angle-closure glaucoma. Antimuscarinics are not used in children with gastro-oesophageal reflux disease, diarrhoea or ulcerative colitis. **Interactions:** Appendix 1 (antimuscarinics).

Contra-indications Antimuscarinics are contra-indicated in myasthenia gravis (but may be used to decrease muscarinic side-effects of anticholinesterases—section 10.2.1), paralytic ileus, and pyloric stenosis.

Side-effects Side-effects of antimuscarinics include constipation, transient bradycardia (followed by tachycardia, palpitation and arrhythmias), reduced bronchial secretions, urinary urgency and retention, dilatation of the pupils with loss of accommodation, photophobia, dry mouth, flushing and dryness of the skin. Side-effects that occur occasionally include nausea, vomiting, and giddiness.

DICYCLOVERINE HYDROCHLORIDE

(Dicyclomine hydrochloride)

Cautions see notes above

Contra-indications see notes above; child under 6 months

Breast-feeding avoid—present in milk; apnoea reported in infant

Side-effects see notes above

Indication and dose

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

• By mouth

Child 6 months–2 years 5–10 mg 3–4 times daily 15 minutes before feeds

Child 2–12 years 10 mg 3 times daily

Child 12–18 years 10–20 mg 3 times daily

Merbentyl[®] (Sanofi-Aventis) (POM)

Tablets, dicycloverine hydrochloride 10 mg, net price 20 = £1.01; 20 mg (*Merbentyl 20*[®]), 84-tab pack = £8.47

Syrup, dicycloverine hydrochloride 10 mg/5 mL, net price 120 mL = £1.84

Note Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg

Compound preparations

Kolanticon[®] (Peckforton)

Gel, sugar-free, dicycloverine hydrochloride 2.5 mg, dried aluminium hydroxide 200 mg, light magnesium oxide 100 mg, simeticone 20 mg/5 mL, net price 200 mL = £2.21, 500 mL = £2.79

Dose

Child 12–18 years 10–20 mL every 4 hours when required

HYOSCINE BUTYLBROMIDE

Cautions see notes above; also intestinal and urinary outlet obstruction

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding amount too small to be harmful

Contra-indications see notes above

Side-effects see notes above

Licensed use *tablets* not licensed for use in children under 6 years; *injection* not licensed for use in children (age range not specified by manufacturer)

▢ HYOSCINE BUTYLBROMIDE (continued)

Indication and dose

Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm

- By mouth

Child 6–12 years 10 mg 3 times daily

Child 12–18 years 20 mg 4 times daily

Excessive respiratory secretions and bowel colic in palliative care (see also p. 28)

- By mouth

Child 1 month–2 years 300–500 micrograms/kg (max. 5 mg) 3–4 times daily

Child 2–5 years 5 mg 3–4 times daily

Child 5–12 years 10 mg 3–4 times daily

Child 12–18 years 10–20 mg 3–4 times daily

- By intramuscular or intravenous injection

Child 1 month–4 years 300–500 micrograms/kg (max. 5 mg) 3–4 times daily

Child 5–12 years 5–10 mg 3–4 times daily

Child 12–18 years 10–20 mg 3–4 times daily

Acute spasm, spasm in diagnostic procedures

- By intramuscular or intravenous injection

Child 2–6 years 5 mg repeated after 30 minutes if necessary (may be repeated more frequently in endoscopy), max. 15 mg daily

Child 6–12 years 5–10 mg repeated after 30 minutes if necessary (may be repeated more frequently in endoscopy), max. 30 mg daily

Child 12–18 years 20 mg repeated after 30 minutes if necessary (may be repeated more frequently in endoscopy), max. 80 mg daily

Administration for intravenous injection, may be diluted with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 minute.

For administration by mouth, injection solution may be used; content of ampoule may be stored in a refrigerator for up to 24 hours after opening

Buscopan® (Boehringer Ingelheim) (POM)

Tablets, coated, hyoscine butylbromide 10 mg, net price 56-tab pack = £2.59

Note Hyoscine butylbromide tablets can be sold to the public provided single dose does not exceed 20 mg, daily dose does not exceed 80 mg, and pack does not contain a total of more than 240 mg

Injection, hyoscine butylbromide 20 mg/mL. Net price 1-mL amp = 20p

PROPRANTHELINE BROMIDE

Cautions see notes above

Hepatic impairment manufacturer advises caution

Renal impairment manufacturer advises caution

Pregnancy manufacturer advises avoid

Breast-feeding may suppress lactation

Contra-indications see notes above

Side-effects see notes above

Licensed use tablets not licensed for use in children under 12 years

Indication and dose

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- By mouth

Child 1 month–12 years 300 micrograms/kg (max. 15 mg) 3–4 times daily at least one hour before food

Child 12–18 years 15 mg 3 times daily at least one hour before meals and 30 mg at night (max. 120 mg daily)

Pro-Banthine® (Concord) (POM)

Tablets, pink, s/c, propantheline bromide 15 mg, net price 112-tab pack = £15.32. Label: 23

▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

Other antispasmodics

Alverine, mebeverine, and peppermint oil are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in irritable bowel syndrome and primary dysmenorrhoea. They have no serious adverse effects; peppermint oil occasionally causes heartburn.

ALVERINE CITRATE

Cautions

Pregnancy caution

Breast-feeding little information available—manufacturer advises avoid

Contra-indications paralytic ileus

Side-effects nausea; headache, dizziness; pruritus, rash; hepatitis also reported

▢ ALVERINE CITRATE (continued)

Indication and dose

Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm, dysmenorrhoea

- By mouth

Child 12–18 years 60–120 mg 1–3 times daily

Spasmonal® (Norgine)

Capsules, alverine citrate 60 mg (blue/grey), net price 100-cap pack = £11.95; 120 mg (*Spasmonal Forte*, blue/grey), 60-cap pack = £13.80

MEBEVERINE HYDROCHLORIDE

Cautions avoid in acute porphyria (section 9.8.2)

Pregnancy not known to be harmful—manufacturers advise caution

Contra-indications paralytic ileus

Side-effects rarely allergic reactions (including rash, urticaria, angioedema)

Licensed use tablets and liquid not licensed for use in children under 10 years; granules not licensed for use in children under 12 years; modified-release capsules not licensed for use in children under 18 years

Indication and dose

Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm

- By mouth

Child 3–4 years 25 mg 3 times daily, preferably 20 minutes before meals

Child 4–8 years 50 mg 3 times daily, preferably 20 minutes before meals

Child 8–10 years 100 mg 3 times daily, preferably 20 minutes before meals

Child 10–18 years 135–150 mg 3 times daily, preferably 20 minutes before meals

¹Mebeverine Hydrochloride (Non-proprietary) (PoM)

Tablets, mebeverine hydrochloride 135 mg, net price 20 = £2.21

Oral suspension, mebeverine hydrochloride (as mebeverine embonate) 50 mg/5 mL. Contains Na⁺ 0.87 mmol/5 mL. Net price 300 mL = £107.00

1. Mebeverine hydrochloride can be sold to the public for children over 10 years, for symptomatic relief of irritable bowel syndrome, provided that max. single dose is 135 mg and max. daily dose is 405 mg

Colofac® (Solvay) (PoM)

Tablets, s/c, mebeverine hydrochloride 135 mg. Net price 20 = £1.50

▀ Modified release

Colofac® MR (Solvay) (PoM)

Capsules, m/r, mebeverine hydrochloride 200 mg, net price 60-cap pack = £6.67. Label: 25

Dose

Irritable bowel syndrome

- By mouth

Child 12–18 years 1 capsule twice daily preferably 20 minutes before food

▀ Compound preparations

¹Fybogel® Mebeverine (R&C) (PoM)

Granules, buff, effervescent, ispaghula husk 3.5 g, mebeverine hydrochloride 135 mg/sachet. Contains 2.5 mmol K⁺/sachet, net price 10 sachets = £2.50. Label: 13, 22, counselling, see below
Excipients include aspartame (section 9.4.1)

Dose

Irritable bowel syndrome

- By mouth

Child 12–18 years 1 sachet in water, morning and evening 30 minutes before food; an additional sachet may also be taken before the midday meal if necessary

- Counselling** Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed
1. 10-sachet pack can be sold to the public for use in children over 12 years

PEPPERMINT OIL

Cautions sensitivity to menthol

Breast-feeding significant levels of menthol in breast milk unlikely

Side-effects heartburn, perianal irritation; rarely, allergic reactions (including rash, headache, bradycardia, muscle tremor, ataxia)

Local irritation Capsules should not be broken or chewed because peppermint oil may irritate mouth or oesophagus

Indication and dose

Relief of abdominal colic and distension, particularly in irritable bowel syndrome

- By mouth

Child 15–18 years 1–2 capsules, swallowed whole with water, 3 times daily for up to 3 months if necessary

Colpermin® (McNeil)

Capsules, e/c, light blue/dark blue, blue band, peppermint oil 0.2 mL. Net price 100-cap pack = £12.05. Label: 5, 25

Excipients include arachis (peanut) oil

Motility stimulants

Domperidone and **metoclopramide** (section 4.6) are dopamine receptor antagonists which stimulate gastric emptying and small intestinal transit, and enhance the strength of oesophageal sphincter contraction. Metoclopramide and occasionally domperidone can cause acute dystonic reactions—for further details of this and other side-effects, see section 4.6.

A low dose of **erythromycin** stimulates gastro-intestinal motility and may be used on the advice of a paediatric gastroenterologist to promote tolerance of enteral feeds; erythromycin may be less effective as a prokinetic drug in preterm neonates than in older children.

DOMPERIDONE

Cautions see under Domperidone (section 4.6)

Side-effects see under Domperidone (section 4.6); also QT-interval prolongation reported

Licensed use not licensed for use in gastro-intestinal stasis; not licensed for use in children for gastro-oesophageal reflux disease

Indication and dose

Gastro-oesophageal reflux disease (but efficacy not proven, see section 1.1), gastro-intestinal stasis

- By mouth

Neonate 100–300 micrograms/kg 4–6 times daily before feeds

Child 1 month–12 years 200–400 micrograms/kg (max. 20 mg) 3–4 times daily before food

Child 12–18 years 10–20 mg, 3–4 times daily before food

Nausea and vomiting section 4.6

▀ **Preparations**

Section 4.6

ERYTHROMYCIN

Cautions see section 5.1.5; **interactions:** Appendix 1 (macrolides)

Side-effects see section 5.1.5

Licensed use not licensed for use in gastro-intestinal stasis

Indication and dose

Gastro-intestinal stasis

- By mouth

Neonate 3 mg/kg 4 times daily

Child 1 month–18 years 3 mg/kg 4 times daily

- By intravenous infusion

Neonate 3 mg/kg 4 times daily

Child 1 month–1 year 3 mg/kg 4 times daily

▀ **Preparations**

Section 5.1.5

1.3 Antisecretory drugs and mucosal protectants

1.3.1 **H₂-receptor antagonists**

1.3.2 **Selective antimuscarinics**

1.3.3 **Chelates and complexes**

1.3.4 **Prostaglandin analogues**

1.3.5 **Proton pump inhibitors**

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma.

Healing can be promoted by general measures, stopping smoking and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by *Helicobacter pylori*.

The management of *H. pylori* infection and of NSAID-associated ulcers is discussed below.

Helicobacter pylori infection

Eradication of *Helicobacter pylori* reduces the recurrence of gastric and duodenal ulcers and the risk of rebleeding. The presence of *H. pylori* should be confirmed before starting eradication treatment. If possible, the antibacterial sensitivity of the organism should be established at the time of endoscopy and biopsy. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of *H. pylori*; reinfection is rare. Antibiotic-associated colitis is an uncommon risk.

Treatment to eradicate *H. pylori* infection in children should be initiated under specialist supervision. One-week triple-therapy regimens that comprise omeprazole, amoxicillin, and either clarithromycin or metronidazole are recommended. Resistance to clarithromycin or to metronidazole is much more common than to amoxicillin and can develop during treatment. A regimen containing amoxicillin and clarithromycin is therefore recommended for initial therapy and one containing amoxicillin and metronidazole for eradication failure. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H₂-receptor antagonist), however, if the ulcer is large, or complicated by haemorrhage or perforation then antisecretory treatment is continued for a further 3 weeks. Lansoprazole may be considered if omeprazole is unsuitable. Treatment failure usually indicates antibacterial resistance, poor compliance, or familial reinfection.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial produce low rates of *H. pylori* eradication and are **not** recommended.

For the role of *H. pylori* eradication therapy in children starting or taking NSAIDs, see NSAID-associated ulcers, below.

Recommended regimens for *Helicobacter pylori* eradication

Eradication therapy	Age range	Oral dose (to be used in combination with omeprazole, section 1.3.5)
Amoxicillin	1–6 years	250 mg twice daily (with clarithromycin)
		125 mg 3 times daily (with metronidazole)
	6–12 years	500 mg twice daily (with clarithromycin)
		250 mg 3 times daily (with metronidazole)
12–18 years	1 g twice daily (with clarithromycin)	
	500 mg 3 times daily (with metronidazole)	
Clarithromycin	1–12 years	7.5 mg/kg (max. 500 mg) twice daily (with metronidazole or amoxicillin)
	12–18 years	500 mg twice daily (with metronidazole or amoxicillin)
Metronidazole	1–6 years	100 mg twice daily (with clarithromycin)
		100 mg 3 times daily (with amoxicillin)
	6–12 years	200 mg twice daily (with clarithromycin)
		200 mg 3 times daily (with amoxicillin)
	12–18 years	400 mg twice daily (with clarithromycin)
400 mg 3 times daily (with amoxicillin)		

Test for *Helicobacter pylori*

¹³C-Urea breath test kits are available for confirming the presence of gastro-duodenal infection with *Helicobacter pylori*. The test involves collection of breath samples before and after ingestion of an oral solution of ¹³C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific ¹³C-Urea breath test kit for children is available (*Helicobacter Test INFAI for children of the age 3–11*[®]). However the appropriateness of testing for *H. pylori* infection in children has not been established. Breath, saliva, faecal, and urine tests for *H. pylori* are frequently unreliable in children; the most accurate method of diagnosis is endoscopy with biopsy.

Helicobacter Test INFAI for children of the age 3–11[®] (InfaI) ^(POM)

Oral powder, ¹³C-urea 45 mg, net price 1 kit (including 4 breath sample containers, straws) = £19.20 (spectrometric analysis included)

Helicobacter Test INFAI[®] (InfaI) ^(POM)

Oral powder, ¹³C-urea 75 mg, net price 1 kit (including 4 breath-sample containers, straws) = £19.20 (spectrometric analysis included); 1 kit (including 2 breath bags) = £14.20 (spectroscopic analysis not included); 50-test set = £855.00 (spectrometric analysis included)

NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use (section 10.1.1). In adults, the risk of serious upper gastro-intestinal side-effects varies between individual NSAIDs (see Gastro-intestinal side-effects, p. 602). Whenever possible, NSAIDs should be **withdrawn** if an ulcer occurs.

Children at high risk of developing gastro-intestinal complications include those with a history of peptic ulcer disease or serious upper gastro-intestinal complication, those taking other medicines that increase the risk of upper gastro-intestinal side-effects, or those with serious co-morbidity. In children at risk of ulceration, a proton pump inhibitor (section 1.3.5) or an H₂-receptor antagonist, such as ranitidine, may be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs.

NSAID use and *H. pylori* infection are independent risk factors for gastro-intestinal bleeding and ulceration. In children already taking a NSAID, eradication of *H. pylori* is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in children about to start long-term NSAID treatment who are *H. pylori* positive and have dyspepsia or a history of gastric or duodenal ulcer, eradication of *H. pylori* may reduce the overall risk of ulceration.

If the NSAID can be discontinued in a child who has developed an ulcer, a proton pump inhibitor usually produces the most rapid healing, alternatively the ulcer can be treated with an H₂-receptor antagonist.

If NSAID treatment needs to continue, the ulcer is treated with a proton pump inhibitor (section 1.3.5).

1.3.1 H₂-receptor antagonists

Histamine H₂-receptor antagonists heal gastric and duodenal ulcers by reducing gastric acid output as a result of histamine H₂-receptor blockade; they are also used to relieve symptoms of dyspepsia and gastro-oesophageal reflux disease (section 1.1). H₂-receptor antagonists should not normally be used for Zollinger–Ellison syndrome because proton pump inhibitors (section 1.3.5) are more effective.

Maintenance treatment with low doses has largely been replaced in *Helicobacter pylori* positive children by eradication regimens (section 1.3).

H₂-receptor antagonist therapy can promote healing of NSAID-associated ulcers (section 1.3).

Treatment with a H₂-receptor antagonist has not been shown to be beneficial in haematemesis and melaena, but prophylactic use reduces the frequency of bleeding from gastroduodenal erosions in hepatic coma, and possibly in other

conditions requiring intensive care. Treatment also reduces the risk of *acid aspiration* in obstetric patients at delivery (Mendelson's syndrome).

H₂-receptor antagonists are also used to reduce the degradation of pancreatic enzyme supplements (section 1.9.4) in children with cystic fibrosis.

Side-effects Side-effects of the H₂-receptor antagonists include diarrhoea and other gastro-intestinal disturbances, altered liver function tests (rarely liver damage), headache, dizziness, rash, and tiredness. Rare side-effects include acute pancreatitis, bradycardia, AV block, confusion, depression, and hallucinations particularly in the very ill, hypersensitivity reactions (including fever, arthralgia, myalgia, anaphylaxis), blood disorders (including agranulocytosis, leucopenia, pancytopenia, thrombocytopenia), and skin reactions (including erythema multiforme and toxic epidermal necrolysis). There have been occasional reports of gynaecomastia and impotence.

RANITIDINE

Cautions acute porphyria; **interactions:** Appendix 1 (histamine H₂-antagonists)

Renal impairment use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid unless essential, but not known to be harmful

Breast-feeding significant amount present in milk, but not known to be harmful

Side-effects see notes above; also *rarely* tachycardia, agitation, visual disturbances, alopecia; *very rarely* interstitial nephritis

Licensed use *oral* preparations not licensed for use in children under 3 years; *injection* not licensed for use in children under 6 months

Indication and dose

Reflux oesophagitis, benign gastric and duodenal ulceration, prophylaxis of stress ulceration, other conditions where gastric acid reduction is beneficial (see notes above and section 1.9.4)

• By mouth

Neonate 2 mg/kg 3 times daily but absorption unreliable; max. 3 mg/kg 3 times daily

Child 1–6 months 1 mg/kg 3 times daily; max. 3 mg/kg 3 times daily

Child 6 months–3 years 2–4 mg/kg twice daily

Child 3–12 years 2–4 mg/kg (max. 150 mg) twice daily; increased up to 5 mg/kg (max. 300 mg) twice daily in severe gastro-oesophageal reflux disease

Child 12–18 years 150 mg twice daily or 300 mg at night; increased if necessary, to 300 mg twice daily or 150 mg 4 times daily for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease

Note In fat malabsorption syndrome, give 1–2 hours before food to enhance effects of pancreatic enzyme replacement

• By slow intravenous injection

Neonate 0.5–1 mg/kg every 6–8 hours

Child 1 month–18 years 1 mg/kg (max. 50 mg) every 6–8 hours (may be given as an intermittent infusion at a rate of 25 mg/hour)

Zollinger–Ellison syndrome (but see notes above)

• By mouth

Child 12–18 years 150 mg 3 times daily (doses up to 6 g daily in divided doses have been used)

Administration For *slow intravenous injection* dilute to a concentration of 2.5 mg/mL with Glucose 5%, Sodium Chloride 0.9%, or Compound Sodium Lactate. Give over at least 3 minutes

¹ Ranitidine (Non-proprietary) (P_oM)

Tablets, ranitidine (as hydrochloride) 150 mg, net price 60-tab pack = £11.27; 300 mg, 30-tab pack = £1.32

Brands include *Ranitic*[®]

Effervescent tablets, ranitidine (as hydrochloride) 150 mg, net price 60-tab pack = £10.74; 300 mg, 30-tab pack = £11.25. Label: 13

Excipients may include sodium (check with supplier)

Oral solution, ranitidine (as hydrochloride) 75 mg/5 mL, 100 mL = £7.44, 300 mL = £21.43

Excipients may include alcohol (check with supplier)

1. Ranitidine can be sold to the public for children over 16 years (provided packs do not contain more than 2 weeks' supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg)

Zantac[®] (GSK) (P_oM)

Tablets, f/c, ranitidine (as hydrochloride) 150 mg, net price 60-tab pack = £1.30; 300 mg, 30-tab pack = £1.30

Effervescent tablets, pale yellow, ranitidine (as hydrochloride) 150 mg (contains 14.3 mmol Na⁺/tablet), net price 60-tab pack = £25.94; 300 mg (contains 20.8 mmol Na⁺/tablet), 30-tab pack = £25.51. Label: 13

Excipients include aspartame (section 9.4.1)

Syrup, sugar-free, ranitidine (as hydrochloride) 75 mg/5 mL. Net price 300 mL = £20.76

Excipients include alcohol 8%

Injection, ranitidine (as hydrochloride) 25 mg/mL. Net price 2-mL amp = 60p

1.3.2 Selective antimuscarinics

Classification not used in *BNF for Children*.

1.3.3 Chelates and complexes

Sucralfate is a complex of aluminium hydroxide and sulphated sucrose that appears to act by protecting the mucosa from acid-pepsin attack; it has minimal antacid properties. Sucralfate can be used to prevent stress ulceration in children receiving intensive care. It should be used with caution in this situation (**important**: reports of bezoar formation, see CSM advice below).

SUCRALFATE

Cautions administration of sucralfate and enteral feeds should be separated by 1 hour; **interactions**: Appendix 1 (sucralfate)

Renal impairment use with caution; aluminium is absorbed and may accumulate

Breast-feeding amount probably too small to be harmful

Bezoar formation Following reports of bezoar formation associated with sucralfate, the CSM has advised caution in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying

Side-effects constipation; *less frequently* diarrhoea, nausea, indigestion, flatulence, gastric discomfort, back pain, dizziness, headache, drowsiness, bezoar formation (see above), dry mouth, and rash

Licensed use not licensed for use in children under 15 years; tablets not licensed for prophylaxis of stress ulceration

Indication and dose

Prophylaxis of stress ulceration in child under intensive care

• By mouth

Child 1 month–2 years 250 mg 4–6 times daily

Child 2–12 years 500 mg 4–6 times daily

Child 12–15 years 1 g 4–6 times daily

Child 15–18 years 1 g 6 times daily; max. 8 g daily

Benign gastric and duodenal ulceration

• By mouth

Child 1 month–2 years 250 mg 4–6 times daily

Child 2–12 years 500 mg 4–6 times daily

Child 12–15 years 1 g 4–6 times daily

Child 15–18 years 2 g twice daily (on rising and at bedtime) or 1 g 4 times daily (1 hour before meals and at bedtime) taken for 4–6 weeks, or in resistant cases up to 12 weeks; max. 8 g daily

Administration for administration *by mouth*, sucralfate should be given 1 hour before meals, see also Cautions, above; *oral suspension* blocks fine-bore feeding tubes; crushed *tablets* may be dispersed in water.

Antepsin® (Chugai) (POM)

Tablets, scored, sucralfate 1 g, net price 50-tab pack = £4.81. Label: 5

Suspension, sucralfate, 1 g/5 mL, net price 250 mL (aniseed- and caramel-flavoured) = £4.81. Label: 5

1.3.4 Prostaglandin analogues

Classification not used in *BNF for Children*.

1.3.5 Proton pump inhibitors

The proton pump inhibitors **omeprazole** and **lansoprazole** inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the 'proton pump') of the gastric parietal cell. Omeprazole is currently only licensed in children for the treatment of *gastro-oesophageal reflux disease* with severe symptoms. Lansoprazole is not licensed for use in children, but may be considered when the available formulations of omeprazole are unsuitable. Proton pump inhibitors are effective short-term treatments for *gastric and duodenal ulcers*; they are also used in combination with antibacterials for the eradication of *Helicobacter pylori* (see p. 59 for specific regimens). An initial short course of a proton pump inhibitor is the treatment of choice in *gastro-oesophageal reflux disease* with severe symptoms; children with endoscopically confirmed *erosive, ulcerative, or stricturing oesophagitis* usually need to be maintained on a proton pump inhibitor.

Proton pump inhibitors are also used for the prevention and treatment of NSAID-associated ulcers (see p. 60). In children who need to continue NSAID treatment after an ulcer has healed, the dose of proton pump inhibitor should not normally be reduced because asymptomatic ulcer deterioration may occur.

Proton pump inhibitors are effective in the treatment of the *Zollinger-Ellison syndrome* (including cases resistant to other treatment). They are also used to

reduce the degradation of pancreatic enzyme supplements (section 1.9.4) in children with cystic fibrosis.

Side-effects Side-effects of the proton pump inhibitors include gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, flatulence, diarrhoea, constipation), and headache. Less frequent side-effects include dry mouth, peripheral oedema, dizziness, sleep disturbances, fatigue, paraesthesia, arthralgia, myalgia, rash, and pruritus. Other side-effects reported *rarely* or *very rarely* include taste disturbance, stomatitis, hepatitis, jaundice, hypersensitivity reactions (including anaphylaxis, bronchospasm), fever, depression, hallucinations, confusion, gynaecomastia, interstitial nephritis, hyponatraemia, blood disorders (including leucopenia, leucocytosis, pancytopenia, thrombocytopenia), visual disturbances, sweating, photosensitivity, alopecia, Stevens-Johnson syndrome, and toxic epidermal necrolysis. By decreasing gastric acidity, proton pump inhibitors may increase the risk of gastro-intestinal infections (including *Clostridium difficile* infection).

LANSOPRAZOLE

Cautions interactions: Appendix 1 (proton pump inhibitors)

Hepatic impairment may accumulate in severe impairment

Pregnancy manufacturer advises avoid

Breast-feeding present in milk in *animal* studies—manufacturer advises avoid

Side-effects see notes above; also glossitis, pancreatitis, anorexia, restlessness, tremor, impotence, petechiae, and purpura; *very rarely* colitis, raised serum cholesterol or triglycerides

Licensed use not licensed for use in children

Indication and dose

Gastro-oesophageal reflux disease, acid-related dyspepsia, treatment of duodenal and benign gastric ulcer including those complicating NSAID therapy, fat malabsorption despite pancreatic enzyme replacement therapy in cystic fibrosis

- By mouth

Child body-weight under 30 kg 0.5–1 mg/kg (max. 15 mg) once daily in the morning

Child body-weight over 30 kg 15–30 mg once daily in the morning

Administration for administration by a *nasogastric tube* or an *oral syringe*, Zoton FasTab® can be dispersed in a small amount of water

Zoton® (Wyeth) (FOM)

FasTab® (= orodispersible tablet), lansoprazole 15 mg, net price 28-tab pack = £5.97; 30 mg, 14-tab pack = £5.47, 28-tab pack = £11.00. Label: 5, 22, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling Tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water.

OMEPRAZOLE

Cautions interactions: Appendix 1 (proton pump inhibitors)

Hepatic impairment no more than 700 micrograms/kg (max. 20 mg) once daily

Pregnancy not known to be harmful

Breast-feeding present in milk but not known to be harmful

Side-effects see notes above; also agitation and impotence

Licensed use *capsules* and *tablets* not licensed for use in children except for severe ulcerating reflux oesophagitis in children over 1 year; *injection* not licensed for use in children under 12 years

Indication and dose

Gastro-oesophageal reflux disease, acid-related dyspepsia, treatment of duodenal and benign gastric ulcers including those complicating NSAID therapy, prophylaxis of acid aspiration, Zollinger-Ellison syndrome, fat malabsorption despite pancreatic enzyme replacement therapy in cystic fibrosis

- By mouth

Neonate 700 micrograms/kg once daily, increased if necessary after 7–14 days to 1.4 mg/kg; some neonates may require up to 2.8 mg/kg once daily

Child 1 month–2 years 700 micrograms/kg once daily, increased if necessary to 3 mg/kg (max. 20 mg) once daily

Child body-weight 10–20 kg 10 mg once daily increased if necessary to 20 mg once daily (in severe ulcerating reflux oesophagitis, max. 12 weeks at higher dose)

▮ OMEPRAZOLE (continued)

Child body-weight over 20 kg 20 mg once daily increased if necessary to 40 mg once daily (in severe ulcerating reflux oesophagitis, max. 12 weeks at higher dose)

- **By intravenous injection over 5 minutes or by intravenous infusion**

Child 1 month–12 years initially 500 micrograms/kg (max. 20 mg) once daily, increased to 2 mg/kg (max. 40 mg) once daily if necessary

Child 12–18 years 40 mg once daily

***Helicobacter pylori* eradication** (in combination with antibacterials see p. 59)

- **By mouth**

Child 1–12 years 1–2 mg/kg (max. 40 mg) once daily

Child 12–18 years 40 mg once daily

Administration for administration *by mouth*, swallow whole, or disperse *Losec MUPS*[®] tablets in water, or mix capsule contents or *Losec MUPS*[®] tablets with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should **not** be opened.

For administration through an *enteral feeding tube*, use *Losec MUPS*[®] or the contents of a capsule containing omeprazole dispersed in a large volume of water, or in 10 mL Sodium Bicarbonate 8.4% (1 mmol Na⁺/mL) (allow to stand for 10 minutes before administration).

For *intermittent intravenous infusion*, dilute reconstituted solution to a concentration of 400 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes

Omeprazole (Non-proprietary) ^(PoM)

Capsules, enclosing e/c granules, omeprazole 10 mg, net price 28-cap pack = £1.87; 20 mg, 28-cap pack = £1.75; 40 mg, 7-cap pack = £2.04, 28-cap pack = £58.00. Counselling, administration

Note Some preparations consist of an e/c tablet within a capsule; brands include *Mepradec*[®]

Dental prescribing on NHS Gastro-resistant omeprazole capsules may be prescribed

Tablets, e/c, omeprazole 10 mg, net price 28-tab pack = £6.13; 20 mg, 28-tab pack = £5.37; 40 mg, 7-tab pack = £5.08. Label: 25

Intravenous infusion, powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial = £5.21

Losec[®] (AstraZeneca) ^(PoM)

MUPS[®] (multiple-unit pellet system = dispersible tablets), f/c, omeprazole 10 mg (light pink), net price 28-tab pack = £19.34; 20 mg (pink), 28-tab pack = £29.22; 40 mg (red-brown), 7-tab pack = £14.61. Counselling, administration

Capsules, enclosing e/c granules, omeprazole 10 mg (pink), net price 28-cap pack = £19.34; 20 mg (pink/brown), 28-cap pack = £29.22; 40 mg (brown), 7-cap pack = £14.61. Counselling, administration

Intravenous infusion, powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial = £5.41

Injection, powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial (with solvent) = £5.41

1.4 Acute diarrhoea

1.4.1 Adsorbents and bulk-forming drugs

1.4.2 Antimotility drugs

The priority in acute diarrhoea, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion—this is particularly important in infants. For details of **oral rehydration preparations**, see section 9.2.1.2. Severe dehydration requires immediate admission to hospital and urgent replacement of fluid and electrolytes.

Antimotility drugs (section 1.4.2) relieve symptoms of diarrhoea. They are used in the management of uncomplicated acute diarrhoea in adults, but are **not** recommended for use in children under 12 years. Fluid and electrolyte replacement (section 9.2.1.2) are of prime importance in the treatment of acute diarrhoea.

Antispasmodics (section 1.2) are occasionally of value in treating abdominal cramp associated with diarrhoea but they should **not** be used for primary treatment. Antispasmodics and antiemetics should be **avoided** in young children with gastro-enteritis since they are rarely effective and have troublesome side-effects.

Antibacterial drugs are generally unnecessary in simple gastro-enteritis because the complaint usually resolves quickly without such treatment, and infective diarrhoeas in the UK often have a viral cause. Systemic bacterial infection does, however, need appropriate systemic treatment; for drugs used in campylobacter enteritis, shigellosis, and salmonellosis, see p. 298

Colestyramine (cholestyramine, section 1.9.2) binds unabsorbed bile salts and provides symptomatic relief of diarrhoea following ileal disease or resection.

1.4.1 Adsorbents and bulk-forming drugs

Adsorbents such as kaolin are **not** recommended for *acute diarrhoeas*. Bulk-forming drugs, such as ispaghula, methylcellulose, and sterculia (section 1.6.1) are rarely effective in controlling faecal consistency in ileostomy and colostomy.

1.4.2 Antimotility drugs

Antimotility drugs have a role in the management of uncomplicated *acute diarrhoea* in adults but not in children under 12 years; see also section 1.4. However, in the case of dehydration, fluid and electrolyte replacement (section 9.2.1.2) are of primary importance.

For comments on their role in *chronic bowel disorders* see section 1.5. Antimotility drugs are also used in children with *stoma* (section 1.8).

CODEINE PHOSPHATE

Cautions see section 4.7.2; tolerance and dependence may occur with prolonged use; **interactions:** Appendix 1 (opioid analgesics)

Contra-indications see section 4.7.2; also conditions where inhibition of peristalsis should be avoided, where abdominal distension develops, or in acute diarrhoeal conditions such as acute ulcerative colitis or antibiotic-associated colitis

Side-effects see section 4.7.2

Indication and dose

Diarrhoea (but see notes above)

- By mouth

Child 12–18 years 30 mg (range 15–60 mg) 3–4 times daily

Pain section 4.7.2

Codeine Phosphate (Non-proprietary) (POM)

Tablets, codeine phosphate 15 mg, net price 28 = £1.08; 30 mg, 28 = £1.24; 60 mg, 28 = £1.73. Label: 2

Note As for schedule 2 controlled drugs, travellers needing to take codeine phosphate tablets abroad may require a doctor's letter explaining why codeine is necessary.

CO-PHENOTROPE

A mixture of diphenoxylate hydrochloride and atropine sulphate in the mass proportions 100 parts to 1 part respectively

Cautions see under Codeine Phosphate (section 4.7.2); also young children are particularly susceptible to **overdosage** and symptoms may be delayed and observation is needed for at least 48 hours after ingestion; presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdosage (section 1.2); **interactions:** Appendix 1 (antimuscarinics, opioid analgesics)

Pregnancy may depress neonatal respiration; withdrawal effects in neonates of dependent mothers; gastric stasis and risk of inhalation pneumonia in mother during labour

Breast-feeding may be present in milk

Contra-indications see under Antimuscarinics (section 1.2) and Codeine Phosphate (section 4.7.2); also jaundice

Side-effects see under Antimuscarinics (section 1.2) and Codeine Phosphate (section 4.7.2); also fever

Licensed use not licensed for use in children under 4 years

Indication and dose

See preparations

Administration for administration *by mouth* tablets may be crushed

Co-phenotrope (Non-proprietary) (POM)

Tablets, co-phenotrope 2.5/0.025 (diphenoxylate hydrochloride 2.5 mg, atropine sulphate 25 micrograms), net price 20 = £1.79

Brands include *Lomotil*®

Dose

Control of faecal consistency after colostomy or ileostomy, adjunct to rehydration in acute diarrhoea (but see notes above)

- By mouth

Child 2–4 years half tablet 3 times daily

Child 4–9 years 1 tablet 3 times daily

Child 9–12 years 1 tablet 4 times daily

Child 12–16 years 2 tablets 3 times daily

Child 16–18 years initially 4 tablets then 2 tablets 4 times daily

Note Co-phenotrope 2.5/0.025 can be sold to the public for children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets)

LOPERAMIDE HYDROCHLORIDE

Cautions see notes above; **interactions:** Appendix 1 (loperamide)

Hepatic impairment risk of accumulation—manufacturer advises avoid

Pregnancy manufacturer advises avoid—no information available

Breast-feeding amount probably too small to be harmful

▢ LOPERAMIDE HYDROCHLORIDE (*continued*)

Contra-indications conditions where inhibition of peristalsis should be avoided, where abdominal distension develops, or in conditions such as active ulcerative colitis or antibiotic-associated colitis

Side-effects abdominal cramps, dizziness, drowsiness, and skin reactions including urticaria; paralytic ileus and abdominal bloating also reported

Licensed use *capsules* not licensed for use in children under 8 years; *syrup* not licensed for use in children under 4 years; not licensed for use in children for chronic diarrhoea

Indication and dose

Chronic diarrhoea

• By mouth

Child 1 month–1 year 100–200 micrograms/kg twice daily, 30 minutes before feeds; up to 2 mg/kg daily in divided doses occasionally required

Child 1–12 years 100–200 micrograms/kg (max. 2mg) 3–4 times daily; up to 1.25 mg/kg daily in divided doses may be required (max. 16 mg daily)

Child 12–18 years 2–4 mg 2–4 times daily (max. 16 mg daily)

Acute diarrhoea (but see notes above)

• By mouth

Child 4–8 years 1 mg 3–4 times daily for *up to 3 days only*

Child 8–12 years 2 mg 4 times daily for up to 5 days

Child 12–18 years initially 4 mg, then 2 mg after each loose stool for up to 5 days (usual dose 6–8 mg daily; max. 16 mg daily)

Loperamide (Non-proprietary) (POM)

Capsules, loperamide hydrochloride 2 mg, net price 30-cap pack = £1.07

Tablets, loperamide hydrochloride 2 mg, net price 30-tab pack = £2.15

Brands include *Norimode*®

Note Loperamide can be sold to the public, for use in children over 12 years, provided it is licensed and labelled for the treatment of acute diarrhoea

Imodium® (Janssen-Cilag) (POM)

Capsules, green/grey, loperamide hydrochloride 2 mg. Net price 30-cap pack = £1.13

Syrup, sugar-free, red, loperamide hydrochloride 1 mg/5 mL. Net price 100 mL = 9p

▀ Compound preparations

Imodium® Plus (McNeil)

Caplets (= tablets), loperamide hydrochloride 2 mg, simeticone 125 mg, net price 6-tab pack = £2.14, 12-tab pack = £3.40

Dose

Acute diarrhoea with abdominal colic

Child 12–18 years initially 1 caplet, then 1 caplet after each loose stool; max. 4 caplets daily for up to 2 days

1.5 Chronic bowel disorders

Individual symptoms of chronic bowel disorders need specific treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

Inflammatory bowel disease

Chronic inflammatory bowel diseases include *ulcerative colitis* and *Crohn's disease*. The treatment of inflammatory bowel disease in children should be initiated and supervised by a paediatric gastroenterologist. Effective management requires drug therapy, attention to nutrition, and in severe or chronic active disease, surgery.

Aminosalicylates (balsalazide, mesalazine, olsalazine, and sulfasalazine), and **corticosteroids** (hydrocortisone, budesonide, and prednisolone) form the basis of drug treatment.

Treatment of acute ulcerative colitis and Crohn's disease Acute mild to moderate disease affecting the rectum (proctitis) or the recto-sigmoid (distal colitis) is treated initially with local application of an aminosalicylate (section 1.5.1); alternatively a local corticosteroid (section 1.5.2) can be used but it is less effective. Foam preparations and suppositories are useful for children who have difficulty retaining liquid enemas.

Diffuse inflammatory bowel disease or disease that does not respond to local therapy requires oral treatment. Mild disease affecting the upper colon can be treated with an oral aminosalicylate alone; a combination of a local and an oral aminosalicylate can be used in distal colitis. Refractory or moderate inflammatory bowel disease usually requires adjunctive use of an oral corticosteroid such as **prednisolone** (section 1.5.2) for 4–8 weeks. Modified-release **budesonide** is used for children with Crohn's disease affecting the ileum and the ascending colon; it

causes fewer systemic side-effects than oral prednisolone but may be less effective.

Active Crohn's disease affecting the small intestine may be treated with **enteral nutrition** (Appendix 2) for 6–8 weeks. Alternatively, an oral corticosteroid may be used but at the expense of side-effects; the dose of the corticosteroid is reduced gradually over 8–10 weeks.

Severe inflammatory bowel disease calls for hospital admission and treatment with an intravenous corticosteroid such as **hydrocortisone** (p. 451) or **methyl-prednisolone** (p. 452); other therapy may include intravenous fluid and electrolyte replacement, and possibly parenteral nutrition. Children with ulcerative colitis that fails to respond adequately to these measures may benefit from a short course of ciclosporin. Children with unresponsive or chronically active Crohn's disease may benefit from azathioprine, mercaptopurine, or once-weekly methotrexate.

Infliximab (section 1.5.3) is used in specialist centres for children with severe active Crohn's disease whose condition has not responded adequately to treatment with a corticosteroid and a conventional immunosuppressant or who are intolerant of them. Infliximab has also been used for the treatment of severe, refractory ulcerative colitis. There are concerns about the long-term safety of infliximab in children; hepatosplenic T-cell lymphoma has been reported.

Crohn's disease of the mouth or of the perineum is more common in children than in adults and it is difficult to treat; elimination diets and the use of a topical corticosteroid (section 13.4) may be beneficial, but a systemic corticosteroid (section 6.3.2) and occasionally azathioprine may be required in severe cases.

NICE guidance

Infliximab for Crohn's disease (April 2002)

Infliximab is recommended for the treatment of severe active Crohn's disease (with or without fistulae) when treatment with immunomodulating drugs and corticosteroids has failed or is not tolerated and when surgery is inappropriate. Treatment may be repeated if the condition responded to the initial course but relapsed subsequently. Infliximab should be prescribed only by a gastroenterologist.

NICE guidance

Infliximab for subacute manifestations of ulcerative colitis (April 2008)

Infliximab is **not** recommended for the treatment of subacute manifestations of moderate to severe active ulcerative colitis that would normally be managed in an outpatient setting.

Maintenance of remission of acute ulcerative colitis and Crohn's disease

Smoking cessation (section 4.10) may reduce the risk of relapse in Crohn's disease and should be encouraged. **Aminosalicylates** are of great value in the maintenance of remission of ulcerative colitis. They are of less value in the maintenance of remission of Crohn's disease; an oral formulation of mesalazine is available for the long-term management of ileal disease. Corticosteroids are **not** suitable for maintenance treatment because of their side-effects. In resistant or frequently relapsing cases either **azathioprine** (section 1.5.3) or **mercaptopurine** (section 1.5.3) may be helpful. **Methotrexate** (section 1.5.3) is used in Crohn's disease when azathioprine or mercaptopurine are ineffective or not tolerated. **Infliximab** (p. 75) can be used for maintenance therapy in Crohn's disease or ulcerative colitis in children who respond to the initial induction course of this drug. There are concerns about the long-term safety of infliximab in children.

Fistulating Crohn's disease Treatment may not be necessary for simple, asymptomatic perianal fistulas. **Metronidazole** (section 5.1.11) or **ciprofloxacin** (section 5.1.12) may be beneficial for the treatment of fistulating Crohn's disease [both unlicensed for this indication]. Metronidazole by mouth is usually used at a dose of 7.5 mg/kg 3 times daily for 1 month but no longer than 3 months because of concerns about developing peripheral neuropathy. Ciprofloxacin by mouth is given at a dose of 5 mg/kg twice daily. Other antibacterials should be given if specifically indicated (e.g. sepsis associated with fistulas and perianal disease) and

for managing bacterial overgrowth in the small bowel. Fistulas may also require surgical exploration and local drainage.

Either **azathioprine** or **mercaptopurine** is used as a second-line treatment for fistulating Crohn's disease and continued for maintenance. **Infliximab** is used for fistulating Crohn's disease refractory to conventional treatments and it can be continued as maintenance therapy.

Adjunctive treatment of inflammatory bowel disease Due attention should be paid to diet; high-fibre or low-residue diets should be used as appropriate.

Antimotility drugs such as codeine phosphate and loperamide, and antispasmodic drugs may precipitate paralytic ileus and megacolon in active ulcerative colitis; treatment of the inflammation is more logical. Laxatives may be required in proctitis. Diarrhoea resulting from the loss of bile-salt absorption (e.g. in terminal ileal disease or bowel resection) may improve with **colestyramine** (section 1.9.2), which binds bile salts.

Irritable bowel syndrome

Irritable bowel syndrome can present with pain, constipation, or diarrhoea. Some children have important psychological aggravating factors which respond to reassurance. The **fibre** intake of children with irritable bowel syndrome should be reviewed. If an increase in dietary fibre is required, soluble fibre (e.g. oats, ispaghula husk, or sterculia) is recommended; insoluble fibre (e.g. bran) should be avoided. A **laxative** (section 1.6) can be used to treat constipation. An osmotic laxative, such as a macrogol, is preferred; lactulose may cause bloating. **Loperamide** (section 1.4.2) may relieve diarrhoea and antispasmodic drugs (section 1.2) may relieve pain. Opioids with a central action, such as codeine, are better avoided because of the risk of dependence.

Clostridium difficile infection

Antibiotic-associated colitis is caused by colonisation of the colon with *Clostridium difficile* which may follow antibacterial therapy. It is usually of acute onset, but may run a chronic course; it is a particular hazard of clindamycin but few antibacterials are free of this side-effect. Oral **metronidazole** (section 5.1.11) or oral **vancomycin** (section 5.1.7) are used as specific treatment; vancomycin may be preferred for very sick patients. Metronidazole can be given by intravenous infusion if oral treatment is inappropriate.

Malabsorption syndromes

Individual conditions need specific management and also general nutritional consideration. Coeliac disease (gluten enteropathy) usually needs a gluten-free diet (Appendix 2) and pancreatic insufficiency needs pancreatin supplements (section 1.9.4).

For further information on foods for special diets (ACBS), see Appendix 2.

1.5.1 Aminosalicylates

Sulfasalazine is a combination of 5-aminosalicylic acid ('5-ASA') and sulfapyridine; sulfapyridine acts only as a carrier to the colonic site of action but still causes side-effects. In the newer aminosalicylates, **mesalazine** (5-aminosalicylic acid), **balsalazide** (a prodrug of 5-aminosalicylic acid) and **olsalazine** (a dimer of 5-aminosalicylic acid which cleaves in the lower bowel), the sulphonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders (see recommendation below) and lupus-like syndrome also seen with sulfasalazine.

Cautions Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment (more frequently in renal impairment). Blood disorders can occur with aminosalicylates (see recommendation below).

Blood disorders

Children receiving aminosalicylates and their carers should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment. A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

Contra-indications Aminosalicylates should be avoided in salicylate hypersensitivity.

Side-effects Side-effects of the aminosalicylates include diarrhoea, nausea, vomiting, abdominal pain, exacerbation of symptoms of colitis, headache, hypersensitivity reactions (including rash and urticaria); side-effects that occur rarely include acute pancreatitis, hepatitis, myocarditis, pericarditis, lung disorders (including eosinophilia and fibrosing alveolitis), peripheral neuropathy, blood disorders (including agranulocytosis, aplastic anaemia, leucopenia, methaemoglobinemia, neutropenia, and thrombocytopenia—see also recommendation above), renal dysfunction (interstitial nephritis, nephrotic syndrome), myalgia, arthralgia, skin reactions (including lupus erythematosus-like syndrome, Stevens-Johnson syndrome), alopecia.

BALSALAZIDE SODIUM

Cautions see notes above; also history of asthma; **interactions:** Appendix 1 (aminosalicylates)

Blood disorders see recommendation above

Renal impairment manufacturer advises avoid in moderate to severe impairment

Pregnancy manufacturer advises avoid

Breast-feeding manufacturer advises avoid

Contra-indications see notes above

Hepatic impairment avoid in severe impairment

Side-effects see notes above; also cholelithiasis

Licensed use not licensed for use in children under 18 years

Indication and dose

Treatment of mild to moderate ulcerative colitis and maintenance of remission

- **By mouth**

Child 12–18 years acute attack, 2.25 g 3 times daily until remission occurs or for up to max. 12 weeks; maintenance, 1.5 g twice daily, adjusted according to response (max. 3 g twice daily)

Colazide® (Shire) (POM)

Capsules, beige, balsalazide sodium 750 mg. Net price 130-cap pack = £39.00. Label: 21, 25, counselling, blood disorder symptoms (see recommendation above)

MESALAZINE

Cautions see notes above; **interactions:** Appendix 1 (aminosalicylates)

Blood disorders see recommendation above

Renal impairment use with caution; avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m²

Pregnancy negligible quantity crosses placenta

Breast-feeding diarrhoea reported but manufacturers advise negligible amounts detected in breast milk

Contra-indications see notes above; blood clotting abnormalities

Hepatic impairment avoid in severe impairment

Side-effects see notes above

Licensed use *Asacol®* (all preparations), *Ipocol®*, *Salofalk® rectal enema*, not licensed for use in children under 18 years; *Pentasa® tablets and suppositories*, *Salofalk® tablets and suppositories*, not licensed for use in children under 15 years; *Mesren MR®*, *Pentasa® granules*, *Salofalk® rectal foam*, not licensed for use in children under 12 years; *Salofalk® granules* not licensed for use in children under 6 years; *Pentasa® retention enema*, no dose recommendation for children (age range not specified by manufacturer)

Indication and dose

Treatment of mild to moderate ulcerative colitis and maintenance of remission for dose see under preparations below

Note The delivery characteristics of oral mesalazine preparations may vary; these preparations should not be considered interchangeable

Asacol® (Procter & Gamble Pharm.) (POM)

Foam enema, mesalazine 1 g/metered application, net price 14-application canister with disposable applicators and plastic bags = £28.37. Counselling, blood disorder symptoms (see recommendation above)

Excipients include disodium edetate, hydroxybenzoates (parabens), polysorbate 20, sodium metabisulphite

Dose

Acute attack affecting the rectosigmoid region

- **By rectum**

Child 12–18 years 1 metered application (mesalazine 1 g) into the rectum daily for 4–6 weeks

Acute attack affecting the descending colon

- **By rectum**

Child 12–18 years 2 metered applications (mesalazine 2 g) once daily for 4–6 weeks

▮ MESALAZINE (continued)

Suppositories, mesalazine 250 mg, net price 20-suppos pack = £5.12; 500 mg, 10-suppos pack = £5.12. Counselling, blood disorder symptoms (see recommendation above)

Dose

Treatment and maintenance of remission of ulcerative colitis affecting the rectosigmoid region

• By rectum

Child 12–18 years 250–500 mg 3 times daily, with last dose at bedtime

Asacol® MR (Procter & Gamble Pharm.) (POM)

Tablets, red, e/c, mesalazine 400 mg, net price 90-tab pack = £31.22, 120-tab pack = £41.62. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose

Acute attack

• By mouth

Child 12–18 years 800 mg 3 times daily

Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis

• By mouth

Child 12–18 years 400–800 mg 2–3 times daily

Note Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine

Ipcol® (Sandoz) (POM)

Tablets, e/c, mesalazine 400 mg, net price 120-tab pack = £41.62. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose

Acute attack

• By mouth

Child 12–18 years 800 mg 3 times daily

Maintenance of remission

• By mouth

Child 12–18 years 400–800 mg 3 times daily

Mesren MR® (IVAX) (POM)

Tablets, red-brown, e/c, mesalazine 400 mg, net price 90-tab pack = £20.29, 120-tab pack = £27.05. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose

Acute attack

• By mouth

Child 12–18 years 800 mg 3 times daily

Maintenance of remission

• By mouth

Child 12–18 years 400–800 mg 3 times daily

Pentasa® (Ferring) (POM)

Tablets, m/r, scored, mesalazine 500 mg (grey), net price 100-tab pack = £25.48. Counselling, administration (see dose), blood disorder symptoms (see recommendation above)

Dose

Acute attack

• By mouth

Child 5–15 years 15–20 mg/kg (max. 1 g) 3 times daily

Child 15–18 years 1–2 g twice daily; total daily dose may alternatively be given in 3 divided doses

Maintenance of remission

• By mouth

Child 5–15 years 10 mg/kg (max. 500 mg) 2–3 times daily

Child 15–18 years 500 mg 3 times daily; total daily dose may alternatively be given in 2 divided doses

Administration tablets may be halved, quartered, or dispersed in water, but should not be chewed

Granules, m/r, pale brown, mesalazine 1 g/sachet, net price 50-sachet pack = £30.02; 2 g/sachet, 60-sachet pack = £72.05. Counselling, administration (see dose), blood disorder symptoms (see recommendation above)

Dose

Acute attack

• By mouth

Child 5–12 years 15–20 mg/kg (max. 1 g) 3 times daily

Child 12–18 years 1–2 g twice daily; total daily dose may alternatively be given in 3–4 divided doses

Maintenance of remission

• By mouth

Child 5–12 years 10 mg/kg (max. 500 mg) 2–3 times daily

Child 12–18 years 2 g once daily

Administration contents of one sachet should be weighed and divided immediately before use; discard any remaining granules. Granules should be placed on tongue and washed down with water or orange juice without chewing

Retention enema, mesalazine 1 g in 100-mL pack. Net price 7 enemas = £18.09. Counselling, blood disorder symptoms (see recommendation above)

Dose

Acute attack affecting the rectosigmoid region

• By rectum

Child 12–18 years 1 g at bedtime

Suppositories, mesalazine 1 g. Net price 28-suppos pack = £41.55. Counselling, blood disorder symptoms (see recommendation above)

Dose

Acute attack, ulcerative proctitis

• By rectum

Child 12–18 years 1 g daily for 2–4 weeks

Maintenance, ulcerative proctitis

• By rectum

Child 12–18 years 1 g daily

Salofalk® (Dr Falk) (POM)

Tablets, e/c, yellow, mesalazine 250 mg. Net price 100-tab pack = £17.40. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose

Acute attack

• By mouth

Child 12–18 years 500 mg 3 times daily

Maintenance of remission

• By mouth

Child 12–18 years 250–500 mg 2–3 times daily

□ MESALAZINE (continued)

Granules, m/r, grey, e/c, vanilla-flavoured, mesalazine 500 mg/sachet, net price 100-sachet pack = £29.30; 1 g/sachet, 50-sachet pack = £29.30; 1.5 g/sachet, 60-sachet pack = £49.80. Counselling, administration (see dose), blood disorder symptoms (see recommendation above)

Excipients include aspartame (section 9.4.1)

Dose

Acute attack

• By mouth

Child 6–15 years and body-weight under 40 kg 10–15 mg/kg 3 times daily

Child 6–15 years and body-weight over 40 kg 1.5–3 g once daily (preferably in the morning) or 0.5–1 g 3 times daily

Child 15–18 years 1.5–3 g once daily (preferably in the morning) or 0.5–1 g 3 times daily

Maintenance of remission

• By mouth

Child 6–15 years and body-weight under 40 kg 7.5–15 mg/kg twice daily or 250 mg 3 times daily

Child 6–15 years and body-weight over 40 kg 500 mg 3 times daily

Child 15–18 years 500 mg 3 times daily

Administration Granules should be placed on tongue and washed down with water without chewing

Note Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine

Suppositories, mesalazine 500 mg. Net price 30-suppos pack = £15.90. Counselling, blood disorder symptoms (see recommendation above)

Dose

Acute attack

• By rectum

Child 12–18 years 0.5–1 g 2–3 times daily adjusted according to response

Enema, mesalazine 2 g in 59-mL pack. Net price 7 enemas = £31.20. Counselling, blood disorder symptoms (see recommendation above)

Dose

Acute attack or maintenance

• By rectum

Child 12–18 years 2 g once daily at bedtime

Rectal foam, mesalazine 1 g/metered application, net price 14-application canister with disposable applicators and plastic bags = £31.10. Counselling, blood disorder symptoms (see recommendation above)

Excipients include cetostearyl alcohol, disodium edetate, polysorbate 60, propylene glycol, sodium metabisulphite

Dose

Mild ulcerative colitis affecting sigmoid colon and rectum

• By rectum

Child 12–18 years 2 metered applications (mesalazine 2 g) into the rectum at bedtime increased if necessary to 2 metered applications (mesalazine 2 g) twice daily

OLSALAZINE SODIUM

Cautions see notes above; **interactions:** Appendix 1 (aminosalicylates)

Blood disorders see recommendation above

Renal impairment use with caution; manufacturer advises avoid in significant impairment

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding manufacturer advises avoid unless potential benefit outweighs risk—may cause diarrhoea in infant

Contra-indications see notes above

Side-effects see notes above; watery diarrhoea common; also reported, tachycardia, palpitation, pyrexia, blurred vision, and photosensitivity

Licensed use not licensed for use in children under 12 years

Indication and dose

Treatment of acute attack of mild ulcerative colitis

• By mouth

Child 2–18 years 500 mg twice daily after food increased if necessary over 1 week to max. 1 g 3 times daily

Maintenance of remission of mild ulcerative colitis

• By mouth

Child 2–18 years 250–500 mg twice daily after food

Administration Capsules can be opened and contents sprinkled on food

Dipentem® (UCB Pharma) (PAM)

Capsules, brown, olsalazine sodium 250 mg. Net price 112-cap pack = £20.57. Label: 21, counselling, blood disorder symptoms (see recommendation above)

Tablets, yellow, scored, olsalazine sodium 500 mg. Net price 60-tab pack = £22.04. Label: 21, counselling, blood disorder symptoms (see recommendation above)

SULFASALAZINE

(Sulphasalazine)

Cautions see notes above; also history of allergy; hepatic impairment; G6PD deficiency (section 9.1.5); slow acetylator status; risk of haematological and hepatic toxicity (differential white cell, red cell, and platelet counts initially and at

monthly intervals for first 3 months; liver function tests at monthly intervals for first 3 months); upper gastro-intestinal side-effects common with doses over 4 g daily; acute porphyria (section

□ SULFASALAZINE (continued)

9.8.2); **interactions:** Appendix 1 (aminosalicylates)

Blood disorders see recommendation above

Renal impairment risk of toxicity including crystalluria—ensure high fluid intake; avoid in severe impairment

Pregnancy theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother

Breast-feeding small amount in milk (1 report of bloody diarrhoea and rashes); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants

Contra-indications see notes above; also sulphamide hypersensitivity; child under 2 years of age

Side-effects see notes above; also loss of appetite; fever; blood disorders (including Heinz body anaemia, megaloblastic anaemia); hypersensitivity reactions (including exfoliative dermatitis, epidermal necrolysis, pruritus, photosensitisation, anaphylaxis, serum sickness); ocular complications (including periorbital oedema); stomatitis, parotitis; ataxia, aseptic meningitis, vertigo, tinnitus, insomnia, depression, hallucinations; kidney reactions (including proteinuria, crystalluria, haematuria); oligospermia; urine may be coloured orange; some soft contact lenses may be stained

Indication and dose

Treatment of acute attack of mild to moderate and severe ulcerative colitis, active Crohn's disease

- **By mouth**

Child 2–12 years 10–15 mg/kg (max. 1 g) 4–6 times daily until remission occurs; increased to max. 60 mg/kg daily in divided doses, if necessary

Child 12–18 years 1–2 g 4 times daily until remission occurs

Maintenance of remission of mild to moderate and severe ulcerative colitis

- **By mouth**

Child 2–12 years 5–7.5 mg/kg (max. 500 mg) 4 times daily

Child 12–18 years 500 mg 4 times daily

Treatment of mild to moderate or severe ulcerative colitis and maintenance of remission, active Crohn's disease

- **By rectum as suppositories**

Child 5–8 years 500 mg twice daily

Child 8–12 years 500 mg in the morning and 1 g at night

Child 12–18 years 0.5–1 g twice daily

Juvenile idiopathic arthritis section 10.1.3

Sulfasalazine (Non-proprietary) (POM)

Tablets, sulfasalazine 500 mg. Net price 112 = £9.21. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

Tablets, e/c, sulfasalazine 500 mg. Net price 112-tab pack = £21.52. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained
Brands include *Sulazine EC*®

Salazopyrin® (Pharmacia) (POM)

Tablets, yellow, scored, sulfasalazine 500 mg. Net price 112-tab pack = £6.97. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

EN-Tabs® (= tablets e/c), yellow, f/c, sulfasalazine 500 mg. Net price 112-tab pack = £8.43. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

Suspension, yellow, sulfasalazine 250 mg/5 mL. Net price 500 mL = £18.84. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

Suppositories, yellow, sulfasalazine 500 mg. Net price 10 = £3.30. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

1.5.2 Corticosteroids

For the role of corticosteroids in acute ulcerative colitis and Crohn's disease, see Inflammatory Bowel Disease, p. 66.

BUDESONIDE

Cautions section 6.3.2; **interactions:** Appendix 1 (corticosteroids)

Hepatic impairment plasma-budesonide concentration may increase

Contra-indications section 6.3.2

Side-effects section 6.3.2

Licensed use not licensed for use in children

Indication and dose

See preparations

Administration Capsules can be opened and the contents mixed with apple or orange juice

▢ BUDESONIDE (continued)

Budenofalk® (Dr Falk) (POM)

Capsules, pink, enclosing e/c pellets, budesonide 3 mg, net price 100-cap pack = £76.70. Label: 5, 10, steroid card, 22, 25

Dose

Mild to moderate Crohn's disease affecting ileum or ascending colon, chronic diarrhoea due to collagenous colitis

• By mouth

Child 12–18 years 3 mg 3 times daily for up to 8 weeks; reduce dose for the last 2 weeks of treatment. See also section 6.3.2

Entocort® (AstraZeneca) (POM)

CR Capsules, grey/pink, enclosing e/c, m/r granules, budesonide 3 mg, net price 100-cap pack = £99.00. Label: 5, 10, steroid card, 22, 25

Note Dispense in original container (contains desiccant)

Dose

Mild to moderate Crohn's disease affecting the ileum or ascending colon

• By mouth

Child 12–18 years 9 mg once daily in the morning before breakfast for up to 8 weeks; reduce dose for the last 2–4 weeks of treatment. See also section 6.3.2

Enema, budesonide 2 mg/100 mL when dispersible tablet reconstituted in isotonic saline vehicle, net price pack of 7 dispersible tablets and bottles of vehicle = £33.00

Dose

Ulcerative colitis involving rectal and recto-sigmoid disease

• By rectum

Child 12–18 years 1 enema at bedtime for 4 weeks

HYDROCORTISONE

Cautions section 6.3.2; systemic absorption may occur; prolonged use should be avoided

Contra-indications intestinal obstruction, bowel perforation, recent intestinal anastomoses, extensive fistulas; untreated infection

Side-effects section 6.3.2; also local irritation

Indication and dose

Inflammatory bowel disease

• **By intravenous administration**
See p. 451

• **By rectum**
See preparations

Colifoam® (Meda) (POM)

Foam in aerosol pack, hydrocortisone acetate 10%, net price 14-application cannister with applicator = £8.21

Excipients include cetyl alcohol, hydroxybenzoates (parabens), propylene glycol

Dose

Ulcerative colitis, proctitis, proctosigmoiditis

• By rectum

Child 2–18 years initially 1 metered application (125 mg hydrocortisone acetate) inserted into the rectum once or twice daily for 2–3 weeks, then once on alternate days

PREDNISOLONE

Cautions section 6.3.2; systemic absorption may occur; prolonged use should be avoided

Contra-indications section 6.3.2; intestinal obstruction, bowel perforation, recent intestinal anastomoses, extensive fistulas; untreated infection

Side-effects section 6.3.2

Licensed use *Predfoam®*, *Predsol® retention enema* not licensed for use in children (age range not specified by manufacturer)

Indication and dose

Ulcerative colitis, Crohn's disease see also under preparations, below

• By mouth

Child 2–18 years 2 mg/kg (max. 60 mg) once daily until remission occurs, followed by reducing doses

• **By rectum**
See under preparations

Other indications section 6.3.2

▢ Oral preparations

Section 6.3.2

▢ Rectal preparations

Predenema® (Forest) (POM)

Retention enema, prednisolone 20 mg (as sodium metasulphobenzoate) in 100-mL single-dose disposable pack. Net price 1 (standard tube) = 71p, 1 (long tube) = £1.21

Dose

Ulcerative colitis

• By rectum

Child 12–18 years initially 20 mg at bedtime for 2–4 weeks, continued if good response

▢ PREDNISOLONE (continued)

Predfoam® (Forest) (POM)

Foam in aerosol pack, prednisolone 20 mg (as metasulphobenzoate sodium)/metered application, net price 14-application cannister with disposable applicators = £6.32

Excipients include cetostearyl alcohol, disodium edetate, polysorbate 20, sorbic acid

Dose

Proctitis and distal ulcerative colitis

- By rectum

Child 12–18 years 1 metered application (20 mg prednisolone) inserted into the rectum once or twice daily for 2 weeks, continued for further 2 weeks if good response

Predsol® (UCB Pharma) (POM)

Suppositories, prednisolone 5 mg (as sodium phosphate). Net price 10 = £1.40

Dose

Proctitis and rectal complications of Crohn's disease

- By rectum

Child 2–18 years 5 mg inserted night and morning after a bowel movement

1.5.3 Drugs affecting the immune response

Azathioprine, mercaptopurine, or once weekly methotrexate are used to induce remission in unresponsive or chronically active Crohn's disease. Azathioprine or mercaptopurine may also be helpful for retaining remission in frequently relapsing inflammatory bowel disease; once weekly methotrexate is used in Crohn's disease when azathioprine or mercaptopurine are ineffective or not tolerated. Response to azathioprine or mercaptopurine may not become apparent for several months. Folic acid (section 9.1.2) should be given to reduce the possibility of methotrexate toxicity. Folic acid can be given at a dose of 5 mg weekly; alternative regimens may be used in some settings.

Cyclosporin (cyclosporin) is a potent immunosuppressant and is markedly nephrotoxic. In children with severe ulcerative colitis unresponsive to other treatment, cyclosporin may reduce the need for urgent colorectal surgery.

AZATHIOPRINE

Cautions see section 8.2.1; **interactions:** Appendix 1 (azathioprine)

Contra-indications see section 8.2.1

Side-effects see section 8.2.1

Licensed use not licensed for use in ulcerative colitis or Crohn's disease

Indication and dose

Severe ulcerative colitis and Crohn's disease

- By mouth

Child 2–18 years initially 2 mg/kg (if necessary up to 3 mg/kg) once daily, then reduced

according to response to lowest effective dose; total daily dose may alternatively be given in 2 divided doses

Transplantation rejection section 8.2.1

Rheumatic diseases section 10.1.3

Preparations

Section 8.2.1

CYCLOSPORIN

Cautions see section 8.2.2; **interactions:** Appendix 1 (cyclosporin)

Contra-indications see section 8.2.2

Side-effects see section 8.2.2

Licensed use not licensed for use in ulcerative colitis

Indication and dose

Refractory ulcerative colitis

- By mouth

Child 2–18 years initially 2 mg/kg twice daily, dose adjusted according to blood-cyclosporin concentration and response; max. 5 mg/kg twice daily

Important For advice on counselling and conversion between preparations, see section 8.2.2

- By intravenous infusion

Child 3–18 years initially 0.5–1 mg/kg twice daily, dose adjusted according to blood-cyclosporin concentration and response

Nephrotic syndrome section 8.2.2

Transplantation rejection and auto-immune conditions section 8.2.2

Atopic dermatitis and psoriasis section 13.5.3

Administration for *intermittent intravenous infusion*, dilute to a concentration of 0.5–2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give over 2–6 hours; not to be used with PVC equipment; observe for at least 30 minutes after starting infusion and at frequent intervals thereafter

Preparations

Section 8.2.2

MERCAPTOPURINE

Cautions see section 8.1.3; see also Azathioprine, section 8.2.1

Contra-indications see section 8.1.3

Side-effects see section 8.1.3

Licensed use not licensed for use in severe ulcerative colitis and Crohn's disease; for other indications, see section 8.1.3

Indication and dose

Severe ulcerative colitis and Crohn's disease

• By mouth

Child 2–18 years 1–1.5 mg/kg once daily (initial max. 50 mg; may be increased to 75 mg once daily)

Acute leukaemias section 8.1.3

Preparations

Section 8.1.3

METHOTREXATE

Cautions section 10.1.3

Contra-indications section 10.1.3

Side-effects section 10.1.3

Licensed use not licensed for use in children for non-malignant conditions

Indication and dose

Severe acute Crohn's disease

• By subcutaneous or intramuscular injection

Child 7–18 years 15 mg/m² (max. 25 mg) once weekly

Maintenance of remission of severe Crohn's disease

• By mouth or by subcutaneous or intramuscular injection

Child 7–18 years 15 mg/m² (max. 25 mg) once weekly; dose reduced according to response to lowest effective dose

Safe Practice Note that the above dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the child or their carer is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the child or their carer is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

Malignant disease section 8.1.3

Rheumatic disease section 10.1.3

Psoriasis section 13.5.3

Preparations

Section 10.1.3

Cytokine modulators

Infliximab is a monoclonal antibody which inhibits the pro-inflammatory cytokine, tumour necrosis factor alpha. It should be administered under specialist supervision where adequate resuscitation facilities are available and is used in the treatment of severe refractory or fistulating Crohn's disease in children. Infliximab should be used only when treatment with other immunomodulating drugs has failed or is not tolerated and for children in whom surgery is inappropriate.

INFLIXIMAB

Cautions hepatic impairment; renal impairment; monitor for infections before, during, and for 6 months after treatment (see also Tuberculosis below); heart failure (discontinue if symptoms develop or worsen; avoid in moderate or severe heart failure); demyelinating CNS disorders (risk of exacerbation); history of malignancy (consider discontinuing treatment if malignancy develops); history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis; **interactions:** Appendix 1 (infliximab)

Tuberculosis Children should be evaluated for tuberculosis before treatment. Active tuberculosis should be

treated with standard treatment (section 5.1.9) for at least 2 months before starting infliximab. Children who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In those without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. Children and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

Hypersensitivity reactions Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or

□ INFLIXIMAB (continued)

second infusion or in children who discontinue other immunosuppressants). All children should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use. Prophylactic antipyretics, antihistamines, or hydrocortisone may be administered. Readministration not recommended after infliximab-free interval of more than 16 weeks—risk of delayed hypersensitivity reactions. Children and carers should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop

Contra-indications severe infections (see also under cautions)

Pregnancy avoid; manufacturer advises adequate contraception during and for at least 6 months after last dose

Breast-feeding avoid; manufacturer advises avoid for at least 6 months after last dose

Side-effects see under Cytokine Modulators (section 10.1.3) and Cautions above; also diarrhoea, dyspepsia; flushing, chest pain; dyspnoea; dizziness, fatigue; sinusitis; rash, increased sweating, dry skin; *less commonly* constipation, gastro-oesophageal reflux, cholecystitis, palpitation, arrhythmia, hypertension, hypotension, vasospasm, cyanosis, bradycardia, syncope, oedema, thrombophlebitis, epistaxis, pleurisy, confusion, agitation, nervousness, amnesia, sleep disturbances, vaginitis, demyelinating disorders, antibody formation, pyelonephritis, myalgia, arthralgia, eye disorders, abnormal skin pigmentation, ecchymosis, cheilitis, and alopecia; *rarely* hepatitis, intestinal stenosis, intestinal perforation, gastro-intestinal haemorrhage, pancreatitis, hepatosplenic T-cell lymphoma, circulatory failure, meningitis, seizure, neuropathy, paraesthesia, and lymphoma; *very rarely* pericardial effusion, and skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis); also

reported interstitial lung disease and transverse myelitis

Licensed use not licensed for fistulating Crohn's disease in children

Indication and dose

Severe active Crohn's disease

• By intravenous infusion

Child 6–18 years initially 5 mg/kg, then 5 mg/kg 2 weeks and 6 weeks after initial dose, then 5 mg/kg every 8 weeks; interval between maintenance doses adjusted according to response; discontinue if no response within 10 weeks of initial dose

Fistulating Crohn's disease

• By intravenous infusion

Child 6–18 years initially 5 mg/kg, then 5 mg/kg 2 weeks and 6 weeks after initial dose, then if condition has responded, consult literature for guidance on further doses

Administration for *intravenous infusion* reconstitute each 100-mg vial of powder with 10 mL Water for Injections; to dissolve, gently swirl vial without shaking; allow to stand for 5 minutes; dilute required dose with Sodium Chloride 0.9% to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours; start infusion within 3 hours of reconstitution

Remicade® (Schering-Plough) ▼ (P_M)

Intravenous infusion, powder for reconstitution, infliximab, net price 100-mg vial = £419.62. Label: 10, alert card, counselling, tuberculosis and hypersensitivity reactions

1.5.4 Food allergy

Allergy with classical symptoms of vomiting, colic and diarrhoea caused by specific foods such as cow's milk should be managed by strict avoidance. The condition should be distinguished from symptoms of occasional food intolerance in children with irritable bowel syndrome. **Sodium cromoglicate** (sodium cromoglycate) may be helpful as an adjunct to dietary avoidance.

SODIUM CROMOGLICATE

(Sodium cromoglycate)

Side-effects occasional nausea, rashes, and joint pain

Indication and dose

Food allergy (in conjunction with dietary restriction)

• By mouth

Child 2–14 years 100 mg 4 times daily before meals, dose may be increased after 2–3 weeks to a max. 40 mg/kg daily and then reduced according to response

Child 14–18 years 200 mg 4 times daily before meals, dose may be increased after 2–3 weeks to max. 40 mg/kg daily and then reduced according to response

Asthma section 3.3

Allergic conjunctivitis section 11.4.2

Allergic rhinitis section 12.2.1

Administration capsules may be swallowed whole or the contents dissolved in hot water and diluted with cold water before taking

Nalcrom® (Sanofi-Aventis) (P_M)

Capsules, sodium cromoglicate 100 mg. Net price 100-cap pack = £62.17. Label: 22, counselling, administration

1.6 Laxatives

- 1.6.1 Bulk-forming laxatives
- 1.6.2 Stimulant laxatives
- 1.6.3 Faecal softeners
- 1.6.4 Osmotic laxatives
- 1.6.5 Bowel cleansing solutions
- 1.6.6 Peripheral opioid-receptor antagonists

Before prescribing laxatives it is important to be sure that the child *is* constipated and that the constipation is *not* secondary to an underlying undiagnosed complaint.

Laxatives should be prescribed by a healthcare professional experienced in the management of constipation in children. Delays of greater than 3 days between stools may increase the likelihood of pain on passing hard stools leading to anal fissure, anal spasm and eventually to a learned response to avoid defaecation.

In infants, increased intake of fluids, particularly fruit juice containing sorbitol (e.g. prune, pear, or apple), may be sufficient to soften the stool. In infants under 1 year with mild constipation, **lactulose** (section 1.6.4) can be used to soften the stool; glycerol suppositories may be used to clear faecal impaction. The infant should be referred to a hospital paediatric specialist if these measures fail.

In children over 1 year with infrequent bowel motion or hard stools, if increased fluid and fibre intake is insufficient, an osmotic laxative containing **macrogols** or **lactulose** (section 1.6.4) can be used. If there is evidence of minor faecal retention, the addition of a **stimulant laxative** (section 1.6.2) may overcome withholding but may lead to colic or, in the presence of faecal impaction in the rectum, an increase of faecal overflow.

In children with faecal impaction, an oral preparation containing **macrogols** (section 1.6.4) is used to clear faecal mass and to establish and maintain soft well-formed stools. Rectal administration of laxatives may be effective but this route is frequently distressing for the child and may lead to a persistence of withholding. If the impacted mass is not expelled following treatment with macrogols, referral to hospital may be necessary. Enemas may be administered under heavy sedation in hospital or alternatively, a **bowel cleansing solution** (section 1.6.5) may be tried. In severe cases or where the child is afraid, manual evacuation under anaesthetic may be appropriate.

Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses.

For children with chronic constipation, it may be necessary to exceed the licensed doses of some laxatives. Parents and carers of children should be advised to adjust the dose of laxative in order to establish a regular pattern of bowel movements in which stools are soft, well-formed, and passed without discomfort.

Pregnancy If dietary and lifestyle changes fail to control constipation in pregnancy, moderate doses of poorly absorbed laxatives may be used. A bulk-forming laxative should be tried first. An osmotic laxative, such as lactulose, can also be used. Bisacodyl or senna may be suitable, if a stimulant effect is necessary.

Laxatives are also of value in *drug-induced constipation* (see Prescribing in Palliative Care, p. 26), in *distal intestinal obstruction syndrome* in children with cystic fibrosis, for the expulsion of *parasites* after anthelmintic treatment, and to clear the alimentary tract before *surgery and radiological procedures* (section 1.6.5).

The laxatives that follow have been divided into 5 main groups (sections 1.6.1–1.6.5). This simple classification disguises the fact that some laxatives have a complex action.

1.6.1 Bulk-forming laxatives

Bulk-forming laxatives are of value if the diet is deficient in fibre. They relieve constipation by increasing faecal mass which stimulates peristalsis; children and their carers should be advised that the full effect may take some days to develop.

During treatment with bulk-forming laxatives, adequate fluid intake must be maintained to avoid intestinal obstruction. Proprietary preparations containing a bulking agent such as ispaghula husk are often difficult to administer to children; unprocessed wheat bran, taken with food or fruit juice, is a most effective bulk-forming preparation. Finely ground bran, though more palatable, has poorer water-retaining properties, but can be taken as bran bread or biscuits in appropriately increased quantities. Oat bran is also used.

Bulk-forming laxatives may be used in the management of children with *haemorrhoids*, *anal fissure*, and *irritable bowel syndrome*.

ISPAGHULA HUSK

Cautions adequate fluid intake should be maintained to avoid intestinal obstruction

Contra-indications difficulty in swallowing, intestinal obstruction, colonic atony, faecal impaction

Side-effects flatulence and abdominal distension (especially during the first few days of treatment), gastro-intestinal obstruction or impaction; hypersensitivity reported

Licensed use *Regulan*[®] not licensed for use in children under 6 years; *Fybogel*[®] and *Ispagel Orange*[®] not licensed for use in children under 6 years (unless on specialist practitioner's advice); *Isogel*[®] licensed for use in children (age range not specified by manufacturer)

Indication and dose

See under preparations

Counselling Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

Fibreliel[®] (Manx)

Granules, sugar- and gluten-free, ispaghula husk 3.5 g/sachet (natural or orange flavour), net price 10 sachets = £1.23, 30 sachets = £2.07. Label: 13, counselling, see above

Excipients include aspartame (section 9.4.1)

Dose**Constipation**

• By mouth

Child 12–18 years 1–6 sachets daily in water in 1–3 divided doses

Fybogel[®] (R&C)

Granules, buff, effervescent, sugar- and gluten-free, ispaghula husk 3.5 g/sachet (low Na⁺), net price 30 sachets (plain, lemon, or orange flavour) = £3.84. Label: 13, counselling, see above

Excipients include aspartame 16 mg/sachet (see section 9.4.1)

Dose**Constipation**

• By mouth

Child 2–12 years ½–1 level 5-mL spoonful in water twice daily preferably after meals

Child 12–18 years 1 sachet or 2 level 5-mL spoonfuls in water twice daily preferably after meals

Isogel[®] (Potters)

Granules, brown, sugar- and gluten-free, ispaghula husk 90%. Net price 200 g = £2.67. Label: 13, counselling, see above

Dose**Constipation**

• By mouth

Child 2–12 years 1 level 5-mL spoonful in water once or twice daily, preferably at mealtimes

Child 12–18 years 2 level 5-mL spoonfuls in water once or twice daily, preferably at mealtimes

Note May be difficult to obtain

Ispagel Orange[®] (LPC)

Granules, beige, effervescent, sugar- and gluten-free, ispaghula husk 3.5 g/sachet, net price 30 sachets = £2.10. Label: 13, counselling, see above

Excipients include aspartame (section 9.4.1)

Dose**Constipation**

• By mouth

Child 2–12 years ½–1 level 5-mL spoonful in water twice daily preferably after meals

Child 12–18 years 1 sachet (or 2 level 5-mL spoonfuls) in water 1–3 times daily preferably after meals

Regulan[®] (Procter & Gamble)

Powder, beige, sugar- and gluten-free, ispaghula husk 3.4 g/5.85-g sachet (orange or lemon/lime flavour). Net price 30 sachets = £2.54. Label: 13, counselling, see above

Excipients include aspartame (section 9.4.1)

Dose**Constipation**

• By mouth

Child 2–12 years ½–1 level 5-mL spoonful in water 1–3 times daily

Child 12–18 years 1 sachet in 150 mL water 1–3 times daily

METHYLCELLULOSE

Cautions see under Ispaghula Husk

Contra-indications see under Ispaghula Husk; also infective bowel disease

▢ METHYLCELLULOSE (continued)

Side-effects see under Ispaghula Husk

Licensed use no age limit specified by manufacturer

Indication and dose

See under preparation below

Counselling Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

Celevac[®] (Amdipharm)

Tablets, pink, scored, methylcellulose '450' 500 mg. Net price 112-tab pack = £2.69. Counselling, see above and dose

Dose

Constipation, diarrhoea (see notes above)

• By mouth

Child 7–12 years 2 tablets twice daily

Child 12–18 years 3–6 tablets twice daily.

Administration In constipation the dose should be taken with at least 300 mL liquid. In diarrhoea, ileostomy, and colostomy control, minimise liquid intake for 30 minutes before and after dose

▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

STERCULIA

Cautions see under Ispaghula Husk

Contra-indications see under Ispaghula Husk

Side-effects see under Ispaghula Husk

Indication and dose

Constipation for dose see under preparation

Counselling Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

Normacol[®] (Norgine)

Granules, coated, gluten-free, sterculia 62%. Net price 500 g = £6.18; 60 × 7-g sachets = £5.19. Label: 25, 27, counselling, see above

Dose

• By mouth

Child 6–12 years ½–1 heaped 5-mL spoonful or the contents of ½–1 sachet, washed down without chewing with plenty of liquid once or twice daily after meals

Child 12–18 years 1–2 heaped 5-mL spoonfuls or the contents of 1–2 sachets, washed down without chewing with plenty of liquid once or twice daily after meals

Administration May be mixed with soft food (e.g. yoghurt) before swallowing, followed by plenty of liquid.

Normacol Plus[®] (Norgine)

Granules, brown, coated, gluten-free, sterculia 62%, frangula (standardised) 8%. Net price 500 g = £6.60; 60 × 7 g sachets = £5.56. Label: 25, 27, Counselling, see above

Dose

• By mouth

Child 6–12 years ½–1 heaped 5-mL spoonful or the contents of ½–1 sachet, washed down without chewing with plenty of liquid, once or twice daily after meals

Child 12–18 years 1–2 heaped 5-mL spoonfuls or the contents of 1–2 sachets, washed down without chewing with plenty of liquid, once or twice daily after meals

1.6.2 Stimulant laxatives

Stimulant laxatives include **bisacodyl**, **sodium picosulphate**, and members of the **anthraquinone** group, **senna** and **dantron** (danthron). The indications for dantron are limited (see below) by its potential carcinogenicity (based on rodent carcinogenicity studies) and evidence of genotoxicity. Powerful stimulants such as **cascara** (an anthraquinone) and **castor oil** are obsolete. **Docusate sodium** probably acts both as a stimulant and as a softening agent.

Stimulant laxatives increase intestinal motility and often cause abdominal cramp; they should be avoided in intestinal obstruction. Stools should be softened by increasing dietary fibre and liquid or with an osmotic laxative (section 1.6.4) before giving a stimulant laxative. In chronic constipation, especially where withholding of stool occurs, additional doses of a stimulant laxative may be required. Long-term use of stimulant laxatives is sometimes necessary (see section 1.6), but excessive use can cause diarrhoea and related effects such as hypokalaemia.

Glycerol suppositories act as a lubricant and as a rectal stimulant by virtue of the mildly irritant action of glycerol.

BISACODYL

Cautions prolonged use (risk of electrolyte imbalance)

Pregnancy see p. 77

Contra-indications ileus, intestinal obstruction, acute abdominal conditions, acute inflammatory bowel disease, severe dehydration

Side-effects see notes above; nausea and vomiting; colitis also reported; *suppositories* local irritation

▢ BISACODYL (continued)

Indication and dose

Constipation (tablets act in 10–12 hours; suppositories act in 20–60 minutes)

• By mouth

Child 4–10 years 5 mg at night

Child 10–18 years 5–10 mg at night; increased if necessary (max. 20 mg)

• By rectum (suppository)

Child 2–10 years 5 mg in the morning

Child 10–18 years 10 mg in the morning

Bowel clearance before radiological procedures and surgery

• By mouth and by rectum

Child 4–10 years *by mouth*, 5 mg at bedtime for 2 days before procedure and, if necessary, *by*

rectum, 5 mg suppository 1 hour before procedure

Child 10–18 years *by mouth*, 10 mg at bedtime for 2 days before procedure and, if necessary, *by rectum*, 10 mg suppository 1 hour before procedure

Bisacodyl (Non-proprietary)

Tablets, e/c, bisacodyl 5 mg. Net price 20 = 65p. Label: 5, 25

Suppositories, bisacodyl 10 mg. Net price 12 = 89p

Paediatric suppositories, bisacodyl 5 mg. Net price 5 = 94p

Note The brand name *Dulcolax*® (Boehringer Ingelheim) is used for bisacodyl tablets, net price 10-tab pack = 74p; suppositories (10 mg), 10 = £1.57; paediatric suppositories (5 mg), 5 = 94p

The brand names *Dulcolax*® *Liquid* and *Dulcolax*® *Perles* are used for sodium picosulfate preparations

DANTRON

(Dantron)

Cautions avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies)—risk of irritation and excoriation; *rodent* studies indicate potential carcinogenic risk

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid—limited information available

Contra-indications see Bisacodyl above

Side-effects see notes above; also urine may be coloured red

Indication and dose

Constipation in terminally ill children for dose see under preparations

▲ With poloxamer '188' (as co-dantramer)

Note Co-dantramer suspension 5 mL = one co-dantramer capsule, but strong co-dantramer suspension 5 mL = two strong co-dantramer capsules

Co-dantramer (Non-proprietary) (POM)

Capsules, co-dantramer 25/200 (dantron 25 mg, poloxamer '188' 200 mg). Net price 60-cap pack = £12.86. Label: 14, (urine red)

Dose

• By mouth

Child 6–12 years 1 capsule at night (restricted indications, see notes above)

Child 12–18 years 1–2 capsules at night (restricted indications, see notes above)

Strong capsules, co-dantramer 37.5/500 (dantron 37.5 mg, poloxamer '188' 500 mg). Net price 60-cap pack = £15.55. Label: 14, (urine red)

Dose

• By mouth

Child 12–18 years 1–2 capsules at night (restricted indications, see notes above)

Suspension, co-dantramer 25/200 in 5 mL (dantron 25 mg, poloxamer '188' 200 mg/5 mL). Net

price 300 mL = £11.27, 1 litre = £37.57. Label: 14, (urine red)

Brands include *Codalax*® and *Danlax*®

Dose

• By mouth

Child 2–12 years 2.5–5 mL at night (restricted indications, see notes above)

Child 12–18 years 5–10 mL at night (restricted indications, see notes above)

Strong suspension, co-dantramer 75/1000 in 5 mL (dantron 75 mg, poloxamer '188' 1 g/5 mL). Net price 300 mL = £30.13. Label: 14, (urine red) Brands include *Codalax Forte*®

Dose

• By mouth

Child 12–18 years 5 mL at night (restricted indications, see notes above)

▲ With docusate sodium (as co-dantrusate)

Co-dantrusate (Non-proprietary) (POM)

Capsules, co-dantrusate 50/60 (dantron 50 mg, docusate sodium 60 mg). Net price 63-cap pack = £14.50. Label: 14, (urine red)

Brands include *Normax*®

Dose

• By mouth

Child 6–12 years 1 capsule at night (restricted indications, see notes above)

Child 12–18 years 1–3 capsules at night (restricted indications, see notes above)

Suspension, yellow, co-dantrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL). Net price 200 mL = £8.75. Label: 14, (urine red) Brands include *Normax*®

Dose

• By mouth

Child 6–12 years 5 mL at night (restricted indications, see notes above)

Child 12–18 years 5–15 mL at night (restricted indications, see notes above)

DOCUSATE SODIUM

(Dioctyl sodium sulphosuccinate)

Cautions see notes above; do not give with liquid paraffin**Pregnancy** not known to be harmful—manufacturer advises caution**Breast-feeding** present in milk following oral administration—manufacturer advises caution**Contra-indications** see notes above; also for *rectal preparations*, haemorrhoids or anal fissure**Side-effects** see notes above**Licensed use** *adult oral solution and capsules* not licensed for use in children under 12 years**Indication and dose****Constipation**

• By mouth

Child 6 months–2 years 12.5 mg 3 times daily (use paediatric oral solution)**Child 2–12 years** 12.5–25 mg 3 times daily (use paediatric oral solution)**Child 12–18 years** up to 500 mg daily in divided doses**Note** Oral preparations act within 1–2 days; response to rectal administration usually occurs within 20 minutes; recommended doses may be exceeded on specialist advice**Adjunct in abdominal radiological procedures**

• By mouth

Child 12–18 years 400 mg with barium meal**Administration** for administration *by mouth*, solution may be mixed with milk or squash**Dioctyl®** (UCB Pharma)**Capsules**, yellow/white, docusate sodium 100 mg, net price 30-cap pack = £2.40, 100-cap pack = £8.00**Docusal®** (Typharm)**Adult oral solution**, sugar-free, docusate sodium 50 mg/5 mL, net price 300 mL = £2.48**Paediatric oral solution**, sugar-free, docusate sodium 12.5 mg/5 mL, net price 300 mL = £1.63■ **Rectal preparations****Norgalax Micro-enema®** (Norgine)**Enema**, docusate sodium 120 mg in 10-g single-dose disposable packs. Net price 10-g unit = 60p**Dose**

• By rectum

Child 12–18 years 1 enema as a single dose**GLYCEROL**

(Glycerin)

Indication and dose**Constipation**

• By rectum

Child 1 month–1 year 1-g suppository as required**Child 1–12 years** 2-g suppository as required**Child 12–18 years** 4-g suppository as required**Glycerol Suppositories, BP**

(Glycerin Suppositories)

Suppositories, gelatin 140 mg, glycerol 700 mg, purified water to 1 g. Net price 12 = £1.07 (infant, 1-g mould), £1.03 (child, 2-g mould), £1.54 (adult, 4-g mould)**Administration** Moisten with water before insertion**SENNA****Cautions** see notes above**Pregnancy** see p. 77**Breast-feeding** not known to be harmful**Contra-indications** see notes above**Side-effects** see notes above**Licensed use** *syrup* not licensed for use in children under 2 years**Indication and dose****Constipation** for dose see under preparations**Note** Onset of action 8–12 hours; initial dose should be low; recommended doses may be exceeded on specialist advice**Senna** (Non-proprietary)**Tablets**, total sennosides (calculated as sennoside B) 7.5 mg. Net price 60 = £1.70
Brands include *Senokot®* **Dose**

• By mouth

Child 6–12 years 1–2 tablets at night (or in the morning if preferred)**Child 12–18 years** 2–4 tablets at night (or in the morning if preferred)

□ SENNA (continued)

Manevac® (Galen)

Granules, coated, senna fruit 12.4%, ispaghula 54.2%, net price 400 g = £7.45. Label: 25, 27, counselling, see below

Dose

- By mouth

Child 5–12 years 1 level 5-mL spoonful once daily

Child 12–18 years 1–2 level 5-mL spoonfuls after evening meal and, if necessary, before breakfast or every 6 hours in resistant cases for 1–3 days

Administration granules can be taken mixed with a cold or warm drink or be sprinkled on food

Counselling Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

Senokot® (R&C)

Tablets (MPS), see above

Syrup, sugar-free, brown, total sennosides (calculated as sennoside B) 7.5 mg/5 mL. Net price 500 mL = £2.69

Dose

- By mouth

Child 1 month–2 years 0.5 mL/kg (max. 2.5 mL) once daily

Child 2–6 years 2.5–5 mL once daily in the morning

Child 6–12 years 5–10 mL at night or in the morning

Child 12–18 years 10–20 mL once daily, usually at bedtime

SODIUM PICOSULFATE

(Sodium picosulphate)

Cautions see notes above; active inflammatory bowel disease (avoid if fulminant)

Pregnancy see p. 77

Breast-feeding not known to be present in milk but manufacturer advises avoid unless potential benefit outweighs risk

Contra-indications see notes above; severe dehydration

Side-effects see notes above

Licensed use elixir, licensed for use in children (age range not specified by manufacturer; *Perles*® not licensed for use in children under 4 years)

Indication and dose

Constipation

- By mouth

Child 1 month–4 years 250 micrograms/kg (max. 5 mg) at night

Child 4–10 years 2.5–5 mg at night

Child 10–18 years 5–10 mg at night

Note onset of action 6–12 hours; recommended doses may be exceeded on specialist advice

Bowel evacuation before abdominal radiological and endoscopic procedures on the colon, and surgery section 1.6.5

Sodium Picosulfate (Non-proprietary)

Elixir, sodium picosulfate 5 mg/5 mL, net price 100 mL = £1.85

Note The brand name *Dulcolax*® Liquid (Boehringer Ingelheim) is used for sodium picosulfate elixir 5 mg/5 mL

Dulcolax® (Boehringer Ingelheim)

Perles® (= capsules), sodium picosulfate 2.5 mg, net price 20-cap pack = £1.93, 50-cap pack = £2.73

Note The brand name *Dulcolax*® is also used for bisacodyl tablets and suppositories

■ Bowel cleansing solutions

Section 1.6.5

1.6.3 Faecal softeners

Enemas containing **arachis oil** (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement.

Bulk laxatives (section 1.6.1) and non-ionic surfactant 'wetting' agents e.g. docosate sodium (section 1.6.2) also have softening properties. Such drugs are useful for oral administration in the management of anal fissure; glycerol suppositories (section 1.6.2) are useful for rectal use.

ARACHIS OIL

Cautions intestinal obstruction; hypersensitivity to soya

Contra-indications inflammatory bowel disease, hypersensitivity to arachis oil or peanuts

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Impacted faeces

- By rectum

Child 3–7 years 45–65 mL as required

Child 7–12 years 65–100 mL as required

Child 12–18 years 100–130 mL as required

Administration warm enema in warm water before use

Arachis Oil Enema (Non-proprietary)

Enema, arachis (peanut) oil in 130-mL single-dose disposable packs. Net price 130 mL = £7.98

1.6.4 Osmotic laxatives

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with.

Lactulose is a semi-synthetic disaccharide which is not absorbed from the gastrointestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of *hepatic encephalopathy*.

Macrogols are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydrating effect sometimes seen with osmotic laxatives. Macrogols are an effective non-traumatic means of evacuation in children with faecal impaction and can be used in the long-term management of chronic constipation.

Saline purgatives such as **magnesium hydroxide** are commonly abused but are satisfactory for occasional use; adequate fluid intake should be maintained. **Magnesium salts** are useful where rapid bowel evacuation is required. **Sodium salts** should be avoided as they may give rise to sodium and water retention in susceptible individuals. **Phosphate enemas** are useful in bowel clearance before radiology, endoscopy, and surgery. Enemas containing **phosphate** or **sodium citrate**, and oral **bowel cleansing solutions** (section 1.6.5) should only be used on the advice of a specialist practitioner.

LACTULOSE

Cautions lactose intolerance; **interactions:** Appendix 1 (lactulose)

Contra-indications galactosaemia, intestinal obstruction

Side-effects flatulence, cramps, and abdominal discomfort

Licensed use not licensed for use in children for hepatic encephalopathy

Indication and dose

Constipation (may take up to 48 hours to act)

• By mouth

Child 1 month–1 year 2.5 mL twice daily, adjusted according to response

Child 1–5 years 5 mL twice daily, adjusted according to response

Child 5–10 years 10 mL twice daily, adjusted according to response

Child 10–18 years initially 15 mL twice daily, adjusted according to response

Hepatic encephalopathy

• By mouth

Child 12–18 years 30–50 mL 3 times daily; adjust dose to produce 2–3 soft stools per day

Lactulose (Non-proprietary)

Solution, lactulose 3.1–3.7 g/5 mL with other ketoses. Net price 300-mL pack = £2.51, 500-mL pack = £2.90

Brands include *Duphalac*® , *Lactugal*®, *Regulose*®

MACROGOLS

(Polyethylene glycols)

Cautions discontinue if symptoms of fluid and electrolyte disturbance; see also preparations below

Pregnancy manufacturer advises use only if essential—no information available

Breast-feeding no information available, but absorption from gastro-intestinal tract negligible

Contra-indications intestinal perforation or obstruction, paralytic ileus, severe inflammatory conditions of the intestinal tract (such as Crohn's disease, ulcerative colitis, and toxic megacolon); see also preparations below

Side-effects abdominal distension and pain, nausea

Licensed use *Movicol*® *Paediatric Plain* not licensed for use in faecal impaction in children under 5 years, or for chronic constipation in children under 2 years

Indication and dose

See under preparations below

Laxido® (Galen)

Oral powder, orange-flavoured, macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet, net price 20-sachet pack = £3.56, 30-sachet pack = £5.34. Label: 13

Note Also available in natural flavour (sugar-free)

Cautions patients with cardiovascular impairment should not take more than 2 sachets in any 1 hour

Dose

Chronic constipation

• By mouth

Child 12–18 years 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance, 1–2 sachets daily

Administration Mix contents of each sachet in half a glass (approx. 125 mL) of water

MACROGOLS (continued)

Faecal impaction

- By mouth

Child 12–18 years 8 sachets daily, usually for max. 3 days

Administration Mix contents of 8 sachets in 1 litre of water. After reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours

Movicol® (Norgine)

Oral powder, macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet, net price 20-sachet pack (lime- and lemon- flavoured) = £4.63, 30-sachet pack (lime- and lemon- or chocolate- or plain- flavoured) = £6.95, 50-sachet pack (lime- and lemon- or plain- flavoured) = £11.58. Label: 13

Note Amount of potassium chloride varies according to flavour of *Movicol*® as follows: plain-flavour = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K⁺ 5.4 mmol/litre

Cautions patients with cardiovascular impairment should not take more than 2 sachets in any 1 hour

Dose

Chronic constipation

- By mouth

Child 12–18 years 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance, 1–2 sachets daily

Administration Mix contents of each sachet in half a glass (approx. 125 mL) of water

Faecal impaction

- By mouth

Child 12–18 years 8 sachets daily, usually for max. 3 days

Administration Mix contents of 8 sachets in 1 litre of water. After reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours

Movicol®-Half (Norgine)

Oral powder, macrogol '3350' (polyethylene glycol '3350') 6.563 g, sodium bicarbonate 89.3 mg, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet, net price 20-sachet pack (lime and

lemon flavour) = £2.78, 30-sachet pack = £4.17.

Label: 13

Cautions patients with impaired cardiovascular function should not take more than 4 sachets in any 1 hour

Dose

Chronic constipation

- By mouth

Child 12–18 years 2–6 sachets daily in divided doses usually for up to 2 weeks; maintenance, 2–4 sachets daily

Administration Mix content of each sachet dissolved in quarter of a glass (approx. 60–65 mL) of water

Faecal impaction

- By mouth

Child 12–18 years 16 sachets daily, usually for max. 3 days

Administration Mix contents of 16 sachets in 1 litre of water. After reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours

Movicol® Paediatric Plain (Norgine) (POM)

Oral powder, macrogol '3350' (polyethylene glycol '3350') 6.563 g, sodium bicarbonate 89.3 mg, sodium chloride 175.4 mg, potassium chloride 25.1 mg/sachet, net price 30-sachet pack = £4.63. Label: 13

Cautions with high doses, impaired gag reflex, reflux oesophagitis, impaired consciousness

Contra-indications cardiovascular impairment, renal impairment—no information available

Dose

Chronic constipation, prevention of faecal impaction

- By mouth

Child 1–6 years 1 sachet daily; adjust dose to produce regular soft stools (max. 4 sachets daily)

Child 6–12 years 2 sachets daily; adjust dose to produce regular soft stools (max. 4 sachets daily)

Administration Mix content of each sachet in quarter of a glass (approx. 60–65 mL) of water

Faecal impaction

- By mouth

Child 1–5 years (treat until impaction resolves or for max. 7 days) 2 sachets on first day, then 4 sachets daily for 2 days, then 6 sachets daily for 2 days, then 8 sachets daily for 2 days

Child 5–12 years (treat until impaction resolves or for max. 7 days) 4 sachets on first day, then increased in steps of 2 sachets daily to max. 12 sachets daily

Administration Mix each sachet in quarter of a glass (approx. 60–65 mL) of water; total daily dose to be taken over a 12-hour period

MAGNESIUM SALTS

Cautions see also notes above; **interactions:**

Appendix 1 (antacids)

Hepatic impairment avoid in hepatic coma if risk of renal impairment

Renal impairment avoid or reduce dose; increased risk of toxicity

Contra-indications acute gastro-intestinal conditions

Side-effects colic

Indication and dose

Constipation see under preparations below

▲ Magnesium hydroxide

Magnesium Hydroxide Mixture, BP

Aqueous suspension containing about 8% hydrated magnesium oxide. Do not store in cold place

Dose

- By mouth

Child 3–12 years 5–10 mL with water at bedtime when required

Child 12–18 years 30–45 mL with water at bedtime when required

▲ Bowel cleansing solutions

Section 1.6.5

PHOSPHATES (RECTAL)

Cautions see also notes above; *with enema*, electrolyte disturbances, renal impairment, congestive heart failure, ascites, uncontrolled hypertension, maintain adequate hydration

Contra-indications acute gastro-intestinal conditions (including gastro-intestinal obstruction, inflammatory bowel disease, and conditions associated with increased colonic absorption)

Side-effects local irritation; *with enema*, electrolyte disturbances

Indication and dose

Constipation, bowel evacuation before abdominal radiological procedures, endoscopy, and surgery

For dose see preparations

Carbalax® (Forest)

Suppositories, sodium acid phosphate (anhydrous) 1.3 g, sodium bicarbonate 1.08 g, net price 12 = £2.01

Dose

- By rectum

Child 12–18 years 1 suppository, inserted 30 minutes before evacuation required; moisten with water before use

Fleet® Ready-to-use Enema (De Witt)

Enema, sodium acid phosphate 21.4 g, sodium phosphate 9.4 g/118 mL, net price 133-mL pack (delivers 118 mL dose) with standard tube = 57p

Dose

- By rectum

Child 3–7 years 40–60 mL once daily

Child 7–12 years 60–90 mL once daily

Child 12–18 years 90–118 mL once daily

Phosphates Enema BP Formula B

Enema, sodium dihydrogen phosphate dihydrate 12.8 g, disodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL. Net price 128 mL with standard tube = £2.98, with long rectal tube = £3.98

Dose

- By rectum

Child 3–7 years 45–65 mL once daily

Child 7–12 years 65–100 mL once daily

Child 12–18 years 100–128 mL once daily

SODIUM CITRATE (RECTAL)

Cautions see notes above

Contra-indications acute gastro-intestinal conditions

Indication and dose

Constipation for dose see under preparations

glycerol and sorbitol in a viscous solution in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 41p

Dose

- By rectum

Child 3–18 years 5 mL as a single dose

Micolette Micro-enema® (Pinewood)

Enema, sodium citrate 450 mg, sodium lauryl sulphoacetate 45 mg, glycerol 625 mg, together with citric acid, potassium sorbate, and sorbitol in a viscous solution, in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 31p

Dose

- By rectum

Child 3–18 years 5–10 mL as a single dose

Relaxit Micro-enema® (Crawford)

Enema, sodium citrate 450 mg, sodium lauryl sulphate 75 mg, sorbic acid 5 mg, together with glycerol and sorbitol in a viscous solution in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 32p

Dose

- By rectum

Child 1 month–18 years 5 mL as a single dose (insert only half nozzle length in child under 3 years)

Micralax Micro-enema® (UCB Pharma)

Enema, sodium citrate 450 mg, sodium alkylsulphoacetate 45 mg, sorbic acid 5 mg, together with

1.6.5 Bowel cleansing solutions

Bowel cleansing solutions are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents. They are **not** treatments for constipation.

Gastrografin® is an **amidotrizoate** radiological contrast medium with high osmolality; it is used in the treatment of meconium ileus in neonates and in the management of distal intestinal obstruction syndrome in children with cystic fibrosis.

BOWEL CLEANSING SOLUTIONS

Cautions recent gastro-intestinal surgery; heart disease; inflammatory bowel disease; reflux oesophagitis; impaired gag reflex; administer

solution via nasogastric tube in semi-conscious or unconscious patients

Renal impairment avoid *Citramag*® and *Picolax*® if estimated glomerular filtration rate less than

□ BOWEL CLEANSING SOLUTIONS (continued)

30 mL/minute/1.73 m² (risk of hypermagnesaemia); manufacturer of *Fleet Phospho-soda*® advises avoid in significant renal impairment

Pregnancy no evidence of harm in *animal* studies; manufacturer advises caution especially in first trimester

Breast-feeding not excreted in breast milk

Contra-indications gastro-intestinal obstruction, gastric retention, gastro-intestinal ulceration, perforated bowel, congestive cardiac failure; toxic colitis, toxic megacolon or ileus

Side-effects nausea, vomiting, abdominal pain (usually transient—reduced by taking more slowly), abdominal distension, anal discomfort; less frequently headache, rash, and electrolyte disturbances

Licensed use *Klean-Prep*® not licensed for use in children

Indication and dose

Clearance of bowel prior to radiological examination, colonoscopy, or surgery

For dose see under preparations

Citramag® (Sanochemia)

Oral powder, sugar-free, effervescent, magnesium carbonate 11.57 g, anhydrous citric acid 17.79 g/sachet, net price 10-sachet pack (lemon and lime flavour) = £14.90. Label: 10, patient information leaflet, 13, counselling, see below

Dose

• By mouth

Child 5–10 years on day before procedure, one-third of a sachet at 8 a.m. and one-third of a sachet between 2 and 4 p.m.

Child 10–18 years on day before procedure, ½–1 sachet at 8 a.m. and ½–1 sachet between 2 and 4 p.m.

Counselling The patient information leaflet advises that hot water (200 mL) is needed to make the solution and provides guidance on the timing and procedure for reconstitution; it also mentions need for high fluid, low residue diet beforehand (according to hospital advice), and explains that only clear fluids can be taken after *Citramag*® until procedure completed

Fleet Phospho-soda® (De Witt)

Oral solution, sugar-free, sodium dihydrogen phosphate dihydrate 24.4 g, disodium phosphate dodecahydrate 10.8 g/45 mL. Contains about 217 mmol Na⁺/45 mL. Net price 2 × 45-mL bottles = £4.79. Label: 10, patient information leaflet, counselling

Dose

• By mouth

Child 15–18 years 45 mL diluted with half a glass (120 mL) of cold water, followed by one full glass (240 mL) of cold water

Timing of doses is dependent on the time of the procedure

For morning procedure, first dose should be taken at 7 a.m. and second at 7 p.m. on day before the procedure

For afternoon procedure, first dose should be taken at 7 p.m. on day before and second dose at 7 a.m. on day of the procedure

Solid food must not be taken during dosing period; clear liquids or water should be substituted for meals

Acts within half to 6 hours of first dose

Klean-Prep® (Norgine)

Oral powder, sugar-free, macrogol '3350' (polyethylene glycol '3350') 59 g, anhydrous sodium sulphate 5.685 g, sodium bicarbonate 1.685 g, sodium chloride 1.465 g, potassium chloride 743 mg/sachet, net price 4 sachets = £8.56. Label: 10, patient information leaflet, counselling

Excipients include aspartame (section 9.4.1)

Note Allergic reactions reported. 1 sachet when reconstituted with 1 litre water provides Na⁺ 125 mmol, K⁺ 10 mmol

Dose

Clearance of bowel prior to radiological examination, colonoscopy or surgery

• By mouth

Child 12–18 years a glass (approx. 250 mL) of reconstituted solution every 10–15 minutes, or by nasogastric tube 20–30 mL/minute, until 4 litres have been consumed or watery stools are free of solid matter. The solution from all 4 sachets should be drunk within 4–6 hours (250 mL drunk rapidly every 10–15 minutes)

Alternatively total volume for administration given in 2 divided doses, first dose taken on the evening before examination and second dose on the morning of the examination

Distal intestinal obstruction syndrome

• By mouth, nasogastric or gastrostomy tube

Child 1–18 years 10 mL/kg/hour for 30 minutes, then 20 mL/kg/hour for 30 minutes, then increase to 25 mL/kg/hour if tolerated; max. 100 mL/kg (or 4 litres) over 4 hours; repeat 4-hour treatment if necessary.

Administration Each sachet should be made up to 1 litre with water; flavouring such as clear fruit cordials may be added if required; to facilitate gastric emptying domperidone (section 1.2) may be given 30 minutes before starting. After reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.

Picolax® (Ferring)

Oral powder, sugar-free, sodium picosulfate 10 mg/sachet, with magnesium citrate. Contains 87 mmol Mg²⁺ and 5 mmol K⁺/sachet. Net price 2-sachet pack = £3.53. Label: 10, patient information leaflet, 13, counselling, see below

Dose

Bowel evacuation on day before radiological procedure, endoscopy, or surgery

• By mouth

Child 1–2 years ¼ sachet before 8 a.m. then ¼ sachet 6–8 hours later

Child 2–4 years ½ sachet before 8 a.m. then ½ sachet 6–8 hours later

Child 4–9 years 1 sachet before 8 a.m. then ½ sachet 6–8 hours later

Child 9–18 years 1 sachet before 8 a.m. then 1 sachet 6–8 hours later

Note Acts within 3 hours of first dose. Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment

Counselling. One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water; children and carers should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking

AMIDOTRIZOATES

Diatrizoates

Cautions asthma or history of allergy, latent hyperthyroidism, dehydration and electrolyte disturbance (correct first); in children with oesophageal fistulae (aspiration may lead to pulmonary oedema); benign nodular goitre; enteritis; risk of anaphylactoid reactions increased by concomitant administration of beta-blockers

Pregnancy manufacturer advises caution

Contra-indications hypersensitivity to iodine, hyperthyroidism

Side-effects diarrhoea, nausea, vomiting; also reported, abdominal pain, intestinal perforation, bowel necrosis, oral mucosal blistering, hypersensitivity reactions, pyrexia, headache, dizziness, disturbances in consciousness, hyperthyroidism, electrolyte disturbances, and skin reactions (including toxic epidermal necrolysis)

Licensed use not licensed for use in distal intestinal obstruction syndrome

Indication and dose

Uncomplicated meconium ileus

- By rectum

Neonate 15–30 mL as a single dose

Distal intestinal obstruction syndrome

- By mouth or by rectum

Child 1 month–2 years 15–30 mL as a single dose

Child body-weight 15–25 kg 50 mL as a single dose

Child body-weight over 25 kg 100 mL as a single dose

Administration Intravenous prehydration is essential in neonates and infants. Fluid intake should be encouraged for 3 hours after administration. *By mouth*, for child bodyweight under 25 kg, dilute *Gastrografin*[®] with 3 times its volume of water or fruit juice; for child bodyweight over 25 kg, dilute *Gastrografin*[®] with twice its volume of water or fruit juice. *By rectum*, administration must be carried out slowly under radiological supervision to ensure required site is reached. For child under 5 years, dilute *Gastrografin*[®] with 5 times its volume of water; for child over 5 years dilute *Gastrografin*[®] with 4 times its volume of water. Administer using a large syringe and soft rubber catheter (No.8 French); the buttocks may be taped tightly together to minimise leakage, but a balloon catheter should not be used.

Radiological investigations dose to be recommended by radiologist

Gastrografin[®] (Bayer)

Solution, sodium amidotrizoate 100 mg, meglumine amidotrizoate 660 mg/mL, net price 100-mL bottle = £15.58

Excipients include disodium edetate

1.6.6 Peripheral opioid-receptor antagonists

Classification not used in *BNF for Children*.

1.7 Local preparations for anal and rectal disorders

1.7.1 Soothing anal and rectal preparations

1.7.2 Compound anal and rectal preparations with corticosteroids

1.7.3 Rectal sclerosants

1.7.4 Management of anal fissures

In children with perianal soreness or pruritus ani, good toilet hygiene is essential; the use of alcohol-free 'wet-wipes' after each bowel motion, regular bathing and the avoidance of local irritants such as bath additives is recommended. Excoriated skin is best treated with a protective barrier emollient (section 13.2.2); in children over 1 month, **hydrocortisone** ointment or cream (section 13.4) or a compound rectal preparation (section 1.7.2) may be used for a short period of time, up to a maximum of 7 days.

Pruritus ani caused by threadworm infection requires treatment with an anthelmintic (section 5.5.1). Topical application of **white soft paraffin** or other bland emollient (section 13.2.1) may reduce anal irritation caused by threadworms.

Perianal erythema caused by streptococcal infection should be treated initially with an oral antibacterial such as **phenoxymethylpenicillin** (section 5.1.1.1) or **erythromycin** (section 5.1.5), while awaiting results of culture and sensitivity testing.

Perianal candidiasis (thrush) requires treatment with a topical antifungal preparation (section 13.10.2). For treatment of vulvovaginal candidiasis, see section 7.2.2.

Proctitis associated with inflammatory bowel disease in children is treated with corticosteroids and aminosalicylates (section 1.5).

For the management of anal fissures, see section section 1.7.4.

1.7.1 Soothing anal and rectal preparations

Haemorrhoids in children are rare, but may occur in infants with portal hypertension. Soothing rectal preparations containing mild astringents such as bismuth subgallate, zinc oxide, and hammamelis may provide symptomatic relief, but proprietary preparations which also contain lubricants, vasoconstrictors, or mild antiseptics may cause further perianal irritation.

Local anaesthetics may be used to relieve pain in children with anal fissures or pruritus ani, but local anaesthetics are absorbed through the rectal mucosa and may cause sensitisation of the anal skin. Excessive use of local anaesthetics may result in systemic effects, see section 15.2. Preparations containing local anaesthetics should be used for no longer than 2–3 days.

Lidocaine (lignocaine) ointment (section 15.2) may be applied before defaecation to relieve pain associated with anal fissure, but local anaesthetics can cause stinging initially and this may aggravate the child's fear of pain.

Other local anaesthetics such as tetracaine (amethocaine), cinchocaine (dibucaine), and pramocaine (pramoxine) may be included in rectal preparations, but these are more irritant than lidocaine.

Corticosteroids are often combined with local anaesthetics and soothing agents in topical preparations for haemorrhoids and proctitis. Topical preparations containing corticosteroids (section 1.7.2) should not be used long-term or if infection (such as herpes simplex) is present. For further information on the use of topical corticosteroids, see section 13.4.

1.7.2 Compound anal and rectal preparations with corticosteroids

Anugestic-HC® (Pfizer) (POM)

Cream, benzyl benzoate 1.2%, bismuth oxide 0.875%, hydrocortisone acetate 0.5%, Peru balsam 1.85%, pramocaine hydrochloride 1%, zinc oxide 12.35%. Net price 30 g (with rectal nozzle) = £3.71

Dose

Haemorrhoids, pruritus ani

- By rectum

Child 12–18 years apply night and morning and after a bowel movement; do not use for longer than 7 days

Suppositories, buff, benzyl benzoate 33 mg, bismuth oxide 24 mg, bismuth subgallate 59 mg, hydrocortisone acetate 5 mg, Peru balsam 49 mg, pramocaine hydrochloride 27 mg, zinc oxide 296 mg, net price 12 = £2.69

Dose

Haemorrhoids, pruritus ani

- By rectum

Child 12–18 years insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days

Anusol-HC® (McNeil) (POM)

Ointment, benzyl benzoate 1.25%, bismuth oxide 0.875%, bismuth subgallate 2.25%, hydrocortisone acetate 0.25%, Peru balsam 1.875%, zinc oxide 10.75%. Net price 30 g (with rectal nozzle) = £3.50

Dose

Haemorrhoids, pruritus ani

- By rectum

Child 12–18 years apply night and morning and after a bowel movement; do not use for longer than 7 days

Suppositories, benzyl benzoate 33 mg, bismuth oxide 24 mg, bismuth subgallate 59 mg, hydro-

cortisone acetate 10 mg, Peru balsam 49 mg, zinc oxide 296 mg. Net price 12 = £2.46

Dose

Haemorrhoids, pruritus ani

- By rectum

Child 12–18 years insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days

Perinal® (Dermal)

Spray application, hydrocortisone 0.2%, lidocaine hydrochloride 1%. Net price 30-mL pack = £6.39

Dose

Haemorrhoids, pruritus ani

- By rectum

Child 2–18 years spray once over the affected area up to 3 times daily; do not use for longer than 7 days without medical advice (child under 14 years, on medical advice only)

Proctofoam HC® (Meda) (POM)

Foam in aerosol pack, hydrocortisone acetate 1%, pramocaine hydrochloride 1%. Net price 21.2-g pack (approx. 40 applications) with applicator = £5.06

Dose

Pain and irritation associated with local, non-infected anal or perianal conditions

- By rectum

Child 12–18 years 1 applicatorful (4–6 mg hydrocortisone acetate, 4–6 mg pramocaine hydrochloride) by rectum 2–3 times daily and after a bowel movement (max. 4 times daily); do not use for longer than 7 days

Proctosedyl® (Aventis Pharma) (POM)

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, hydrocortisone 0.5%. Net price 30 g = £9.40 (with cannula)

Dose**Haemorrhoids, pruritus ani**

- **By rectum**

Child 1 month–18 years apply morning and night and after a bowel movement, externally or by rectum; do not use for longer than 7 days

Suppositories, cinchocaine (dibucaine) hydrochloride 5 mg, hydrocortisone 5 mg. Net price 12 = £4.24

Dose**Haemorrhoids, pruritus ani**

- **By rectum**

Child 12–18 years insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days

Scheriproct® (Valeant) (POM)

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, prednisolone hexanoate 0.19%. Net price 30 g = £3.00

Dose**Haemorrhoids, pruritus ani**

- **By rectum**

Child 1 month–18 years apply twice daily for 5–7 days (3–4 times daily on 1st day if necessary), then once daily for a few days after symptoms have cleared

Suppositories, cinchocaine (dibucaine) hydrochloride 1 mg, prednisolone hexanoate 1.3 mg. Net price 12 = £1.41

Dose**Haemorrhoids, pruritus ani**

- **By rectum**

Child 12–18 years insert 1 suppository daily after a bowel movement, for 5–7 days (in severe cases initially 2–3 times daily)

Ultraproct® (Meadow) (POM)

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, fluocortolone caproate 0.095%, fluocortolone pivalate 0.092%, net price 30 g (with rectal nozzle) = £4.57

Dose**Haemorrhoids, pruritus ani**

Child 1 month–18 years apply twice daily for 5–7 days (3–4 times daily on 1st day if necessary), then once daily for a few days after symptoms have cleared

Suppositories, cinchocaine (dibucaine) hydrochloride 1 mg, fluocortolone caproate 630 micrograms, fluocortolone pivalate 610 micrograms, net price 12 = £2.15

Dose**Haemorrhoids, pruritus ani**

- **By rectum**

Child 12–18 years insert 1 suppository daily after a bowel movement, for 5–7 days (in severe cases initially 2–3 times daily) then 1 suppository every other day for 1 week

Uniroid-HC® (Chemidex) (POM)

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, hydrocortisone 0.5%. Net price 30 g (with applicator) = £4.23

Dose**Haemorrhoids, pruritus ani**

- **By rectum**

Child 1 month–18 years apply twice daily and after a bowel movement, externally or by rectum; do not use for longer than 7 days (child under 12 years, on medical advice only)

Suppositories, cinchocaine (dibucaine) hydrochloride 5 mg, hydrocortisone 5 mg. Net price 12 = £1.91

Dose**Haemorrhoids, pruritus ani**

- **By rectum**

Child 12–18 years insert 1 suppository twice daily and after a bowel movement; do not use for longer than 7 days

Xyloproct® (AstraZeneca) (POM)

Ointment (water-miscible), aluminium acetate 3.5%, hydrocortisone acetate 0.275%, lidocaine 5%, zinc oxide 18%, net price 20 g (with applicator) = £2.26

Dose**Haemorrhoids, pruritus ani**

- **By rectum**

Child 1 month–18 years apply several times daily; short-term use only

1.7.3 Rectal sclerosants

Classification not used in *BNF for Children*.

1.7.4 Management of anal fissures

The management of anal fissures includes stool softening (section 1.6) and the short-term use of a topical preparation containing a local anaesthetic (section 1.7.1). If these measures are inadequate, children with chronic anal fissures should be referred for specialist treatment in hospital. Topical **glyceryl trinitrate**, 0.05% or 0.1% ointment, may be used in children to relax the anal sphincter, relieve pain and aid healing of anal fissures. Excessive application of topical nitrates causes side-effects such as headache, flushing, dizziness, and postural hypotension.

Before considering surgery, **diltiazem** 2% ointment may be used in children with chronic anal fissures resistant to topical nitrates.

Ointments containing glyceryl trinitrate in a range of strengths or diltiazem 2% are available as manufactured specials (see Special-order Manufacturers, p.943).

1.8 Stoma and enteral feeding tubes

Stoma

Prescribing for children with stoma calls for special care. The following is a brief account of some of the main points to be borne in mind.

When a solid-dose formulation such as a capsule or a tablet is given the contents of the ostomy bag should be checked for any remnants; response to treatment should be carefully monitored because of the possibility of incomplete absorption. *Enteric-coated* and *modified-release* preparations are **unsuitable**, particularly in children with an ileostomy, as there may not be sufficient release of the active ingredient.

Laxatives Enemas and washouts should be used in children with stoma only under specialist supervision; they should **not** be prescribed for those with an ileostomy as they may cause rapid and severe loss of water and electrolytes.

Children with colostomy may suffer from constipation and whenever possible it should be treated by increasing fluid intake or dietary fibre. If a laxative (section 1.6) is required, it should generally be used for short periods only.

Antidiarrhoeals Loperamide, codeine phosphate, and co-phenotrope (section 1.4.2) are effective for controlling excessive stool losses. Bulk-forming drugs (section 1.6.1) may be tried but it is often difficult to adjust the dose appropriately.

Antibacterials should **not** be given for an episode of acute diarrhoea.

Antacids The tendency to diarrhoea from magnesium salts or constipation from aluminium salts may be increased in children with stoma.

Diuretics Diuretics should be used with caution in children with an ileostomy because they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a **potassium-sparing** diuretic (section 2.2.3).

Digoxin Children with stoma are particularly susceptible to hypokalaemia. This predisposes children on digoxin to digoxin toxicity; potassium supplements (section 9.2.1.1) or a potassium-sparing diuretic (section 2.2.3) may be advisable.

Analgesics Opioid analgesics (section 4.7.2) may cause troublesome constipation in children with colostomy. When a non-opioid analgesic is required **paracetamol** is usually suitable; anti-inflammatory analgesics may cause gastric irritation and bleeding.

Iron preparations Iron supplements may cause loose stools and sore skin at the stoma site. If this is troublesome and if iron is definitely indicated a parenteral iron preparation (section 9.1.1.2) should be used. Modified-release iron preparations should be **avoided**.

Care of stoma Children and carers are usually given advice about the use of *cleansing agents*, *protective creams*, *lotions*, *deodorants*, or *sealants* whilst in hospital, either by the surgeon or by a stoma-care nurse. Voluntary organisations offer help and support to patients with stoma.

Enteral feeding tubes

Care is required in choosing an appropriate formulation of a drug for administration through a nasogastric narrow-bore feeding tube or through a percutaneous endoscopic gastrostomy (PEG) or jejunostomy tube. Liquid preparations (or soluble tablets) are preferred; injection solutions may also be suitable for administration through an enteral tube.

If a solid formulation of a medicine needs to be given, it should be given as a suspension of particles fine enough to pass through the tube. It is possible to crush many immediate-release tablets but enteric-coated or modified-release preparations should **not** be crushed.

Enteral feeds may affect the absorption of drugs and it is therefore important to consider the timing of drug administration in relation to feeds. If more than one drug needs to be given, they should be given separately and the tube should be flushed with water after each drug has been given.

Clearing blockages Carbonated (sugar-free) drinks may be marginally more effective than water in unblocking feeding tubes, but mildly acidic liquids (such as pineapple juice or cola-based drinks) can coagulate protein in feeds, causing further blockage. If these measures fail to clear the enteral feeding tube, an alkaline solution containing pancreatic enzymes may be introduced into the tube (followed after at least 5 minutes by water). Specific products designed to break up blockages caused by formula feeds are also available.

1.9 Drugs affecting intestinal secretions

1.9.1 Drugs affecting biliary composition and flow

1.9.2 Bile acid sequestrants

1.9.3 Aprotinin

1.9.4 Pancreatin

1.9.1 Drugs affecting biliary composition and flow

Bile acids (**ursodeoxycholic** and **chenodeoxycholic acid**) may be used as dietary supplements in children with inborn errors of bile acid synthesis. Ursodeoxycholic acid is used to improve the flow of bile in children with cholestatic conditions such as familial intrahepatic cholestasis, biliary atresia in infants, cystic-fibrosis-related liver disease, and cholestasis caused by total parenteral nutrition or following liver transplantation. Ursodeoxycholic acid may also relieve the severe itching associated with cholestasis.

In sclerosing cholangitis, ursodeoxycholic acid is used to lower liver enzyme and serum-bilirubin concentrations.

Ursodeoxycholic acid is also used in the treatment of intrahepatic cholestasis in pregnancy.

Smith-Lemli-Opitz syndrome Chenodeoxycholic and ursodeoxycholic acid have been used with cholesterol in children with Smith-Lemli-Opitz syndrome. Chenodeoxycholic acid is also used in combination with cholic acid to treat bile acid synthesis defects but cholic acid is difficult to obtain. Ursodeoxycholic acid and cholesterol are available from 'special-order' manufacturers or specialist importing companies, see p. 943.

URSODEOXYCHOLIC ACID

Cautions interactions: Appendix 1 (ursodeoxycholic acid)

Hepatic impairment avoid in chronic liver disease (but used in primary biliary cirrhosis)

Pregnancy no evidence of harm but manufacturer advises avoid

Breast-feeding not known to be harmful but manufacturer advises avoid

Contra-indications radio-opaque stones; non-functioning gall bladder (in patients with radiolucent gallstones)

Side-effects rarely, diarrhoea

Licensed use not licensed for use in children for indications shown below

Indication and dose

Cholestasis

- By mouth

Neonate 5 mg/kg 3 times daily, adjust dose and frequency according to response, max. 10 mg/kg 3 times daily

Child 1 month–2 years 5 mg/kg 3 times daily, adjust dose and frequency according to response, max. 10 mg/kg 3 times daily

Improvement of hepatic metabolism of essential fatty acids and bile flow, in children with cystic fibrosis

- By mouth

Child 1 month–18 years 10–15 mg/kg twice daily; total daily dose may alternatively be given in 3 divided doses

Cholestasis associated with total parenteral nutrition

- By mouth

Neonate 10mg/kg 3 times daily

Child 1 month–18 years 10 mg/kg 3 times daily

□ URSODEOXYCHOLIC ACID (continued)

Sclerosing cholangitis

- By mouth

Child 1 month–18 years 5–10 mg/kg 2–3 times daily, adjusted according to response, max. 15 mg/kg 3 times daily

Ursodeoxycholic Acid (Non-proprietary) (PoM)

Tablets, ursodeoxycholic acid 150 mg, net price 60-tab pack = £18.51. Label: 21

Capsules, ursodeoxycholic acid 250 mg, net price 60-cap pack = £35.11. Label: 21

Destolit® (Norgine) (PoM)

Tablets, scored, ursodeoxycholic acid 150 mg, net price 60-tab pack = £18.39. Label: 21

Urdox® (CP) (PoM)

Tablets, f/c, ursodeoxycholic acid 300 mg, net price 60-tab pack = £26.50. Label: 21

Ursolfalk® (Dr Falk) (PoM)

Capsules, ursodeoxycholic acid 250 mg, net price 60-cap pack = £31.10, 100-cap pack = £32.85. Label: 21

Suspension, sugar-free, ursodeoxycholic acid 250 mg/5 mL, net price 250 mL = £28.50. Label: 21

Ursogal® (Galen) (PoM)

Tablets, scored, ursodeoxycholic acid 150 mg, net price 60-tab pack = £17.05. Label: 21

Capsules, ursodeoxycholic acid 250 mg, net price 60-cap pack = £30.50. Label: 21

Other preparations for bile synthesis defects

CHENOXYCHOLIC ACID

Cautions see under Ursodeoxycholic Acid

Pregnancy avoid—fetotoxicity reported in *animal* studies

Contra-indications see under Ursodeoxycholic Acid

Side-effects see under Ursodeoxycholic Acid

Licensed use not licensed

Indication and dose

Cerebrotendinous xanthomatosis

- By mouth

Neonate 5 mg/kg 3 times daily

Child 1 month–18 years 5 mg/kg 3 times daily

Defective synthesis of bile acid

- By mouth

Neonate initially 5 mg/kg 3 times daily, reduced to 2.5 mg/kg 3 times daily

Child 1 month–18 years initially 5 mg/kg 3 times daily, reduced to 2.5 mg/kg 3 times daily

Smith-Lemli-Opitz syndrome see notes above

- By mouth

Neonate 7 mg/kg once daily or in divided doses

Child 1 month–18 years 7 mg/kg once daily or in divided doses

Administration for administration *by mouth*, add the contents of a 250-mg capsule to 25 mL of sodium bicarbonate solution 8.4% (1 mmol/mL) to produce a suspension containing chenodeoxycholic acid 10 mg/mL; use immediately after preparation, discard any remaining suspension

Chenofalk (Non-proprietary) (PoM)

Capsules, chenodeoxycholic acid 250mg Available from 'special-order' manufacturers or specialist importing companies, see p. 943

CHOLESTEROL

Cautions consult product literature

Contra-indications consult product literature

Licensed use not licensed

Indication and dose

Smith-Lemli-Opitz syndrome

- By mouth

Neonate 5–10 mg/kg 3–4 times daily

Child 1 month–18 years 5–10 mg/kg 3–4 times daily (doses up to 15 mg/kg 4 times daily have been used)

Administration cholesterol powder can be mixed with a vegetable oil before administration

Cholesterol Powder (Non-proprietary)

Available from 'special-order' manufacturers or specialist importing companies, see p. 943

1.9.2 Bile acid sequestrants

Colestyramine (cholestyramine) is an anion-exchange resin that forms an insoluble complex with bile acids in the gastro-intestinal tract; it is used to relieve diarrhoea associated with surgical procedures such as ileal resection, or following radiation therapy. Colestyramine is also used in the treatment of familial hypercholesterolaemia (see section 2.12), and to relieve pruritus in children with partial biliary obstruction, (for treatment of pruritus, see section 3.4.1). Colestyramine is

not absorbed from the gastro-intestinal tract, but will interfere with the absorption of a number of drugs, so timing of administration is important.

COLESTYRAMINE

(Cholestyramine)

Cautions see section 2.12

Contra-indications see section 2.12

Side-effects see section 2.12

Licensed use not licensed for use in children under 6 years

Indication and dose

Pruritus associated with partial biliary obstruction and primary biliary cirrhosis, diarrhoea associated with Crohn's disease, ileal resection, vagotomy, diabetic vagal neuropathy, and radiation

• By mouth

Child 1 month–1 year 1 g once daily in a suitable liquid, adjusted according to response; total daily dose may alternatively be given in 2–4 divided doses (max. 9 g daily)

Child 1–6 years 2 g once daily in a suitable liquid, adjusted according to response; total daily dose may alternatively be given in 2–4 divided doses (max. 18 g daily)

Child 6–12 years 4 g once daily in a suitable liquid, adjusted according to response; total

daily dose may alternatively be given in 2–4 divided doses (max. 24 g daily)

Child 12–18 years 4–8 g once daily in a suitable liquid, adjusted according to response; total daily dose may alternatively be given in 2–4 divided doses (max. 36 g daily)

Counselling Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption

Note For treatment of diarrhoea induced by bile acid malabsorption, if no response within 3 days an alternative therapy should be initiated

Hypercholesterolaemia section 2.12

Administration The contents of one sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, or pulpy fruits with a high moisture content

Preparations

Section 2.12

1.9.3 Aprotinin

Classification not used in *BNF for Children*.

1.9.4 Pancreatin

Pancreatin containing a mixture of protease, lipase and amylase in varying proportions aids the digestion of starch, fat, and protein. Supplements of pancreatin are given by mouth to compensate for reduced or absent exocrine secretion in cystic fibrosis, and following pancreatectomy, total gastrectomy, or chronic pancreatitis.

The dose of pancreatin is adjusted according to size, number, and consistency of stools, and the nutritional status of the child; extra allowance will be needed if snacks are taken between meals. Daily dose should not exceed 10 000 lipase units per kg body-weight per day, (**important:** see CSM advice on Higher-strength preparations below).

Pancreatin preparations

Preparation	Protease units	Amylase units	Lipase units
Creon® 10 000 capsule, e/c granules	600	8000	10 000
Creon® Micro e/c granules (per 100 mg)	200	3600	5000
Nutrizym 10® capsule, e/c minitables	500	9000	10 000
Pancrex® granules (per gram)	300	4000	5000
Pancrex V® capsule, powder	430	9000	8000
Pancrex V '125'® capsule, powder	160	3300	2950
Pancrex V® e/c tablet	110	1700	1900
Pancrex V® Forte e/c tablet	330	5000	5600
Pancrex V® powder (per gram)	1400	30 000	25 000

Higher-strength pancreatin preparations *Pancrease HL®* and *Nutrizym 22®* have been associated with the development of large bowel strictures (fibrosing

colonopathy) in children with cystic fibrosis aged between 2 and 13 years. The CSM (1995) has recommended the following:

- *Pancrease HL*[®], *Nutrizym 22*[®] should not be used in children under 16 years with cystic fibrosis;
- the total dose of pancreatic enzyme supplements used in patients with cystic fibrosis should not usually exceed 10 000 units of lipase per kg body-weight daily;
- if a patient on any pancreatin preparation develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic damage.

Possible risk factors are gender (boys at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years.

Higher-strength pancreatin preparations

Preparation	Protease units	Amylase units	Lipase units
Creon [®] 25 000 capsule, e/c pellets	1000	18 000	25 000
Creon [®] 40 000 capsule, e/c granules	1600	25 000	40 000
Nutrizym 22 [®] capsule, e/c minitables	1100	19 800	22 000
Pancrease HL [®] capsule, e/c minitables	1250	22 500	25 000

Pancreatin is inactivated by gastric acid therefore pancreatin preparations are best taken with food (or immediately before or after food). In children with cystic fibrosis with persistent fat malabsorption despite optimal use of enzyme replacement, an **H₂-receptor antagonist** (section 1.3.1), or a **proton pump inhibitor** (section 1.3.5) may improve fat digestion and absorption. Enteric-coated preparations are designed to deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). If the capsules are opened the enteric-coated granules should be mixed with milk, slightly acidic soft food or liquid such as apple juice, and then swallowed immediately without chewing. Any left-over food or liquid containing pancreatin should be discarded. Since pancreatin is also inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food.

Pancreatin can irritate the perioral skin and buccal mucosa if retained in the mouth, and excessive doses can cause perianal irritation. Hypersensitivity reactions may occur particularly if the powder is handled.

PANCREATIN

Cautions see CSM advice above; hyperuricaemia and hyperuricosuria have been associated with very high doses; **interactions:** Appendix 1 (pancreatin)

Side-effects nausea, vomiting, abdominal discomfort; skin and mucosal irritation (see notes above)

Indication and dose

Pancreatic insufficiency for dose see individual preparations, below

Creon[®] 10 000 (Solvay)

Capsules, brown/clear, enclosing buff-coloured e/c granules of pancreatin (pork), providing: protease 600 units, lipase 10 000 units, amylase 8000 units. Net price 100-cap pack = £16.66. Counselling, see dose

Dose

• By mouth

Child 1 month–18 years initially 1–2 capsules with each meal either taken whole or contents mixed with fluid or soft food (then swallowed immediately without chewing), see notes above

Creon[®] Micro (Solvay)

Gastro-resistant granules, brown, pancreatin (pork), providing: protease 200 units, lipase 5000 units, amylase 3600 units per 100 mg, net price 20 g = £31.50. Counselling, see dose

Dose

• By mouth

Neonate initially 100 mg before each feed; granules can be mixed with a small amount of breast milk or formula feed and administered immediately (manufacturer recommends mixing with a small amount of apple juice before administration)

Child 1 month–18 years initially 100 mg before each feed or meal; granules can be mixed with a small amount of milk or soft food and administered immediately (manufacturer recommends mixing with acidic liquid or pureed fruit before administration); see notes above

Note 100 mg granules = one measured scoopful (scoop supplied with product). Granules should not be chewed before swallowing.

▢ PANCREATIN (continued)

Nutrizym 10[®] (Merck)

Capsules, red/yellow, enclosing e/c minitabets of pancreatin (pork) providing minimum of: protease 500 units, lipase 10 000 units, amylase 9000 units. Net price 100 = £14.47. Counselling, see dose

Dose

• By mouth

Child 1 month–18 years 1–2 capsules with meals and 1 capsule with snacks, swallowed whole or contents taken with water or mixed with soft food (then swallowed immediately without chewing, see notes above); higher doses may be required according to response

Pancrex[®] (Paines & Byrne)

Granules, pancreatin (pork), providing minimum of: protease 300 units, lipase 5000 units, amylase 4000 units/g. Net price 300 g = £20.39. Label: 25, counselling, see dose

Excipients include lactose (7 g per 10 g dose)

Dose

• By mouth

Child 2–18 years 5–10 g just before meals washed down or mixed with milk or water

Pancrex V[®] (Paines & Byrne)

Capsules, pancreatin (pork), providing minimum of: protease 430 units, lipase 8000 units, amylase 9000 units. Net price 300-cap pack = £15.80. Counselling, see dose

Dose

• By mouth

Child 1 month–1 year contents of 1–2 capsules mixed with feeds

Child 1–18 years 2–6 capsules with meals, swallowed whole or sprinkled on food

Capsules '125', pancreatin (pork), providing minimum of: protease 160 units, lipase 2950 units, amylase 3300 units. Net price 300-cap pack = £9.72. Counselling, see dose

Dose

• By mouth

Neonate contents of 1–2 capsules in each feed (or mix with feed and give by spoon)

Tablets, e/c, pancreatin (pork), providing minimum of: protease 110 units, lipase 1900 units, amylase 1700 units. Net price 300-tab pack = £4.51. Label: 5, 25, counselling, see dose

Dose

• By mouth

Child 2–18 years 5–15 tablets before meals

Tablets forte, e/c, pancreatin (pork), providing minimum of: protease 330 units, lipase 5600 units, amylase 5000 units. Net price 300-tab pack = £13.74. Label: 5, 25, counselling, see dose

Dose

• By mouth

Child 2–18 years 6–10 tablets before meals

Powder, pancreatin (pork), providing minimum of: protease 1400 units, lipase 25 000 units, amylase

30 000 units/g. Net price 300 g = £24.28. Counselling, see dose

Dose

• By mouth

Neonate 250–500 mg with each feed

Child 1 month–18 years 0.5–2 g with meals, washed down or mixed with milk or water

▣ Higher-strength preparations

See CSM warning above

Counselling It is important to ensure adequate hydration at all times in children receiving higher-strength pancreatin preparations.

Creon[®] 25 000 (Solvay) (PwM)

Capsules, orange/clear, enclosing brown-coloured e/c pellets of pancreatin (pork), providing: protease (total) 1000 units, lipase 25 000 units, amylase 18 000 units, net price 100-cap pack = £30.03. Counselling, see above and under dose

Dose

• By mouth

Child 2–18 years initially 1 capsule with meals either taken whole or contents mixed with fluid or soft food (then swallowed immediately without chewing), see notes above

Creon[®] 40 000 (Solvay) (PwM)

Capsules, brown/clear, enclosing brown-coloured e/c granules of pancreatin (pork), providing: protease (total) 1600 units, lipase 40 000 units, amylase 25 000 units, net price 100-cap pack = £60.00. Counselling, see above and under dose

Dose

• By mouth

Child 2–18 years initially 1–2 capsules with meals either taken whole or contents mixed with fluid or soft food (then swallowed immediately without chewing), see notes above

Nutrizym 22[®] (Merck) (PwM)

Capsules, red/yellow, enclosing e/c minitabets of pancreatin (pork), providing minimum of: protease 1100 units, lipase 22 000 units, amylase 19 800 units. Net price 100-cap pack = £33.33. Counselling, see above and under dose

Dose

• By mouth

Child 15–18 years 1–2 capsules with meals and 1 capsule with snacks, swallowed whole or contents taken with water or mixed with soft food (then swallowed immediately without chewing), see notes above

Pancrease HL[®] (Janssen-Cilag) (PwM)

Capsules, enclosing light brown e/c minitabets of pancreatin (pork), providing minimum of: protease 1250 units, lipase 25 000 units, amylase 22 500 units. Net price 100 = £33.65. Counselling, see above and under dose

Dose

• By mouth

Child 15–18 years 1–2 capsules during each meal and 1 capsule with snacks swallowed whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing), see notes above

This chapter also includes advice on the drug management of the following:

- arrhythmias, p. 107
- heart failure, p. 100
- hypertension, p. 119
- pulmonary hypertension, p. 123

2.1 Positive inotropic drugs

2.1.1 Cardiac glycosides

2.1.2 Phosphodiesterase inhibitors

Positive inotropic drugs increase the force of contraction of the myocardium. Drugs which produce inotropic effects include cardiac glycosides, phosphodiesterase inhibitors, and some sympathomimetics (section 2.7.1).

2.1.1 Cardiac glycosides

The cardiac glycoside digoxin increases the force of myocardial contraction and reduces conductivity within the atrioventricular (AV) node.

Digoxin is most useful in the treatment of supraventricular tachycardias, especially for controlling ventricular response in persistent atrial fibrillation (section 2.3.1). Digoxin has a limited role in children with chronic heart failure; for reference to the role of digoxin in heart failure, see section 2.2.

For the management of atrial fibrillation, the maintenance dose of digoxin is determined on the basis of the ventricular rate at rest, which should not be allowed to fall below an acceptable level for the child.

Digoxin is now rarely used for rapid control of heart rate (see section 2.3.2), even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is **not** recommended.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because the symptoms of both are similar. Also, the plasma-digoxin concentration alone cannot indicate toxicity reliably but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Renal function is very important in determining digoxin dosage.

Hypokalaemia predisposes the child to digitalis toxicity and should be avoided; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplements (or foods rich in potassium).

Toxicity can often be managed by discontinuing digoxin and correcting hypokalaemia if appropriate; serious manifestations require urgent specialist management. **Digoxin-specific antibody fragments** are available for reversal of life-threatening overdosage (see below).

DIGOXIN

Cautions sick sinus syndrome; thyroid disease; hypoxia; severe respiratory disease; avoid hypokalaemia, hypomagnesaemia, hypercalcaemia, and hypoxia (risk of digitalis toxicity); monitor serum electrolytes and renal function; avoid rapid intravenous administration (risk of hypertension and reduced coronary flow); **interactions:** Appendix 1 (cardiac glycosides)

Renal impairment reduce dose; toxicity increased by electrolyte disturbances, adjust dose according to plasma-digoxin concentration

Pregnancy may need dosage adjustment

Breast-feeding amount too small to be harmful

Contra-indications intermittent complete heart block, second degree AV block; supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome (although can be used in infancy); ventricular tachycardia or fibrillation; hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—but with caution); myocarditis; constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution)

Side-effects see notes above; also nausea, vomiting, diarrhoea; arrhythmias, conduction disturbances; dizziness; blurred or yellow vision; rash,

▢ DIGOXIN (continued)

eosinophilia; *less commonly* depression; *very rarely* anorexia, intestinal ischaemia and necrosis, psychosis, apathy, confusion, headache, fatigue, weakness, gynaecomastia on long-term use, and thrombocytopenia

Pharmacokinetics For plasma-digoxin concentration assay, blood should ideally be taken at least 6 hours after a dose; plasma-digoxin concentration should be maintained in the range 0.8–2 micrograms/litre (see also notes above)

Licensed use heart failure, supraventricular arrhythmias

Indication and dose

Supraventricular arrhythmias and chronic heart failure (see also notes above) consult product literature for details

- **By mouth**

Neonate under 1.5 kg initially 25 micrograms/kg in 3 divided doses for 24 hours then 4–6 micrograms/kg daily in 1–2 divided doses

Neonate 1.5–2.5 kg initially 30 micrograms/kg in 3 divided doses for 24 hours then 4–6 micrograms/kg daily in 1–2 divided doses

Neonate over 2.5 kg initially 45 micrograms/kg in 3 divided doses for 24 hours then 10 micrograms/kg daily in 1–2 divided doses

Child 1 month–2 years initially 45 micrograms/kg in 3 divided doses for 24 hours then 10 micrograms/kg daily in 1–2 divided doses

Child 2–5 years initially 35 micrograms/kg in 3 divided doses for 24 hours then 10 micrograms/kg daily in 1–2 divided doses

Child 5–10 years initially 25 micrograms/kg (max. 750 micrograms) in 3 divided doses for 24 hours then 6 micrograms/kg daily (max. 250 micrograms daily) in 1–2 divided doses

Child 10–18 years initially 0.75–1.5 mg in 3 divided doses for 24 hours then 62.5–250 micrograms daily in 1–2 divided doses (higher doses may be necessary)

- **By intravenous infusion (but rarely necessary)**

Neonate under 1.5 kg initially 20 micrograms/kg in 3 divided doses for 24 hours then 4–6 micrograms/kg daily in 1–2 divided doses

Neonate 1.5–2.5 kg initially 30 micrograms/kg in 3 divided doses for 24 hours then 4–6 micrograms/kg daily in 1–2 divided doses

Neonate over 2.5 kg initially 35 micrograms/kg in 3 divided doses for 24 hours then 10 micrograms/kg daily in 1–2 divided doses

Child 1 month–2 years initially 35 micrograms/kg in 3 divided doses for 24 hours then 10 micrograms/kg daily in 1–2 divided doses

Child 2–5 years initially 35 micrograms/kg in 3 divided doses for 24 hours then 10 micrograms/kg daily in 1–2 divided doses

Child 5–10 years initially 25 micrograms/kg (max. 500 micrograms) in 3 divided doses for 24 hours then 6 micrograms/kg daily (max. 250 micrograms daily) in 1–2 divided doses

Child 10–18 years initially 0.5–1 mg in 3 divided doses for 24 hours then 62.5–250 micrograms daily in 1–2 divided doses (higher doses may be necessary)

Less urgent digitalisation

- **By mouth**

Rapid digitalisation may not always be required.

Child 10–18 years 250–500 micrograms daily (higher dose may be divided) for 5–7 days followed by maintenance dose

Note The above doses may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks. When switching from intravenous to oral route may need to increase dose by 20–30% to maintain the same plasma digoxin concentration. Plasma monitoring may be required when changing formulation to take account of varying bioavailabilities. For plasma concentration monitoring, blood should ideally be taken at least 6 hours after a dose

Administration For *intravenous infusion*, dilute with sodium chloride 0.9% intravenous infusion or glucose 5% to a max. concentration of 62.5 micrograms/mL; loading doses should be given over 30–60 minutes and maintenance dose over 10–20 minutes. Protect from light. For *oral administration*, oral solution must **not** be diluted

Digoxin (Non-proprietary) (POM)

Tablets, digoxin 62.5 micrograms, net price 28 = £1.66; 125 micrograms, 28 = £1.34; 250 micrograms, 28 = £1.37

Injection, digoxin 250 micrograms/mL, net price 2-mL amp = 70p

Excipients include alcohol, propylene glycol (see excipients) Available from Antigen

Paediatric injection, digoxin 100 micrograms/mL Available from 'special-order' manufacturers or specialist importing companies, see p.943

Lanoxin® (GSK) (POM)

Tablets, digoxin 125 micrograms, net price 20 = 32p; 250 micrograms (scored), 20 = 32p

Injection, digoxin 250 micrograms/mL, net price 2-mL amp = 66p

Lanoxin-PG® (GSK) (POM)

Tablets, blue, digoxin 62.5 micrograms. Net price 20 = 32p

Elixir, yellow, digoxin 50 micrograms/mL. Do not dilute, measure with pipette. Net price 60 mL = £5.35. Counselling, use of pipette

Digoxin-specific antibody

Digoxin-specific antibody fragments are indicated for the treatment of known or strongly suspected digoxin or digitoxin overdose, in situations where mea-

tures beyond the withdrawal of the cardiac glycoside and correction of any electrolyte abnormalities are felt to be necessary (see also notes above).

Digibind® (GSK) (POM)

Injection, powder for preparation of infusion, digoxin-specific antibody fragments (F(ab)) 38 mg. Net price per vial = £93.97 (hosp. and poisons centres only)

Dose

Consult product literature or Poisons Information Centre

2.1.2 Phosphodiesterase inhibitors

Enoximone and **milrinone** are selective phosphodiesterase inhibitors which exert most of their effect on the myocardium. They possess positive inotropic and vasodilator activity and are useful in infants and children with low cardiac output especially after cardiac surgery. Phosphodiesterase inhibitors should be limited to short-term use because long-term oral administration has been associated with increased mortality in adults with congestive heart failure.

ENOXIMONE

Cautions heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction; monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count, hepatic enzymes; avoid extravasation; **interactions:** Appendix 1 (phosphodiesterase inhibitors)

Hepatic impairment dose reduction may be required

Renal impairment consider dose reduction

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises caution—no information available

Side-effects ectopic beats; less frequently ventricular tachycardia or supraventricular arrhythmias (more likely in children with pre-existing arrhythmias); hypotension; also headache, insomnia, nausea and vomiting, diarrhoea; occasionally, chills, oliguria, fever, urinary retention; upper and lower limb pain

Licensed use not licensed for use in children

Indication and dose

Congestive heart failure, low cardiac output following cardiac surgery

- By intravenous injection and continuous intravenous infusion

Neonate initial loading dose of 500 micrograms/kg by slow intravenous injection, followed by 5–20 micrograms/kg/minute by continuous intravenous infusion over 24 hours adjusted according to response; max 24 mg/kg over 24 hours

Child 1 month–18 years initial loading dose of 500 micrograms/kg by slow intravenous injection, followed by 5–20 micrograms/kg/minute by continuous intravenous infusion over 24 hours adjusted according to response; max. 24 mg/kg over 24 hours

Administration for intravenous administration dilute to concentration of 2.5mg/mL with sodium chloride 0.9% intravenous infusion or water for injections; the initial loading dose should be given by slow intravenous injection over at least 15 minutes. Use plastic apparatus—crystal formation if glass used

Perfan® (INCA-Pharm) (POM)

Injection, enoximone 5 mg/mL. For dilution before use. Net price 20-mL amp = £15.02

Excipients include alcohol, propylene glycol

MILRINONE

Cautions see under Enoximone; also correct hypokalaemia; monitor renal function; **interactions:** Appendix 1 (phosphodiesterase inhibitors)

Renal impairment reduce dose and monitor response

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises caution—no information available

Side-effects ectopic beats, ventricular tachycardia, supraventricular arrhythmias (more likely in children with pre-existing arrhythmias), hypotension; headache; less commonly ventricular fibrillation, chest pain, tremor, hypokalaemia,

thrombocytopenia; very rarely bronchospasm, anaphylaxis, and rash

Licensed use not licensed for use in children under 18 years

Indication and dose

Congestive heart failure, low cardiac output following cardiac surgery, shock

- By intravenous infusion

Neonate initially 50–75 micrograms/kg over 30–60 minutes (reduce or omit initial dose if at risk of hypotension) then 30–45 micrograms/kg/hour by continuous intravenous infusion for 2–3 days (usually for 12 hours after cardiac surgery)

▢ **MILRINONE** (*continued*)

Child 1 month–18 years initially 50–75 micrograms/kg over 30–60 minutes (reduce or omit initial dose if at risk of hypotension) then 30–45 micrograms/kg/hour by *continuous intravenous infusion* for 2–3 days (usually for 12 hours after cardiac surgery)

Administration for *intravenous infusion* dilute with glucose 5% or sodium chloride 0.9% or sodium chloride and glucose intravenous infusion to a

concentration of 200 micrograms/mL (higher concentrations of 400 micrograms/mL have been used); loading dose may be given undiluted if fluid-restricted

Primacor[®] (Sanofi-Aventis) (PmI)

Injection, milrinone (as lactate) 1 mg/mL, net price 10-mL amp = £16.61

2.2 Diuretics

Diuretics are used for a variety of conditions in children including pulmonary oedema (caused by conditions such as respiratory distress syndrome and bronchopulmonary dysplasia), congestive heart failure, and hypertension. Hypertension in children is often resistant to therapy and may require the use of several drugs in combination (see section 2.5). Maintenance of fluid and electrolyte balance can be difficult in children on diuretics, particularly neonates whose renal function may be immature.

Loop diuretics (section 2.2.2) are used for pulmonary oedema, congestive heart failure, and in renal disease.

Thiazides (section 2.2.1) are used less commonly than loop diuretics but are often used in combination with loop diuretics or spironolactone in the management of pulmonary oedema and, in lower doses, for hypertension associated with cardiac disease.

Aminophylline infusion has been used with intravenous furosemide to relieve fluid overload in critically ill children.

Heart failure Heart failure is less common in children than in adults; it can occur as a result of congenital heart disease (e.g. septal defects), dilated cardiomyopathy, myocarditis, or cardiac surgery. Drug treatment of heart failure due to left ventricular systolic dysfunction is covered below; optimal management of heart failure with preserved left ventricular function is not established.

Acute heart failure can occur after cardiac surgery or as a complication in severe acute infections with or without myocarditis. Therapy consists of volume loading, vasodilator or inotropic drugs.

Chronic heart failure is initially treated with a **loop diuretic** (section 2.2.2), usually furosemide supplemented with spironolactone, amiloride, or potassium.

If diuresis with furosemide is insufficient, the addition of metolazone or a thiazide diuretic (section 2.2.1) can be considered. With metolazone, the resulting diuresis can be profound and care is needed to avoid potentially dangerous electrolyte disturbance.

If diuretics are insufficient an ACE inhibitor, titrated to the maximum tolerated dose, can be used. **ACE inhibitors** (section 2.5.5.1) are used for the treatment of all grades of heart failure in adults and can also be useful for children with heart failure. Addition of digoxin can be considered in children who remain symptomatic despite treatment with a diuretic and an ACE inhibitor.

Some beta-blockers improve outcome in adults with heart failure, but data on beta-blockers in children are limited. **Carvedilol** (section 2.4) has vasodilatory properties and therefore (like ACE inhibitors) also lowers afterload.

In children receiving specialist cardiology care, the selective phosphodiesterase inhibitor **enoximone** is sometimes used by mouth for its inotropic and vasodilator effects. **Spironolactone** (section 2.2.3) is usually used as a potassium-sparing drug with a loop diuretic; in adults low doses of spironolactone are effective in the treatment of heart failure. Careful monitoring of serum potassium is necessary if spironolactone is used in combination with an ACE inhibitor.

Potassium loss Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is particularly dangerous in children being treated with cardiac glycosides. In hepatic failure hypokalaemia caused by diuretics can precipitate encephalopathy.

The use of potassium-sparing diuretics (section 2.2.3) avoids the need to take potassium supplements.

2.2.1 Thiazides and related diuretics

Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of *hypertension* a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. For reference to the use of thiazides in chronic heart failure see section 2.2.

Bendroflumethiazide is licensed for use in children; **chlorthiazide** is also used.

Chlortalidone (chlorthalidone), a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days in younger children.

Metolazone is particularly effective when combined with a loop diuretic (even in renal failure) and is most effective when given 30–60 minutes before furosemide; profound diuresis can occur and the child should therefore be monitored carefully.

Cautions See also section 2.2. Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus. Electrolytes should be monitored particularly with high doses, long-term use, or in renal impairment. Thiazides and related diuretics should also be used with caution in nephrotic syndrome, hyperaldosteronism, malnourishment, hepatic impairment (avoid if severe), renal impairment, pregnancy, and breast-feeding; **interactions**: Appendix 1 (diuretics).

Contra-indications Thiazides and related diuretics should be avoided in refractory hypokalaemia, hyponatraemia, and hypercalcaemia, symptomatic hyperuricaemia, and Addison's disease.

Side-effects Side-effects of thiazides and related diuretics include mild gastrointestinal disturbances, postural hypotension, altered plasma-lipid concentrations, metabolic and electrolyte disturbances including hypokalaemia (see also notes above), hyponatraemia, hypomagnesaemia, hypercalcaemia, hyperglycaemia, hypochloraemic alkalosis, and hyperuricaemia, and gout. Less common side-effects include blood disorders including agranulocytosis, leucopenia and thrombocytopenia, and impotence. Pancreatitis, intrahepatic cholestasis, cardiac arrhythmias, headache, dizziness, paraesthesia, visual disturbances, and hypersensitivity reactions (including pneumonitis, pulmonary oedema, photosensitivity, and severe skin reactions) have also been reported.

BENDROFLUMETHIAZIDE

(Bendrofluazide)

Cautions see notes above

Hepatic impairment use with caution in mild to moderate impairment; avoid in severe impairment; hypokalaemia may precipitate coma (potassium-sparing diuretics can prevent)

Renal impairment use with caution; avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—ineffective

Pregnancy not used to treat gestational hypertension; may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may be reduced; stimulation of labour, uterine inertia, and meconium staining also reported

Breast-feeding amount too small to be harmful; large doses may suppress lactation

Contra-indications see notes above

Side-effects see notes above

Indication and dose

Oedema and hypertension

• By mouth

Child 1 month–2 years 50–100 micrograms/kg daily adjusted according to response

Child 2–12 years initially 50–400 micrograms/kg daily (max. 10 mg daily) then 50–100 micrograms/kg daily adjusted according to response

Child 12–18 years initially 5–10 mg daily or on alternate days (2.5 mg in hypertension) as a single morning dose, adjusted according to response

◊ BENDROFLUMETHIAZIDE (continued)

Bendroflumethiazide (Non-proprietary) (POM)

Tablets, bendroflumethiazide 2.5 mg, net price 28 = 83p; 5 mg, 28 = 86p

Brands include *Aprinox*®, *Neo-NaClex*®

■ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

CHLOROTHIAZIDE

Cautions see notes above; also neonate (theoretical risk of kernicterus if very jaundiced)

Hepatic impairment use with caution in mild to moderate impairment; avoid in severe impairment; hypokalaemia may precipitate coma (potassium-sparing diuretics can prevent)

Renal impairment use with caution; avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73m²—ineffective

Pregnancy not used to treat gestational hypertension; may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may be reduced; stimulation of labour, uterine inertia, and meconium staining also reported

Breast-feeding amount too small to be harmful; large doses may suppress lactation

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed

Indication and dose

Heart failure, hypertension, ascites

• By mouth

Neonate 10–20 mg/kg twice daily

Child 1–6 months 10–20 mg/kg twice daily

Child 6 months–12 years 10 mg/kg twice daily (max. 1 g daily)

Child 12–18 years 0.25–1 g once daily or 125–500 mg twice daily

Chronic hypoglycaemia section 6.1.4

Diabetes insipidus section 6.5.2

■ Preparations

Chlorothiazide oral suspension 250 mg/5 mL is available from 'special-order' manufacturers or specialist importing companies, see p. 943

CHLORTALIDONE

(Chlorthalidone)

Cautions see notes above

Hepatic impairment use with caution in mild to moderate impairment; avoid in severe impairment; hypokalaemia may precipitate coma (potassium-sparing diuretics can prevent)

Renal impairment avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—ineffective

Pregnancy not used to treat gestational hypertension; may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may be reduced; stimulation of labour, uterine inertia, and meconium staining also reported

Breast-feeding amount too small to be harmful; large doses may suppress lactation

Contra-indications see notes above

Side-effects see notes above; also *rarely* jaundice

Indication and dose

Hypertension

• By mouth

Child 5–12 years 0.5–1 mg/kg in the morning every 48 hours; max. 1.7 mg/kg every 48 hours

Child 12–18 years 25 mg daily in the morning, increased to 50 mg daily if necessary (but see notes above)

Stable heart failure

• By mouth

Child 5–12 years 0.5–1 mg/kg in the morning every 48 hours; max. 1.7 mg/kg every 48 hours

Child 12–18 years 25–50 mg daily in the morning, increased if necessary to 100–200 mg daily (reduce to lowest effective dose for maintenance)

Ascites, oedema in nephrotic syndrome

• By mouth

Child 5–12 years 0.5–1 mg/kg in the morning every 48 hours; max. 1.7 mg/kg every 48 hours

Child 12–18 years up to 50 mg daily

Hygroton® (Alliance) (POM)

Tablets, yellow, scored, chlortalidone 50 mg, net price 28-tab pack = £1.64

METOLAZONE

Cautions see notes above; also acute porphyria (section 9.8.2)

Hepatic impairment use with caution in mild to moderate impairment; avoid in severe impairment; hypokalaemia may precipitate coma (potassium-sparing diuretics can prevent)

Renal impairment remains effective in moderate impairment but risk of excessive diuresis

Pregnancy not used to treat gestational hypertension; may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfu-

◁ METOLAZONE (continued)

sion may be reduced; stimulation of labour, uterine inertia, and meconium staining also reported

Breast-feeding amount too small to be harmful; large doses may suppress lactation

Contra-indications see notes above

Side-effects see notes above; also chills, chest pain

Licensed use not licensed for use in children

Indication and dose

Oedema resistant to loop diuretics; adjunct to loop diuretics to induce diuresis

- By mouth

Child 1 month–12 years 100–200 micrograms/kg once or twice daily

Child 12–18 years 5–10 mg once daily in the morning, increased to 5–10 mg twice daily in resistant oedema

Administration Tablets may be crushed and mixed with water immediately before use

Metenix 5[®] (Sanofi-Aventis) (PBM)

Tablets, blue, metolazone 5 mg, net price 100-tab pack = £18.94

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

2.2.2 Loop diuretics

Loop diuretics inhibit reabsorption of sodium, potassium, and chloride from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics. Hypokalaemia may develop, and care is needed to avoid hypotension.

Furosemide (frusemide) and **bumetanide** are similar in activity; they produce dose-related diuresis. In children with impaired renal function very large doses may occasionally be needed; in such doses both drugs can cause deafness and bumetanide can cause myalgia. Furosemide is used extensively in children. It can be used for pulmonary oedema (e.g. in respiratory distress syndrome and bronchopulmonary dysplasia), congestive heart failure, and in renal disease. Furosemide may occasionally cause ototoxicity but the risk can be reduced by giving large oral doses in 2 or more divided doses. Long-term use of furosemide in neonates can lead to nephrocalcinosis because it increases urinary calcium excretion; a thiazide diuretic may be an alternative in this case.

FUROSEMIDE

(Frusemide)

Cautions see section 2.2; also monitor electrolytes; hypotension; correct hypovolaemia before using in oliguria; comatose and precomatose states associated with liver cirrhosis; impaired micturition; gout; hepatorenal syndrome; some liquid preparations contain alcohol, caution especially in neonates; **interactions:** Appendix 1 (diuretics)

Hepatic impairment hypokalaemia may precipitate coma (use potassium-sparing diuretic to prevent this)

Renal impairment may need high doses; deafness and tinnitus may follow rapid intravenous injection

Pregnancy not to be used to treat hypertension in pregnancy

Breast-feeding amount too small to be harmful; may inhibit lactation

Contra-indications hypovolaemia, dehydration, severe hypokalaemia, severe hyponatraemia; renal failure due to nephrotoxic or hepatotoxic drugs, anuria

Side-effects mild gastro-intestinal disturbances; hypotension; hyperglycaemia (less common than with thiazides), hyperuricaemia and gout; electrolyte disturbances including hyponatraemia, hypokalaemia (see also section 2.2), increased calcium excretion (nephrocalcinosis and nephrolithiasis reported in preterm infants), and hypomagnesaemia, metabolic alkalosis;

rarely paraesthesia, blood disorders (including thrombocytopenia, leucopenia, agranulocytosis, aplastic anaemia, haemolytic anaemia), bone marrow depression (withdraw treatment), tinnitus and deafness (usually with large parenteral doses and rapid administration, in renal impairment, or in hypoproteinaemia), and hypersensitivity reactions (including rashes, photosensitivity, eosinophilia, exfoliative dermatitis, purpura, and anaphylaxis), pancreatitis, intrahepatic cholestasis

Indication and dose

Oedema

- By mouth

Neonate 0.5–2 mg/kg every 12–24 hours (every 24 hours if postmenstrual age under 31 weeks)

Child 1 month–12 years 0.5–2 mg/kg 2–3 times daily (every 24 hours if postmenstrual age under 31 weeks); higher doses may be required in resistant oedema; max. 12 mg/kg daily, not to exceed 80 mg daily

Child 12–18 years 20–40 mg daily, increased in resistant oedema to 80–120 mg daily

- By slow intravenous injection

Neonate 0.5–1 mg/kg every 12–24 hours (every 24 hours if post-menstrual age under 31 weeks)

Child 1 month–12 years 0.5–1 mg/kg (max. 4 mg/kg) repeated every 8 hours as necessary

□ FUROSEMIDE (continued)

Child 12–18 years 20–40 mg repeated every 8 hours as necessary; higher doses may be required in resistant cases

- **By continuous intravenous infusion**

Child 1 month–18 years 0.1–2 mg/kg/hour (following cardiac surgery, initially 100 micrograms/kg/hour, doubled every 2 hours until urine output exceeds 1 mL/kg/hour)

Oliguria

- **By mouth**

Child 12–18 years initially 250 mg daily; if necessary, dose increased in steps of 250 mg given every 4–6 hours; max. single dose 2 g (rarely used)

- **By intravenous infusion**

Child 1 month–12 years 2–5 mg/kg up to 4 times daily (max. 1 g daily)

Child 12–18 years initially 250 mg over 1 hour (rate not exceeding 4 mg/minute), increase to 500 mg over 2 hours if satisfactory urine output not obtained, then give a further 1 g over 4 hours if no satisfactory response within subsequent hour, if no response obtained dialysis probably required; effective dose (up to 1 g) can be repeated every 24 hours

Administration For administration *by mouth* tablets may be crushed and mixed with water or injection solution diluted and given by mouth; for *intravenous injection* give over 5–10 minutes at a usual rate of 100 micrograms/kg/minute (not exceeding 500 micrograms/kg/minute), max. 4 mg/minute; for *intravenous infusion* dilute with sodium chloride 0.9% intravenous infusion to a concentration of 1–2 mg/mL—glucose solutions unsuitable (infusion pH must be above 5.5)

Furosemide (Non-proprietary) (POM)

Tablets, furosemide 20 mg, net price 28 = 81p; 40 mg, 28-tab pack = 86p; 500 mg, 28 = £4.37

Brands include *Froop*®, *Rusyd*®

Oral solution, sugar-free, furosemide, net price 20 mg/5 mL, 150 mL = £12.68; 40 mg/5 mL, 150 mL = £16.31; 50 mg/5 mL, 150 mL = £17.68

Brands include *Frusol*® (contains alcohol 10%)

Injection, furosemide 10 mg/mL, net price 2-mL amp = 55p; 5-mL amp = 66p; 25-mL amp = £2.50

Lasix® (Sanofi-Aventis) (POM)

Injection, furosemide 10 mg/mL, net price 2-mL amp = 78p

Note Large-volume furosemide injections also available; brands include *Minijet*®

BUMETANIDE

Cautions see under Furosemide

Hepatic impairment hypokalaemia may precipitate coma (use potassium-sparing diuretic to prevent this)

Renal impairment may need high doses

Pregnancy not to be used for treating hypertension in pregnancy

Breast-feeding manufacturer advises avoid if possible—no information available

Contra-indications see under Furosemide

Side-effects see under Furosemide; also headache, dizziness, fatigue, gynaecomastia, myalgia

Licensed use not licensed for use in children under 12 years

Indication and dose

Oedema

- **By mouth**

Child 1 month–12 years 15–50 micrograms/kg 1–4 times daily (max. single dose 2 mg); do not exceed 5 mg daily

Child 12–18 years 1 mg in the morning, repeated after 6–8 hours if necessary; severe cases up to 5 mg daily

- **By intravenous injection**

Child 12–18 years 1–2 mg, repeated after 20 minutes if necessary

- **By intravenous infusion over 30–60 minutes**

Child 1 month–12 years 25–50 micrograms/kg

Child 12–18 years 1–5 mg

Administration For *intravenous infusion*, dilute with glucose 5% intravenous infusion or sodium chloride 0.9% intravenous infusion to a concentration of 24 micrograms/mL

Bumetanide (Non-proprietary) (POM)

Tablets, bumetanide 1 mg, net price 28-tab pack = £1.22; 5 mg, 28-tab pack = £2.53

Oral liquid, bumetanide 1 mg/5 mL, net price 150 mL = £128.00

Injection, bumetanide 500 micrograms/mL, net price 4-mL amp = £1.79

Burinex® (LEO) (POM)

Tablets, scored, bumetanide 1 mg, net price 28-tab pack = £1.52; 5 mg, 28-tab pack = £9.67

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

2.2.3 Potassium-sparing diuretics and aldosterone antagonists

Spironolactone is the most commonly used potassium-sparing diuretic in children; it is an aldosterone antagonist and enhances potassium retention and sodium excretion in the distal tubule. Spironolactone is combined with other diuretics to reduce urinary potassium loss. It is also used in the long-term management of Bartter's syndrome and high doses can help to control ascites

in babies with chronic neonatal hepatitis. The clinical value of spironolactone in the management of pulmonary oedema in preterm neonates with chronic lung disease is uncertain.

Potassium canrenoate, given intravenously, is an alternative aldosterone antagonist that may be useful if a potassium-sparing diuretic is required and the child is unable to take oral medication. It is metabolised to canrenone, which is also a metabolite of spironolactone.

Amiloride on its own is a weak diuretic. It causes retention of potassium and is therefore given with thiazide or loop diuretics as an alternative to giving potassium supplements (see section 2.2.4 for compound preparations with thiazides or loop diuretics).

A potassium-sparing diuretic such as spironolactone or amiloride may also be used in the management of amphotericin-induced hypokalaemia.

Potassium supplements must **not** be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a child receiving an ACE inhibitor or an angiotensin-II receptor antagonist (section 2.5.5) can also cause severe hyperkalaemia.

AMILORIDE HYDROCHLORIDE

Cautions monitor electrolytes; diabetes mellitus;
interactions: Appendix 1 (diuretics)

Renal impairment monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment); manufacturers advise avoid in severe impairment

Pregnancy not to be used for treating hypertension in pregnancy

Breast-feeding manufacturer advises avoid—no information available

Contra-indications hyperkalaemia; anuria; Addison's disease

Side-effects include gastro-intestinal disturbances, dry mouth, rashes, confusion, postural hypotension, hyperkalaemia, hyponatraemia

Licensed use Not licensed for use in children

Indication and dose

Adjunct to thiazide or loop diuretics in oedema or congestive heart failure (where potassium conservation desirable)

- By mouth

Neonate 100–200 micrograms/kg twice daily

Child 1 month–12 years 100–200 micrograms/kg twice daily; max. 20 mg daily

Child 12–18 years 5–10 mg twice daily

Amiloride (Non-proprietary) (POM)

Tablets, amiloride hydrochloride 5 mg, net price 28-tab pack = £1.03p

Oral solution, sugar-free, amiloride hydrochloride 5 mg/5 mL, net price 150 mL = £39.73

Brands include *Amilamont*[®] (*excipients include* propylene glycol, see Excipients p. 3)

▲ **Compound preparations with thiazide or loop diuretics**

See section 2.2.4

Aldosterone antagonists

SPIRONOLACTONE

Cautions potential metabolic products carcinogenic in *rodents*; monitor electrolytes (discontinue if hyperkalaemia); acute porphyria (section 9.8.2);
interactions: Appendix 1 (diuretics)

Renal impairment monitor plasma-potassium concentration; high risk of hyperkalaemia in renal impairment; manufacturer advises avoid if rapidly deteriorating or severe impairment

Pregnancy feminisation of male fetus in *animal* studies

Breast-feeding metabolites present in milk but unlikely to be harmful; manufacturer advises avoid

Contra-indications hyperkalaemia, hyponatraemia; Addison's disease

Side-effects gastro-intestinal disturbances; impotence, gynaecomastia; menstrual irregularities; lethargy, headache, confusion; rashes; hyperkalaemia (discontinue); hyponatraemia; hepatotoxicity, osteomalacia, and blood disorders reported

Licensed use Not licensed for reduction of hypokalaemia induced by diuretics or amphotericin

Indication and dose

Diuresis in congestive heart failure, ascites and oedema, reduction of hypokalaemia induced by diuretics or amphotericin

- By mouth

Neonate 1–2 mg/kg daily in 1–2 divided doses; up to 7 mg/kg daily in resistant ascites

◁ SPIRONOLACTONE (continued)

Child 1 month–12 years 1–3 mg/kg daily in 1–2 divided doses; up to 9 mg/kg daily in resistant ascites

Child 12–18 years 50–100 mg daily in 1–2 divided doses; up to 9 mg/kg daily (max. 400 mg daily) in resistant ascites

Spirolactone (Non-proprietary) (POM)

Tablets, spironolactone 25 mg, net price 28 = £1.76; 50 mg, 28 = £2.53; 100 mg, 28 = £3.55. Label: 21

Oral suspensions, spironolactone 5 mg/5 mL, 10 mg/5 mL, 25 mg/5 mL, 50 mg/5 mL, and 100 mg/5 mL

Available from 'special-order' manufacturers or specialist importing companies, see p.943

Aldactone® (Pharmacia) (POM)

Tablets, f/c, spironolactone 25 mg (buff), net price 100-tab pack = £8.89; 50 mg (off-white), 100-tab pack = £17.78; 100 mg (buff), 28-tab pack = £9.96. Label: 21

POTASSIUM CANRENOATE

Cautions potential metabolic products carcinogenic in *rodents*; monitor electrolytes (discontinue if hyperkalaemia); hypotension; acute porphyria (section 9.8.2); **interactions**: Appendix 1 (diuretics)

Renal impairment use with caution and monitor plasma-potassium concentration if estimated glomerular filtration rate 30–60 mL/minute/1.73 m²; avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Contra-indications hyperkalaemia; hyponatraemia

Pregnancy crosses placenta; feminisation and undescended testes in male fetus in *animal* studies—manufacturer advises avoid

Breast-feeding present in breast milk—manufacturer advises avoid

Side-effects drowsiness, headache, ataxia; menstrual irregularities; hyperuricaemia; pain at injection site on rapid administration; *less commonly* thrombocytopenia, eosinophilia, and hyperkalaemia; *rarely* hepatotoxicity, agranulocytosis, osteomalacia, hoarseness and deepening of voice, hypersensitivity reactions (including urticaria and erythema), and alopecia; also gas-

tro-intestinal disturbances, hypotension, transient confusion with high doses, hyponatraemia, hypochloaemic acidosis, mastalgia, gynaecomastia, and hirsutism

Licensed use not licensed for use in the UK

Indication and dose

Short-term diuresis in congestive heart failure, oedema, and ascites

- By intravenous injection over at least 3 minutes or intravenous infusion

Neonate 1–2 mg/kg twice daily

Child 1 month–12 years 1–2 mg/kg twice daily

Child 12–18 years 1–2 mg/kg (max. 200 mg) twice daily

Note To convert to equivalent oral spironolactone dose, multiply potassium canrenoate dose by 0.7

Administration consult product literature

▲ Preparations

Potassium canrenoate injection is available from 'special-order' manufacturers or specialist importing companies, see p.943

2.2.4 Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe diuretics separately in children, the use of fixed combinations may be justified in older children if compliance is a problem. The most commonly used preparations are listed below (but they may not be licensed for use in children—consult product literature), for other preparations see the BNF. For **interactions**, see Appendix 1 (diuretics).

▲ Amiloride with thiazides

Co-amilozide (Non-proprietary) (POM)

Tablets, co-amilozide 2.5/25 (amiloride hydrochloride 2.5 mg, hydrochlorothiazide 25 mg), net price 28-tab pack = £2.57
Brands include *Moduret 25*®

▲ Amiloride with loop diuretics

Co-amilofruse (Non-proprietary) (POM)

Tablets, co-amilofruse 2.5/20 (amiloride hydrochloride 2.5 mg, furosemide 20 mg). Net price 28-tab pack = £1.19, 56-tab pack = £1.63
Brands include *Frumil LS*®

Tablets, co-amilofruse 5/40 (amiloride hydrochloride 5 mg, furosemide 40 mg). Net price 28-tab pack = £1.24, 56-tab pack = £1.61
Brands include *Frumi*®

Tablets, co-amilofruse 10/80 (amiloride hydrochloride 10 mg, furosemide 80 mg), net price 28-tab pack = £9.33

2.2.5 Osmotic diuretics

Mannitol is used to treat cerebral oedema, raised intra-ocular pressure, peripheral oedema, and ascites.

MANNITOL

Cautions extravasation causes inflammation and thrombophlebitis; monitor fluid and electrolyte balance, serum osmolality, and pulmonary and renal function; assess cardiac function before and during treatment; **interactions:** Appendix 1 (mannitol)

Renal impairment caution in severe impairment

Pregnancy manufacturer advises avoid unless essential—no information available

Breast-feeding manufacturer advises avoid unless essential—no information available

Contra-indications severe heart failure; severe pulmonary oedema; intracranial bleeding (except during craniotomy); anuria; severe dehydration

Side-effects *less commonly* hypotension, thrombophlebitis, fluid and electrolyte imbalance; *rarely* dry mouth, thirst, nausea, vomiting, oedema, raised intracranial pressure, arrhythmia, hypertension, pulmonary oedema, chest pain, headache, convulsions, dizziness, chills, fever, urinary retention, focal osmotic nephrosis, dehydration, cramp, blurred vision, rhinitis, skin necrosis, and hypersensitivity reactions (including urticaria and anaphylaxis); *very rarely* congestive heart failure and acute renal failure

Licensed use not licensed for use in children under 12 years

Indication and dose

Cerebral oedema, raised intra-ocular pressure

- By intravenous infusion over 30–60 minutes
 - Child 1 month–12 years** 0.25–1.5 g/kg repeated if necessary 1–2 times after 4–8 hours
 - Child 12–18 years** 0.25–2 g/kg repeated if necessary 1–2 times after 4–8 hours

Peripheral oedema and ascites

- By intravenous infusion over 2–6 hours
 - Child 1 month–18 years** 1–2 g/kg

Administration examine infusion for crystals; if crystals present, dissolve by warming infusion fluid (allow to cool to body temperature before administration); for mannitol 20%, an in-line filter is recommended (15-micron filters have been used)

Mannitol (Baxter) (POM)

Intravenous infusion, mannitol 10%, net price 500-mL *Viaflex*® bag = £1.87, 500-mL *Viaflo*® bag = £2.15; 20%, 250-mL *Viaflex*® bag = £2.70, 250-mL *Viaflo*® bag = £3.10, 500-mL *Viaflex*® bag = £2.72, 500-mL *Viaflo*® bag = £3.12

2.2.6 Mercurial diuretics

Classification not used in *BNF for Children*.

2.2.7 Carbonic anhydrase inhibitors

The carbonic anhydrase inhibitor **acetazolamide** is a weak diuretic although it is little used for its diuretic effect. Acetazolamide and eye drops of dorzolamide and brinzolamide inhibit the formation of aqueous humour and are used in glaucoma (section 11.6). In children, acetazolamide is also used in the treatment of epilepsy (section 4.8.1), and raised intracranial pressure (section 11.6).

2.2.8 Diuretics with potassium

Diuretics and potassium supplements should be prescribed separately for children.

2.3 Anti-arrhythmic drugs

2.3.1 Management of arrhythmias

2.3.2 Drugs for arrhythmias

2.3.1 Management of arrhythmias

Management of an arrhythmia requires precise diagnosis of the type of arrhythmia; electrocardiography and referral to a paediatric cardiologist is essential; underlying causes such as heart failure require appropriate treatment.

Arrhythmias may be broadly divided into bradycardias, supraventricular tachycardias, and ventricular arrhythmias.

Bradycardia Adrenaline (epinephrine) is useful in the treatment of symptomatic bradycardia in an infant or child.

Supraventricular tachycardias

In supraventricular tachycardia adenosine is given by rapid intravenous injection. If adenosine is ineffective, intravenous amiodarone, flecainide, or a beta-blocker (such as esmolol, see section 2.4) can be tried; verapamil can also be considered in children over 1 year. Atenolol, sotalol (section 2.4), and flecainide are used for the prophylaxis of paroxysmal supraventricular tachycardias.

The use of d.c. shock and vagal stimulation also have a role in the treatment of supraventricular tachycardia.

Syndromes associated with accessory conducting pathways Amiodarone, flecainide, or a beta-blocker is used to prevent recurrence of supraventricular tachycardia in infants and young children with these syndromes (e.g. Wolff-Parkinson-White syndrome).

Atrial flutter In atrial flutter without structural heart defects, sinus rhythm is restored with d.c. shock or cardiac pacing; drug treatment is usually not necessary. Amiodarone is used in atrial flutter when structural heart defects are present or after heart surgery. Sotalol (section 2.4) may also be considered.

Atrial fibrillation Atrial fibrillation is very rare in children. To restore sinus rhythm d.c. shock is used; beta-blockers, alone or together with digoxin, may be useful for ventricular rate control.

Ectopic tachycardia Intravenous amiodarone is used in conjunction with body cooling and synchronised pacing in *postoperative* junctional ectopic tachycardia. Oral amiodarone or flecainide are used in *congenital* junctional ectopic tachycardia.

Amiodarone, flecainide, or a beta-blocker are used in atrial ectopic tachycardia; amiodarone is preferred in those with poor ventricular function.

Ventricular tachycardia and ventricular fibrillation

Pulseless ventricular tachycardia or ventricular fibrillation require resuscitation, see Paediatric Advanced Life Support algorithm (inside back cover). Amiodarone is used in resuscitation for pulseless ventricular tachycardia or ventricular fibrillation unresponsive to d.c. shock; lidocaine can be used as an alternative only if amiodarone is not available.

Amiodarone is also used in a haemodynamically stable child where drug treatment is required; lidocaine can be used as an alternative only if amiodarone is not available.

Torsade de pointes Torsade de pointes is a form of ventricular tachycardia associated with long QT syndrome, which may be congenital or drug induced. Episodes may be self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous magnesium sulphate (section 9.5.1.3) can be used to treat torsade de pointes (dose recommendations vary—consult local guidelines). Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

2.3.2 Drugs for arrhythmias

Anti-arrhythmic drugs can be classified clinically as those acting on supraventricular arrhythmias (adenosine, digoxin, and verapamil), those acting on both supraventricular and ventricular arrhythmias (amiodarone, beta-blockers, flecainide and procainamide), and those acting on ventricular arrhythmias (lidocaine (lignocaine)). For the treatment of bradycardia, see section 2.3.1.

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:

Class I: membrane stabilising drugs (e.g. lidocaine, flecainide)

Class II: beta-blockers

Class III: amiodarone and sotalol (also Class II)

Class IV: calcium-channel blockers (includes verapamil but not dihydropyridines)

Cautions The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most or all drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

Adenosine is the treatment of choice for terminating supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome). It is also used in the diagnosis of supraventricular arrhythmias. It is not negatively inotropic and does not cause significant hypotension; it can be used safely in children with impaired cardiac function or postoperative arrhythmias. The injection should be administered by rapid intravenous injection into a central or large peripheral vein.

Amiodarone is useful in the management of both supraventricular and ventricular tachyarrhythmias. It may be given by intravenous infusion and by mouth and causes little or no myocardial depression. Unlike oral amiodarone, intravenous amiodarone acts relatively rapidly. Intravenous amiodarone is also used in cardiopulmonary resuscitation for ventricular fibrillation or pulseless ventricular tachycardia unresponsive to d.c. shock (see algorithm, inside back cover).

Amiodarone has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses may cause nausea unless divided). Many weeks or months may be required to achieve steady-state plasma-amiodarone concentration; this is particularly important when drug interactions are likely (see also Appendix 1).

Most patients taking amiodarone develop corneal microdeposits (reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlights at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought. Because of the possibility of phototoxic reactions, children and carers should be advised to shield the child's skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen (section 13.8.1) should be used to protect against both long-wave ultraviolet and visible light.

Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Clinical assessment alone is unreliable, and laboratory tests should be performed before treatment and every 6 months. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore tri-iodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis. The thyrotoxicosis may be very refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone. Fresh neurological symptoms should raise the possibility of peripheral neuropathy. Amiodarone is also associated with hepatotoxicity (see under amiodarone, below).

Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart, for details see section 2.4. For special reference to the role of **sotalol** in ventricular arrhythmias, see section 2.4.

Oral administration of **digoxin** (section 2.1.1) slows the ventricular rate in atrial fibrillation and in atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate.

Flecainide is useful for the treatment of resistant re-entry supraventricular tachycardia, ventricular tachycardia, ventricular ectopic beats, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), and paroxysmal atrial fibrillation. Flecainide crosses the placenta and can be used to control fetal supraventricular arrhythmias.

Lidocaine (lignocaine) can be used in cardiopulmonary resuscitation in children with ventricular fibrillation or pulseless ventricular tachycardia unresponsive to d.c. shock, but only if amiodarone is not available. Doses may need to be reduced in children with persistently poor cardiac output and hepatic or renal failure (see under lidocaine, below).

Verapamil (section 2.6.2) can cause severe haemodynamic compromise (refractory hypotension and cardiac arrest) when used for the acute treatment of arrhythmias in neonates and infants; it is contra-indicated in children under 1 year. It is also contra-indicated in those with congestive heart failure, syndromes associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) and in most receiving concomitant beta-blockers. It can be useful in older children with supraventricular tachycardia.

ADENOSINE

Cautions atrial fibrillation or flutter with accessory pathway (conduction down anomalous pathway may increase); asthma; ECG monitoring should be carried out and resuscitation facilities should be available during administration; **interactions:** Appendix 1 (adenosine)

Pregnancy no evidence of harm

Breast-feeding no information available—unlikely to be present in milk owing to short half-life

Contra-indications second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted)

Side-effects include transient facial flush, chest pain, dyspnoea, bronchospasm, choking sensation, nausea, light-headedness; severe bradycardia reported (requiring temporary pacing); ECG may show transient rhythm disturbances

Licensed use not licensed for use in children

Indication and dose

Arrhythmias (see also section 2.3.1), **diagnosis of arrhythmias**

- By intravenous injection

Neonates 150 micrograms/kg; if necessary repeat injection every 1–2 minutes increasing dose by 50–100 micrograms/kg until tachycardia terminated or max. single dose of 300 micrograms/kg given

Child 1 month–1 year 150 micrograms/kg; if necessary repeat injection every 1–2 minutes increasing the dose by 50–100 micrograms/kg until tachycardia terminated or max. single dose of 500 micrograms/kg given

grams/kg until tachycardia terminated or max. single dose of 500 micrograms/kg given

Child 1–12 years 100 micrograms/kg; if necessary repeat injection every 1–2 minutes increasing dose by 50–100 micrograms/kg until tachycardia terminated or max. single dose of 500 micrograms/kg given

Child 12–18 years initially 3 mg; if necessary followed by 6 mg after 1–2 minutes, and then by 12 mg after a further 1–2 minutes

Note In some children over 12 years 3-mg dose ineffective (e.g. if a small peripheral vein is used for administration) and higher initial dose sometimes used; however, those with *heart transplant* are **very sensitive** to the effects of adenosine, and should not receive higher initial doses. In children receiving dipyridamole reduce dose to a quarter of usual dose of adenosine

Administration by *rapid intravenous injection* over 2 seconds into central or large peripheral vein followed by rapid Sodium Chloride 0.9% flush; Injection solution may be diluted with Sodium Chloride 0.9% if required

Adenocor® (Sanofi-Synthelabo) (POM)

Injection, adenosine 3 mg/mL in physiological saline, net price 2-mL vial = £4.45 (hosp. only)

Note Intravenous infusion of adenosine (*Adenoscan®*, Sanofi Winthrop) may be used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate—consult product literature

AMIODARONE HYDROCHLORIDE

Cautions liver-function and thyroid-function tests required before treatment and then every 6 months (see notes above for tests of thyroid function); hypokalaemia (measure serum-potassium concentration before treatment); pulmonary function tests and chest x-ray required before treatment; heart failure; severe bradycardia and

conduction disturbances in excessive dosage; intravenous use may cause moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdose) or severe hepato-cellular toxicity (monitor transaminases closely); ECG monitoring and resuscitation facilities must be available during

◊ AMIODARONE HYDROCHLORIDE (continued)

intravenous use; acute porphyria (section 9.8.2); avoid benzyl alcohol containing injections in neonates (see Excipients, p. 3); **interactions:** Appendix 1 (amiodarone)

Contra-indications (except in cardiac arrest) sinus bradycardia, sino-atrial heart block; unless pacemaker fitted avoid in severe conduction disturbances or sinus node disease; thyroid dysfunction; iodine sensitivity; avoid *intravenous use* in severe respiratory failure, circulatory collapse, or severe arterial hypotension; avoid bolus injection in congestive heart failure or cardiomyopathy

Pregnancy possible risk of neonatal goitre if amiodarone used in second or third trimester; use only if no alternative

Breast-feeding avoid; significant amount present in milk—theoretical risk of neonatal thyroid dysfunction

Side-effects nausea, vomiting, taste disturbances, raised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders), jaundice; bradycardia (see Cautions); pulmonary toxicity (including pneumonitis and fibrosis); tremor, sleep disorders; hypothyroidism, hyperthyroidism; reversible corneal microdeposits (sometimes with night glare); phototoxicity, persistent slate-grey skin discoloration (see also notes above); *less commonly* onset or worsening of arrhythmia, conduction disturbances (see Cautions), peripheral neuropathy and myopathy (usually reversible on withdrawal); *very rarely* chronic liver disease including cirrhosis, sinus arrest, bronchospasm (in patients with severe respiratory failure), ataxia, benign intracranial hypertension, headache, vertigo, epididymo-orchitis, impotence, haemolytic or aplastic anaemia, thrombocytopenia, rash (including exfoliative dermatitis), hypersensitivity including vasculitis, alopecia, impaired vision due to optic neuritis or optic neuropathy (including blindness), anaphylaxis on rapid injection, also hypotension, respiratory distress syndrome, sweating, and hot flushes

Licensed use Not licensed for use in children under 3 years

Indication and dose

Supraventricular and ventricular arrhythmias see notes above (initiated in hospital or under specialist supervision)

• By mouth

Neonate initially 5–10 mg/kg twice daily for 7–10 days, then reduced to maintenance dose of 5–10 mg/kg once daily

Child 1 month–12 years initially 5–10 mg/kg (max. 200 mg) twice daily for 7–10 days, then reduced to maintenance dose of 5–10 mg/kg once daily (max. 200 mg daily)

Child 12–18 years 200 mg 3 times daily for 1 week then 200 mg twice daily for 1 week then usually 200 mg daily adjusted according to response

• By intravenous infusion

Neonate initially 5 mg/kg over 30 minutes then 5 mg/kg over 30 minutes every 12–24 hours

Child 1 month–18 years initially 5–10 mg/kg over 20 minutes–2 hours then *by continuous infusion* 300 micrograms/kg/hour, increased according to response to max. 1.5 mg/kg/hour; do not exceed 1.2 g in 24 hours

Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation (see also section 2.3.1)

• By intravenous injection

Neonate 5 mg/kg over at least 3 minutes

Child 1 month–18 years 5 mg/kg (max. 300 mg) over at least 3 minutes

Administration Intravenous administration via central venous catheter preferred. For *intravenous infusion* dilute with Glucose 5% to a concentration of not less than 600 micrograms/mL; incompatible with Sodium Chloride infusion; avoid equipment containing the plasticizer di-2-ethylhexphthalate (DEHP).

For administration *by mouth*, tablets may be crushed and dispersed in water; injection solution should **not** be given orally (irritant)

Amiodarone (Non-proprietary) ^(POM)

Tablets, amiodarone hydrochloride 100 mg, net price 28-tab pack = £1.39; 200 mg, 28-tab pack = £1.42. Label: 11
Brands include *Amyben*[®]

Injection, amiodarone hydrochloride 30 mg/mL, net price 10-mL pre-filled syringe = £10.25

Excipients may include benzyl alcohol (avoid in neonates unless no safer alternative available, see Excipients, p. 3)

Sterile concentrate, amiodarone hydrochloride 50 mg/mL, net price 3-mL amp = £1.33, 6-mL amp = £2.86. For dilution and use as an infusion

Excipients may include benzyl alcohol (avoid in neonates unless no safer alternative available, see Excipients, p. 3)

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

Cordarone X[®] (Sanofi-Aventis) ^(POM)

Tablets, scored, amiodarone hydrochloride 100 mg, net price 28-tab pack = £4.45; 200 mg, 28-tab pack = £7.27. Label: 11

Sterile concentrate, amiodarone hydrochloride 50 mg/mL, net price 3-mL amp = £1.33. For dilution and use as an infusion

Excipients include benzyl alcohol (avoid in neonates unless no safer alternative available, see Excipients, p. 3)

FLECAINIDE ACETATE

Cautions children with pacemakers (especially those who may be pacemaker dependent because

stimulation threshold may rise appreciably); atrial fibrillation following heart surgery; monitor ECG

◊ FLECAINIDE ACETATE (continued)

and have resuscitation facilities available during intravenous use; **interactions:** Appendix 1 (flecainide)

Hepatic impairment avoid or reduce dose in severe impairment; monitor plasma concentration (see pharmacokinetics below)

Renal impairment reduce dose by 25–50% if estimated glomerular filtration rate less than 35 mL/minute/1.73 m² and monitor plasma-flecainide concentration

Pregnancy used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in *animal* studies; infant hyperbilirubinaemia also reported

Breast-feeding significant amount present in milk but not known to be harmful

Contra-indications heart failure; abnormal left ventricular function; long-standing atrial fibrillation where conversion to sinus rhythm not attempted; haemodynamically significant valvular heart disease; avoid in sinus node dysfunction, atrial conduction defects, second-degree or greater AV block, bundle branch block or distal block unless pacing rescue available

Side-effects oedema, pro-arrhythmic effects; dyspnoea; dizziness, asthenia, fatigue, fever; visual disturbances; *rarely* pneumonitis, hallucinations, depression, confusion, amnesia, dyskinesia, convulsions, peripheral neuropathy; *also reported* gastro-intestinal disturbances, anorexia, hepatic dysfunction, flushing, syncope, drowsiness, tremor, vertigo, headache, anxiety, insomnia, ataxia, paraesthesia, hypoaesthesia, anaemia, leucopenia, thrombocytopenia, corneal deposits, tinnitus, increased antinuclear antibodies, hypersensitivity reactions (including rash, urticaria, and photosensitivity), increased sweating

Pharmacokinetics plasma-flecainide concentration for optimal response 200–800 micrograms/litre; blood sample should be taken immediately before next dose

Licensed use Not licensed for use in children under 12 years

Indication and dose

Resistant re-entry supraventricular tachycardia, ventricular ectopic beats or ventricular tachycardia, arrhythmias associated with accessory conduction pathways (e.g. Wolff-Parkinson-White syndrome), paroxysmal atrial fibrillation

• By mouth

Neonate 2 mg/kg 2–3 times daily adjusted according to response and plasma-flecainide concentration

Child 1 month–12 years 2 mg/kg 2–3 times daily adjusted according to response and plasma-flecainide concentration (max. 8 mg/kg/day or 300 mg daily)

Child 12–18 years initially 50–100 mg twice daily; max. 300 mg daily (max. 400 mg daily for ventricular arrhythmias in heavily built children)

• By slow intravenous injection or intravenous infusion

Neonate 1–2 mg/kg over 10–30 minutes; if necessary followed by continuous infusion at a rate of 100–250 micrograms/kg/hour until arrhythmia controlled; transfer to *oral* treatment as above

Child 1 month–12 years 2 mg/kg over 10–30 minutes; if necessary followed by continuous infusion at a rate of 100–250 micrograms/kg/hour until arrhythmia controlled (max. cumulative dose 600 mg in 24 hours); transfer to *oral* treatment as above

Child 12–18 years 2 mg/kg (max. 150 mg) over 10–30 minutes; if necessary followed by continuous infusion at a rate of 1.5 mg/kg/hour for 1 hour, then reduced to 100–250 micrograms/kg/hour until arrhythmia controlled (max. cumulative dose 600 mg in first 24 hours); transfer to *oral* treatment as above

Administration for administration *by mouth*, milk, infant formula, and dairy products may reduce absorption of flecainide—separate doses from feeds. Liquid has a local anaesthetic effect and should be given at least 30 minutes before or after food. Do not store liquid in refrigerator as precipitation occurs.

For *intravenous administration*, give initial dose over 30 minutes in children with sustained ventricular tachycardia or cardiac failure.

Dilute injection using Glucose 5%; concentrations of more than 300 micrograms/mL are unstable in chloride containing solutions

Flecainide (Non-proprietary) (POM)

Tablets, flecainide acetate 50 mg, net price 60-tab pack = £9.81; 100 mg, 60-tab pack = £15.04

Liquid, available from 'special-order' manufacturers or specialist importing companies, see p. 943

Tambacor® (3M) (POM)

Tablets, flecainide acetate 50 mg, net price 60-tab pack = £14.46; 100 mg (scored), 60-tab pack = £20.66

Injection, flecainide acetate 10 mg/mL, net price 15-mL amp = £4.40

▲ Modified release

Tambacor® XL (Meda) (POM)

Capsules, m/r, grey/pink, flecainide acetate 200 mg, net price 30-cap pack = £14.77. Label: 25

Dose

Supraventricular arrhythmias

• By mouth

Child 12–18 years 200 mg once daily

Note Not to be used to control arrhythmias in acute situations; children stabilised on 200 mg daily of immediate-release flecainide may be transferred to *Tambacor® XL*

LIDOCAINE HYDROCHLORIDE

(Lignocaine hydrochloride)

Cautions lower doses in congestive heart failure and following cardiac surgery; monitor ECG; resuscitation facilities should be available; **interactions:** Appendix 1 (lidocaine)

Hepatic impairment manufacturer advises caution—increased risk of side-effects

Renal impairment possible accumulation of lidocaine and active metabolite; manufacturers advise caution in severe impairment

Pregnancy crosses the placenta but not known to be harmful in *animal* studies—use if benefit outweighs risk

Breast-feeding present in milk but amount too small to be harmful

Contra-indications sino-atrial disorders, all grades of atrioventricular block, severe myocardial depression; acute porphyria (section 9.8.2)

Side-effects dizziness, paraesthesia, or drowsiness (particularly if injection too rapid); other CNS effects include confusion, respiratory depression and convulsions; hypotension and bradycardia (may lead to cardiac arrest); *rarely* hypersensitivity reactions including anaphylaxis

Licensed use not licensed for use in children under 1 year

Indication and dose

Ventricular arrhythmias, pulseless ventricular tachycardia or ventricular fibrillation

- By intravenous or intraosseous injection, and intravenous infusion

Neonate 0.5–1 mg/kg by injection followed by infusion of 0.6–3 mg/kg/hour; if infusion not immediately available following initial injection, injection of 0.5–1 mg/kg may be repeated at

intervals of not less than 5 minutes (to max. total dose 3 mg/kg)

Child 1 month–12 years 0.5–1 mg/kg by injection followed by infusion of 0.6–3 mg/kg/hour; if infusion not immediately available following initial injection, injection of 0.5–1 mg/kg may be repeated at intervals of not less than 5 minutes (to max. total dose 3 mg/kg)

Child 12–18 years 50–100 mg by injection followed by infusion of 120 mg over 30 minutes then 240 mg over 2 hours then 60 mg/hour; reduce dose further if infusion continued beyond 24 hours; if infusion not immediately available following initial injection, injection of 50–100 mg may be repeated at intervals of not less than 5 minutes (to max. 300 mg in 1 hour)

Administration For *intravenous infusion* dilute with glucose 5% intravenous infusion or sodium chloride 0.9%

For use as a local anaesthetic see section 15.2

Lidocaine (Non-proprietary) (POM)

Injection 2%, lidocaine hydrochloride 20 mg/mL, net price 2-mL amp = 28p; 5-mL amp = 26p; 10-mL amp = 60p; 20-mL amp = 61p
Available from Braun

Infusion, lidocaine hydrochloride 0.1% (1 mg/mL) and 0.2% (2 mg/mL) in glucose intravenous infusion 5%. 500-mL containers
Available from Baxter

Minijet® Lignocaine (UCB Pharma) (POM)

Injection, lidocaine hydrochloride 1% (10 mg/mL), net price 10-mL disposable syringe = £4.85; 2% (20 mg/mL), 5-mL disposable syringe = £4.73

2.4 Beta-adrenoceptor blocking drugs

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are available but experience in children is limited to the use of only a few.

Differences between beta-blockers may affect choice. The water-soluble beta-blockers, atenolol and sotalol, are less likely to enter the brain and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Some beta-blockers, such as atenolol, have an intrinsically longer duration of action and need to be given only once daily. Carvedilol and labetalol are beta-blockers which have, in addition, an arteriolar vasodilating action and thus lower peripheral resistance. Although carvedilol and labetalol possess both alpha- and beta-blocking properties, these drugs have no important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in children with second- or third-degree heart block. Sotalol may prolong the QT interval, and it occasionally causes life-threatening ventricular arrhythmias (**important**): particular care is required to avoid hypokalaemia in children taking sotalol).

Beta-blockers can precipitate asthma and they should be **avoided** in children with a history of asthma or bronchospasm; if there is no alternative, a cardioselective beta-blocker can be used with extreme caution under specialist supervision. Atenolol and metoprolol have less effect on the beta₂ (bronchial) receptors and are, therefore, relatively *cardioselective*, but they are **not** *cardiospecific*. They have a lesser effect on airways resistance but are **not** free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities, and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers, see above).

Beta-blockers are not contra-indicated in diabetes; however, they can lead to a small deterioration of glucose tolerance and interfere with metabolic and autonomic responses to hypoglycaemia. The cardioselective beta-blockers (e.g. atenolol and metoprolol) may be preferable in diabetes but beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia.

Hypertension Beta-blockers are effective for reducing blood pressure (section 2.5), but their mode of action is not understood; they reduce cardiac output, alter baroreceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action. Blood pressure can usually be controlled with relatively few side-effects. In general the dose of beta-blocker does not have to be high.

Labetalol may be given intravenously for *hypertensive emergencies* in children (section 2.5); however, care is needed to avoid dangerous hypotension or beta-blockade, particularly in neonates. **Esmolol** is also used intravenously for the treatment of hypertension particularly in the peri-operative period.

Beta-blockers can be used to control the pulse rate in children with *phaeochromocytoma* (section 2.5.4). However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis; phenoxybenzamine should always be used together with the beta-blocker.

Arrhythmias In arrhythmias (section 2.3), beta-blockers act principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used alone or in conjunction with digoxin to control the ventricular rate in *atrial fibrillation*. Beta-blockers are also useful in the management of *supraventricular tachycardias* and *ventricular tachycardias* particularly to prevent recurrence of the tachycardia.

Esmolol is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias and sinus tachycardia, particularly in the peri-operative period.

Sotalol is a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity. Atenolol and sotalol suppress ventricular ectopic beats and non-sustained ventricular tachycardia (section 2.3.1). However, the pro-arrhythmic effects of sotalol, particularly in children with sick sinus syndrome, may prolong the QT interval and induce torsade de pointes.

Heart failure Beta-blockers may produce benefit in heart failure by blocking sympathetic activity and the addition of a beta-blocker such as **carvedilol** to other treatment for heart failure may be beneficial. Treatment should be initiated by those experienced in the management of heart failure (see section 2.2 for details on heart failure).

Thyrotoxicosis Beta-blockers are used in the management of *thyrotoxicosis* including neonatal thyrotoxicosis; **propranolol** can reverse clinical symptoms within 4 days. Beta-blockers are also used for the pre-operative preparation for thyroidectomy; the thyroid gland is rendered less vascular, thus facilitating surgery (section 6.2.2).

Other uses In tetralogy of Fallot, esmolol or propranolol may be given intravenously in the initial management of *cyanotic spells*; propranolol is given by mouth for preventing cyanotic spells. If a severe cyanotic spell in a child with congenital heart disease persists despite optimal use of 100% oxygen, propranolol is given by intravenous infusion (for dose, see below). If cyanosis is still present after 10 minutes, sodium bicarbonate intravenous infusion is given in a dose of 1 mmol/kg to correct acidosis (or dose calculated according to arterial blood gas

results); sodium bicarbonate 4.2% intravenous infusion is appropriate for a child under 1 year and sodium bicarbonate 8.4% intravenous infusion in children over 1 year. If blood-glucose concentration is less than 3 mmol/litre, glucose 10% intravenous infusion is given in a dose of 2 mL/kg (glucose 200 mg/kg) over 10 minutes, followed by morphine in a dose of 100 micrograms/kg by intravenous or intramuscular injection.

Beta-blockers are also used in the *prophylaxis of migraine* (section 4.7.4.2). Betaxolol, carteolol, levobunolol, and timolol are used topically in *glaucoma* (section 11.6).

PROPRANOLOL HYDROCHLORIDE

Cautions see notes above; also avoid abrupt withdrawal; first-degree AV block; portal hypertension (risk of deterioration in liver function); diabetes (see also notes above); history of obstructive airways disease (introduce cautiously and monitor lung function—see also Bronchospasm below); myasthenia gravis; symptoms of thyrotoxicosis may be masked (see also notes above); psoriasis; history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response, also may reduce response to adrenaline (epinephrine); **interactions:** Appendix 1 (beta-blockers), **important:** verapamil interaction, see also p. 140

Hepatic impairment reduce oral dose in liver disease

Renal impairment manufacturer advises caution—dose reduction may be required

Pregnancy may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; risk greater in severe hypertension

Breast-feeding present in milk but amount probably too small to be harmful; monitor infant for symptoms of beta-blockade

Contra-indications asthma (**important:** see Bronchospasm below), uncontrolled heart failure, marked bradycardia, hypotension, sick sinus syndrome, second- or third- degree AV block, cardiogenic shock, metabolic acidosis, severe peripheral arterial disease; phaeochromocytoma (apart from specific use with alpha-blockers, see also notes above)

Bronchospasm The CSM has advised that beta-blockers, including those considered to be cardioselective, should not be given to patients with a history of asthma or bronchospasm. However, in rare situations where there is no alternative a cardioselective beta-blocker is given to these patients with extreme caution and under specialist supervision

Side-effects see notes above; also gastro-intestinal disturbances; bradycardia, heart failure, hypotension, conduction disorders, peripheral vasoconstriction (including exacerbation of intermittent claudication and Raynaud's phenomenon); bronchospasm (see above), dyspnoea; headache, fatigue, sleep disturbances, paraesthesia, dizziness, psychoses; sexual dysfunction; purpura, thrombocytopenia; visual disturbances; exacerbation of psoriasis, alopecia; *rarely* rashes and dry eyes (reversible on withdrawal); **overdosage:** see Emergency Treatment of Poisoning, p. 41

Licensed use not licensed for treatment of hypertension in children under 12 years

Indication and dose

Arrhythmias

• By mouth

Neonate 250–500 micrograms/kg 3 times daily, adjusted according to response

Child 1 month–18 years 250–500 micrograms/kg 3–4 times daily, adjusted according to response; max. 1 mg/kg 4 times daily, total daily dose not to exceed 160 mg daily

• By slow intravenous injection, with ECG monitoring

Neonate 20–50 micrograms/kg repeated if necessary every 6–8 hours

Child 1 month–18 years 25–50 micrograms/kg repeated every 6–8 hours if necessary

Hypertension

• By mouth

Neonate initially, 250 micrograms/kg 3 times daily, increased if necessary to max. 2 mg/kg 3 times daily

Child 1 month–12 years 0.25–1 mg/kg 3 times daily, increased at weekly intervals to max. 5 mg/kg daily

Child 12–18 years initially 80 mg twice daily; increased at weekly intervals as required; maintenance 160–320 mg daily; slow-release preparations may be used for once daily administration

Tetralogy of Fallot

• By mouth

Neonate 0.25–1 mg/kg 2–3 times daily, max. 2 mg/kg 3 times daily

Child 1 month–12 years 0.25–1 mg/kg 3–4 times daily, max. 5 mg/kg daily

• By slow intravenous injection with ECG monitoring

Neonate initially 15–20 micrograms/kg (max. 100 micrograms/kg), repeated every 12 hours if necessary

Child 1 month–12 years initially 15–20 micrograms/kg (max. 100 micrograms/kg), repeated every 6–8 hours if necessary; higher doses rarely necessary

□ PROPRANOLOL HYDROCHLORIDE (continued)

Migraine prophylaxis

• By mouth

Child 2–12 years 200–500 micrograms/kg 3 times daily; max. 4 mg/kg daily, usual dose 10–20 mg 2–3 times daily

Child 12–18 years 20–40 mg 2–3 times daily; maintenance 80–160 mg daily

Administration Give by slow intravenous injection over at least 3–5 minutes. Rate of administration should not exceed 1 mg/minute. May be diluted with Sodium Chloride 0.9% or Glucose 5%. Incompatible with bicarbonate.

Note Excessive bradycardia can be countered with intravenous injection of atropine sulphate; for **overdosage** see Emergency Treatment of Poisoning, p. 41

Propranolol (Non-proprietary) (POM)

Tablets, propranolol hydrochloride 10 mg, net price 28 = 91p; 40 mg, 28 = 97p; 80 mg, 56 = £1.68; 160 mg, 56 = £3.29. Label: 8

Brands include *Angilol*[®]

Oral solution, propranolol hydrochloride 5 mg/5 mL, net price 150 mL = £12.50; 10 mg/5 mL, 150 mL = £16.45; 50 mg/5 mL, 150 mL = £19.98. Label: 8

Brands include *Syprol*[®]

Inderal[®] (AstraZeneca) (POM)

Injection, propranolol hydrochloride 1 mg/mL, net price 1-mL amp = 21p

■ Modified release

Note Modified-release preparations for once daily administration; use in older children only

Half-Inderal LA[®] (AstraZeneca) (POM)

Capsules, m/r, lavender/pink, propranolol hydrochloride 80 mg. Net price 28-cap pack = £5.40. Label: 8, 25

Note Modified-release capsules containing propranolol hydrochloride 80 mg also available; brands include *Bedranol SR*[®], *Half Beta Prograne*[®]

Inderal-LA (AstraZeneca) (POM)

Capsules, m/r, lavender/pink, propranolol hydrochloride 160 mg. Net price 28-cap pack = £6.67. Label: 8, 25

Note Modified-release capsules containing propranolol hydrochloride 160 mg also available; brands include *Bedranol SR*[®], *Beta-Prograne*[®], *Slo-Pro*[®]

ATENOLOL

Cautions see under Propranolol Hydrochloride

Renal impairment initially use 50% of usual dose if estimated glomerular filtration rate 10–35 mL/minute/1.73 m²; initially use 30–50% of usual dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Pregnancy may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; risk greater in severe hypertension

Breast-feeding present in milk in greater amounts than some other beta-blockers; possible toxicity due to beta-blockade—monitor infant and use with caution

Contra-indications see under Propranolol Hydrochloride

Side-effects see under Propranolol Hydrochloride

Licensed use not licensed for use in children under 12 years

Indication and dose

Hypertension

• By mouth

Neonate 0.5–2 mg/kg once daily; may be given in 2 divided doses

Child 1 month–12 years 0.5–2 mg/kg once daily (doses higher than 50 mg daily rarely necessary); may be given in 2 divided doses

Child 12–18 years 25–50 mg once daily (higher doses rarely necessary); may be given in 2 divided doses

Arrhythmias

• By mouth

Neonate 0.5–2 mg/kg once daily; may be given in 2 divided doses

Child 1 month–12 years 0.5–2 mg/kg once daily (max. 100 mg daily); may be given in 2 divided doses

Child 12–18 years 50–100 mg once daily; may be given in 2 divided doses

Atenolol (Non-proprietary) (POM)

Tablets, atenolol 25 mg, net price 28-tab pack = 81p; 50 mg, 28-tab pack = 85p; 100 mg, 28-tab pack = 86p. Label: 8

Brands include *Atenix*[®]

Tenormin[®] (AstraZeneca) (POM)

'25' tablets, f/c, atenolol 25 mg, net price 28-tab pack = £4.41. Label: 8

LS tablets, orange, f/c, scored, atenolol 50 mg, net price 28-tab pack = £5.11. Label: 8

Tablets, orange, f/c, scored, atenolol 100 mg, net price 28-tab pack = £6.50. Label: 8

Syrup, sugar-free, atenolol 25 mg/5 mL, net price 300 mL = £8.55. Label: 8

CARVEDILOL

Cautions see under Propranolol Hydrochloride; monitor renal function during dose titration in children with heart failure who also have low blood pressure, renal impairment, ischaemic heart disease, or diffuse vascular disease

Pregnancy see under Propranolol Hydrochloride; also lack of experience in human pregnancy limits any assessment of fetal risk

Breast-feeding present in milk in *animal* studies but amount probably too small to be harmful; monitor infant for symptoms of alpha- and beta-blockade

Contra-indications see under Propranolol Hydrochloride; acute or decompensated heart failure requiring intravenous inotropes

Hepatic impairment avoid

Side-effects postural hypotension, dizziness, headache, fatigue, gastro-intestinal disturbances, bradycardia; occasionally diminished peripheral circulation, peripheral oedema and painful extremities, dry mouth, dry eyes, eye irritation or disturbed vision, impotence, disturbances of micturition, influenza-like symptoms; rarely angina, AV block, exacerbation of intermittent claudication or Raynaud's phenomenon; allergic skin reactions, exacerbation of psoriasis, nasal stuffiness, wheezing, depressed mood, sleep dis-

turbances, paraesthesia, heart failure, changes in liver enzymes, thrombocytopenia, leucopenia also reported

Licensed use not licensed for use in children under 18 years

Indication and dose

Adjunct in heart failure (limited information available)

• By mouth

Child 2–18 years initially 50 micrograms/kg (max. 3.125 mg) twice daily, double dose at intervals of at least 2 weeks up to 350 micrograms/kg (max. 25 mg) twice daily

Carvedilol (Non-proprietary) (PmI)

Tablets, carvedilol 3.125 mg, net price 28-tab pack = £5.73; 6.25 mg, 28-tab pack = £6.09; 12.5 mg, 28-tab pack = £11.54; 25 mg, 28-tab pack = £21.14. Label: 8

Eucardic® (Roche) (PmI)

Tablets, scored, carvedilol 3.125 mg (pink), net price 28-tab pack = £7.57; 6.25 mg (yellow), 28-tab pack = £8.41; 12.5 mg (peach), 28-tab pack = £9.35; 25 mg, 28-tab pack = £11.68. Label: 8

ESMOLOL HYDROCHLORIDE

Cautions see under Propranolol Hydrochloride

Renal impairment manufacturer advises caution

Contra-indications see under Propranolol Hydrochloride

Side-effects see under Propranolol Hydrochloride; infusion causes venous irritation and thrombophlebitis

Licensed use not licensed for use in children

Indication and dose

Arrhythmias, hypertensive emergencies (see also notes above and section 2.5)

• By intravenous administration

Child 1 month–18 years initially by *intravenous injection* over 1 minute 500 micrograms/kg then by *intravenous infusion* 50 micrograms/kg/minute for 4 minutes (rate reduced if low blood pressure or low heart rate); if inadequate response, repeat loading dose and increase maintenance infusion by 50 micrograms/kg/minute increments; repeat until effective or

max. infusion of 200 micrograms/kg/minute reached; doses over 300 micrograms/kg/minute not recommended

Tetralogy of Fallot

• By intravenous administration

Neonate initially by *intravenous injection* over 1–2 minutes 600 micrograms/kg then if necessary by *intravenous infusion* 300–900 micrograms/kg/minute

Administration Dilute injection solution (with Glucose 5% or Sodium Chloride 0.9%) to a concentration of 10 mg/mL (20 mg/mL if fluid restricted) and give through central venous catheter; incompatible with bicarbonate

Brevibloc® (Baxter) (PmI)

Injection, esmolol hydrochloride 10 mg/mL, net price 10-mL vial = £7.79, 250-mL infusion bag = £89.69

LABETALOL HYDROCHLORIDE

Cautions see under Propranolol Hydrochloride; interferes with laboratory tests for catecholamines; liver damage (see below)

Liver damage Severe hepatocellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted

Renal impairment dose reduction may be required

Pregnancy use in treatment of maternal hypertension does not pose risk, except possibly in first trimester, monitor neonate for signs of alpha- and beta-blockade

Breast-feeding present in milk but amount probably too small to be harmful—monitor infant for possible symptoms of alpha- and beta-blockade

Contra-indications see under Propranolol Hydrochloride

▢ LABETALOL HYDROCHLORIDE (*continued*)

Side-effects postural hypotension (avoid upright position during and for 3 hours after intravenous administration), tiredness, weakness, headache, rashes, scalp tingling, difficulty in micturition, epigastric pain, nausea, vomiting; liver damage (see above); rarely lichenoid rash

Licensed use not licensed for use in children

Indication and dose

Hypertensive emergencies see also section 2.5

• By intravenous infusion

Neonate 500 micrograms/kg/hour adjusted at intervals of at least 15 minutes according to response; max. 4 mg/kg/hour

Child 1 month–12 years initially 0.5–1 mg/kg/hour adjusted at intervals of at least 15 minutes according to response; max. 3 mg/kg/hour

Child 12–18 years 30–120 mg/hour adjusted at intervals of at least 15 minutes according to response

Note Consult local guidelines. In hypertensive encephalopathy reduce blood pressure to normotensive level over 24–48 hours (more rapid reduction may lead to cerebral infarction, blindness, and death). If child fitting, reduce blood pressure rapidly, but not to normal levels

Hypertension

• By mouth

Child 1 month–12 years 1–2 mg/kg 3–4 times a day

Child 12–18 years initially 50–100 mg twice daily increased if required at intervals of 3–14

days to usual dose of 200–400 mg twice daily (3–4 divided doses if higher); max. 2.4 g daily

Administration Injection may be given orally with squash or juice

• By intravenous injection

Child 1 month–12 years 250–500 micrograms/kg as a single dose; max. 20 mg

Child 12–18 years 50 mg over at least 1 minute, repeated after 5 minutes if necessary; max. total dose 200 mg

Note Excessive bradycardia can be countered with intravenous injection of atropine sulphate; for **overdosage** see p. 41

Administration for *intravenous infusion*, dilute to a concentration of 1 mg/mL in Glucose 5% or Sodium Chloride and Glucose 5%; if fluid restricted may be given undiluted, preferably through a central venous catheter

Labetalol Hydrochloride (Non-proprietary) ^(PoM)

Tablets, f/c, labetalol hydrochloride 100 mg, net price 56 = £7.80; 200 mg, 56 = £11.83; 400 mg, 56 = £17.73. Label: 8, 21

Trandate[®] (UCB Pharma) ^(PoM)

Tablets, all orange, f/c, labetalol hydrochloride 50 mg, net price 56-tab pack = £3.79; 100 mg, 56-tab pack = £4.17; 200 mg, 56-tab pack = £6.77; 400 mg, 56-tab pack = £9.42. Label: 8, 21

Injection, labetalol hydrochloride 5 mg/mL, net price 20-mL amp = £2.12

▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

METOPROLOL TARTRATE

Cautions see under Propranolol Hydrochloride

Hepatic impairment reduce dose in severe impairment

Pregnancy see under Propranolol Hydrochloride

Breast-feeding present in milk but amount probably too small to be harmful—monitor infant for possible symptoms of beta-blockade

Contra-indications see under Propranolol Hydrochloride

Side-effects see under Propranolol Hydrochloride

Licensed use not licensed for use in children

Indication and dose

Hypertension

• By mouth

Child 1 month–12 years initially 1 mg/kg twice daily, increased if necessary to max. 8 mg/kg daily in 2–4 divided doses

Child 12–18 years initially 50–100 mg daily increased if necessary to 200 mg daily in 1–2

divided doses; max. 400 mg daily (but high doses rarely necessary)

Arrhythmias

• By mouth

Child 12–18 years usually 50 mg 2–3 times daily; up to 300 mg daily in divided doses if necessary

Metoprolol Tartrate (Non-proprietary) ^(PoM)

Tablets, metoprolol tartrate 50 mg, net price 28 = £1.39, 56 = £1.54; 100 mg, 28 = £1.88, 56 = £2.24. Label: 8

Lospresor[®] (Novartis) ^(PoM)

Tablets, f/c, scored, metoprolol tartrate 50 mg (pink), net price 56-tab pack = £2.57; 100 mg (blue), 56-tab pack = £6.68. Label: 8

▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

SOTALOL HYDROCHLORIDE

Cautions see under Propranolol Hydrochloride; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances; severe or pro-

longed diarrhoea; reduce dose or discontinue if corrected QT interval exceeds 550 msec; **inter-**

◻ SOTALOL HYDROCHLORIDE (continued)

actions: Appendix 1 (beta-blockers), **important:** verapamil interaction see also p. 140

Renal impairment halve normal dose if estimated glomerular filtration rate 30–60 mL/minute/1.73 m²; use one-quarter normal dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Pregnancy see under Propranolol Hydrochloride

Breast-feeding present in milk; possible toxicity due to beta-blockade—monitor infant

CSM advice The use of sotalol should be limited to the treatment of ventricular arrhythmias or prophylaxis of supraventricular arrhythmias (see above). It should no longer be used for angina, hypertension, thyrotoxicosis or for secondary prevention after myocardial infarction; when stopping sotalol for these indications, the dose should be reduced gradually

Contra-indications see under Propranolol Hydrochloride; congenital or acquired long QT syndrome; torsade de pointes

Side-effects see under Propranolol Hydrochloride; arrhythmogenic (pro-arrhythmic) effect (torsade de pointes—increased risk in females)

Licensed use not licensed for use in children under 12 years

Indication and dose

Ventricular arrhythmias, life-threatening ventricular tachyarrhythmia and supraventricular arrhythmias initiated under specialist supervision and ECG monitoring and measurement of corrected QT interval

• By mouth

Neonate initially 1 mg/kg twice daily, increased as necessary every 3–4 days to max. 4 mg/kg twice daily

Atrial flutter, ventricular arrhythmias, life-threatening ventricular tachyarrhythmia and supraventricular arrhythmias initiated under specialist supervision and ECG monitoring and measurement of corrected QT interval

• By mouth

Child 1 month–12 years initially 1 mg/kg twice daily, increased as necessary every 2–3 days to max. 4 mg/kg twice daily (max. 80 mg twice daily)

Child 12–18 years initially 80 mg once daily or 40 mg twice daily, increased gradually at intervals of 2–3 days to usual dose 80–160 mg twice daily; higher doses of 480–640 mg daily for life-threatening ventricular arrhythmias under specialist supervision

Administration tablets may be crushed and dispersed in water

Note Excessive bradycardia can be countered with intravenous injection of atropine sulphate; for **overdosage** see Emergency Treatment of Poisoning, p. 41

Sotalol (Non-proprietary) (POM)

Tablets, sotalol hydrochloride 40 mg, net price 56 = £1.34; 80 mg, 56-tab pack = £1.99; 160 mg, 28-tab pack = £2.21. Label: 8

Beta-Cardone[®] (UCB Pharma) (POM)

Tablets, scored, sotalol hydrochloride 40 mg (green), net price 56-tab pack = £1.34; 80 mg (pink), 56-tab pack = £1.99; 200 mg, 28-tab pack = £2.50. Label: 8

Sotacor[®] (Bristol-Myers Squibb) (POM)

Tablets, scored, sotalol hydrochloride 80 mg, net price 28-tab pack = £3.25; 160 mg, 28-tab pack = £6.41. Label: 8

Injection, sotalol hydrochloride 10 mg/mL, net price 4-mL amp = £1.76

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

2.5 Hypertension

- 2.5.1 Vasodilator antihypertensive drugs and pulmonary hypertension
- 2.5.2 Centrally acting antihypertensive drugs
- 2.5.3 Adrenergic neurone blocking drugs
- 2.5.4 Alpha-adrenoceptor blocking drugs
- 2.5.5 Drugs affecting the renin-angiotensin system

Hypertension in children and adolescents can have a substantial effect on long-term health. Possible causes of hypertension (e.g. congenital heart disease, renal disease and endocrine disorders) and the presence of any complications (e.g. left ventricular hypertrophy) should be established. Treatment should take account of contributory factors and any factors that increase the risk of cardiovascular complications.

Serious hypertension is rare in *neonates* but it can present with signs of congestive heart failure; the cause is often renal and can follow embolic arterial damage.

Children (or their parents or carers) should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include weight reduction (in obese children), reduction of dietary salt, reduction of total and saturated fat,

increasing exercise, increasing fruit and vegetable intake, and smoking cessation (in children who smoke).

Indications for antihypertensive therapy in children include symptomatic hypertension, secondary hypertension, hypertensive target-organ damage, diabetes mellitus, persistent hypertension despite lifestyle measures (see above), and pulmonary hypertension (section 2.5.1.2). The effect of antihypertensive treatment on growth and development is not known; treatment should be started only if benefits are clear.

Antihypertensive therapy should be initiated with a single drug at the lowest recommended dose; the dose can be increased until the target blood pressure is achieved. Once the highest recommended dose is reached, or sooner if the patient begins to experience side-effects, a second drug may be added if blood pressure is not controlled. If more than one drug is required, these should be given as separate products because there is little paediatric experience in using fixed-dose combination products.

Acceptable drug classes for use in children with hypertension include **ACE inhibitors** (section 2.5.5.1), **alpha-blockers** (section 2.5.4), **beta-blockers** (section 2.4), **calcium-channel blockers** (section 2.6.2), and **thiazide diuretics** (section 2.2.1). There is limited information on the use of **angiotensin-II receptor antagonists** (section 2.5.5.2) in children. Diuretics and beta-blockers have a long history of safety and efficacy in children. The newer classes of antihypertensive drugs, including ACE inhibitors and calcium-channel blockers have been shown to be safe and effective in short-term studies in children. Refractory hypertension may require additional treatment with agents such as **minoxidil** (section 2.5.1.1) or **clonidine** (section 2.5.2).

Other measures to reduce cardiovascular risk **Aspirin** (section 2.9) may be used to reduce the risk of cardiovascular events; however, concerns about an increased risk of bleeding and Reye's syndrome need to be considered.

A **statin** can be of benefit in older children who have a high risk of cardiovascular disease and have hypercholesterolaemia (see section 2.12).

Hypertension in diabetes Hypertension can occur in type 2 diabetes and treatment prevents both macrovascular and microvascular complications. ACE inhibitors (section 2.5.5.1) may be considered in children with diabetes and microalbuminaemia or proteinuric renal disease (see also section 6.1.5). Beta-blockers are best avoided in children with, or at a high risk of developing, diabetes, especially when combined with a thiazide diuretic.

Hypertension in renal disease ACE inhibitors may be considered in children with micro-albuminuria or proteinuric renal disease (see also section 6.1.5). High doses of loop diuretics may be required. Specific cautions apply to the use of ACE inhibitors in renal impairment, see section 2.5.5.1, but ACE inhibitors may be effective. Dihydropyridine calcium-channel blockers may be added.

Hypertension in pregnancy High blood pressure in pregnancy may usually be due to pre-existing essential hypertension or to pre-eclampsia. **Methyldopa** (section 2.5.2) is safe in pregnancy. Beta-blockers are effective and safe in the third trimester. Modified-release preparations of **nifedipine** [unlicensed] are also used for hypertension in pregnancy. Intravenous administration of **labetalol** (section 2.4) can be used to control hypertensive crises; alternatively **hydralazine** (section 2.5.1.1) may be used by the intravenous route.

Hypertensive emergencies Hypertensive emergencies in children may be accompanied by signs of hypertensive encephalopathy, including seizures. Controlled reduction in blood pressure over 72–96 hours is essential; rapid reduction can reduce perfusion leading to organ damage. It may be necessary to infuse fluids particularly during the first 12 hours to expand plasma volume should the blood pressure drop too rapidly. Once blood pressure is controlled oral therapy should be started.

Controlled reduction of blood pressure is achieved by **sodium nitroprusside** (section 2.5.1.1). **Esmolol** (section 2.4) is useful for short-term use and has a short duration of action. **Nicardipine** (section 2.6.2) may be administered as a continuous intravenous infusion but it is not licensed for this use. In less severe cases, nifedipine capsules (section 2.6.2) can be used.

In resistant cases, **diazoxide** (section 2.5.1.1) is given intravenously, but it can cause sudden hypotension. Other antihypertensive drugs which may be given intravenously include hydralazine (section 2.5.1.1) and **clonidine** (section 2.5.2).

Hypertension in acute nephritis occurs as a result of sodium and water retention; it should be treated with sodium and fluid restriction, and with furosemide (section 2.2.2); antihypertensive drugs may be added if necessary.

For advice on short-term management of hypertensive episodes in pheochromocytoma, see under Pheochromocytoma, section 2.5.4.

2.5.1 Vasodilator antihypertensive drugs and pulmonary hypertension

2.5.1.1 Vasodilator antihypertensives

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. **Important:** for a warning on the hazards of a very rapid fall in blood pressure, see Hypertensive Emergencies, p. 120.

Sodium nitroprusside is given by intravenous infusion to control severe hypertensive crisis when parenteral treatment is necessary. At low doses it reduces systemic vascular resistance and increases cardiac output; at high doses it can produce profound systemic hypotension—continuous blood pressure monitoring is therefore essential. Sodium nitroprusside may also be used to control paradoxical hypertension after surgery for coarctation of the aorta.

Diazoxide has also been used by intravenous injection in hypertensive emergencies; however it is not first-line therapy.

Hydralazine is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention. The incidence of side-effects is lower if the dose is kept low, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

Minoxidil should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and children develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females.

Prazosin and doxazosin (section 2.5.4) have alpha-blocking and vasodilator properties.

DIAZOXIDE

Cautions during prolonged use monitor white cell and platelet count, and regularly assess growth, bone, and psychological development; **interactions:** Appendix 1 (diazoxide)

Renal impairment dose reduction may be required

Contra-indications

Pregnancy prolonged use may produce alopecia, hypertrichosis, and impaired glucose tolerance in neonate; inhibits uterine activity during labour

Breast-feeding manufacturer advises avoid—no information available

Side-effects tachycardia, hypotension, hyperglycaemia, sodium and water retention; *rarely* cardiomegaly, hyperosmolar non-ketotic coma, leucopenia, thrombocytopenia, and hirsutism

Licensed use intractable hypoglycaemia (section 6.1.4)

Indication and dose

Hypertensive emergencies initiated on specialist advice

• By intravenous injection

Child 1 month–18 years 1–3 mg/kg (max. 150 mg) as a single dose, repeat dose after 5–15 minutes until blood pressure controlled; max. 4 doses in 24 hours

Administration intravenous injection over 30 seconds. Do not dilute

Resistant hypertension

• By mouth

Neonate initially 1.7 mg/kg 3 times daily, adjusted according to response; usual max. 15 mg/kg daily

Child 1 month–18 years initially 1.7 mg/kg 3 times daily, adjusted according to response; usual max. 15 mg/kg daily

Intractable hypoglycaemia section 6.1.4

▢ DIAZOXIDE (continued)

Eudemine® (Goldshield) (POM) 

Injection, diazoxide 15 mg/mL, net price 20-mL amp = £30.00

Tablets, section 6.1.4

▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

HYDRALAZINE HYDROCHLORIDE

Cautions cerebrovascular disease; occasionally blood pressure reduction too rapid even with low parenteral doses; manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose, but evidence of clinical value unsatisfactory; **interactions**: Appendix 1 (hydralazine)

Hepatic impairment reduce dose

Renal impairment reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid before third trimester; no reports of serious harm following use in third trimester

Breast-feeding present in milk but not known to be harmful; monitor infant

Contra-indications idiopathic systemic lupus erythematosus, severe tachycardia, high output heart failure, myocardial insufficiency due to mechanical obstruction, cor pulmonale; acute porphyria (section 9.8.2)

Side-effects tachycardia, palpitation, flushing, hypotension, fluid retention, gastro-intestinal disturbances; headache, dizziness; systemic lupus erythematosus-like syndrome after long-term therapy (especially in slow acetylator individuals); rarely rashes, fever, peripheral neuritis, polyneuritis, paraesthesia, arthralgia, myalgia, increased lacrimation, nasal congestion, dyspnoea, agitation, anxiety, anorexia; blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia), abnormal liver function, jaundice, raised plasma creatinine, proteinuria and haematuria reported

Licensed use not licensed for use in children

Indication and dose

Hypertension

- By mouth

Neonate 250–500 micrograms/kg every 8–12 hours increased as necessary to max. 2–3 mg/kg every 8 hours

Child 1 month–12 years 250–500 micrograms/kg every 8–12 hours increased as necessary to max. 7.5 mg/kg daily (not exceeding 200 mg daily)

Child 12–18 years 25 mg twice daily, increased to usual max. 50–100 mg twice daily

- By slow intravenous injection

Neonate 100–500 micrograms/kg repeated every 4–6 hours as necessary; max 3 mg/kg daily

Child 1 month–12 years 100–500 micrograms/kg repeated every 4–6 hours as necessary; max 3 mg/kg daily (not exceeding 60 mg daily)

Child 12–18 years 5–10 mg repeated every 4–6 hours as necessary

- By continuous intravenous infusion (preferred route in cardiac patients)

Neonate 12.5–50 micrograms/kg/hour

Child 1 month–12 years 12.5–50 micrograms/kg/hour; max. 3 mg/kg daily

Child 12–18 years initially 3–9 mg/hour; max. 3 mg/kg daily

Administration For *intravenous injection* initially reconstitute 20 mg with 1 mL water for injections, then dilute to a concentration of 0.5–1 mg/mL with sodium chloride 0.9% intravenous infusion and administer over 5–20 minutes. For administration *by mouth* diluted injection may be given orally. For *continuous intravenous infusion* initially reconstitute 20 mg with 1 mL water for injections, then dilute with sodium chloride 0.9% or Ringer's solution. Incompatible with glucose intravenous infusion

Hydralazine (Non-proprietary) (POM)

Tablets, hydralazine hydrochloride 25 mg, net price 56 = £11.79; 50 mg, 56 = £18.54

Apresoline® (Amdipharm) (POM)

Tablets, yellow, s/c, hydralazine hydrochloride 25 mg, net price 84-tab pack = £2.82

Excipients include gluten

Injection, powder for reconstitution, hydralazine hydrochloride, net price 20-mg amp = £1.84

▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

MINOXIDIL

Cautions see notes above; acute porphyria (section 9.8.2); **interactions**: Appendix 1 (vasodilator antihypertensives)

Renal impairment use with caution in significant impairment

Pregnancy neonatal hirsutism reported

Breast-feeding present in milk but not known to be harmful

Contra-indications phaeochromocytoma

Side-effects sodium and water retention; weight gain, peripheral oedema, tachycardia, hypertri-chosis; reversible rise in creatinine and blood

▮ MINOXIDIL (continued)

urea nitrogen; occasionally, gastro-intestinal disturbances, breast tenderness, rashes

Indication and dose

Severe hypertension

• By mouth

Child 1 month–12 years initially 200 micrograms/kg daily in 1–2 divided doses, increased in steps of 100–200 micrograms/kg daily at intervals of at least 3 days; max. 1 mg/kg daily

Child 12–18 years initially 5 mg daily in 1–2 divided doses increased in steps of 5–10 mg at

intervals of at least 3 days; max. 100 mg daily (seldom necessary to exceed 50 mg daily)

Loniten® (Pharmacia) (P_M)

Tablets, scored, minoxidil 2.5 mg, net price 60-tab pack = £8.88; 5 mg, 60-tab pack = £15.83; 10 mg, 60-tab pack = £30.68

▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

SODIUM NITROPRUSSIDE

Cautions hypothyroidism, hyponatraemia, impaired cerebral circulation, hypothermia; monitor blood pressure and blood-cyanide concentration, and if treatment exceeds 3 days also blood-thiocyanate concentration; avoid sudden withdrawal—terminate infusion over 15–30 minutes; **interactions:** Appendix 1 (nitroprusside)

Hepatic impairment avoid in severe liver impairment

Renal impairment cyanide or thiocyanate metabolites may accumulate—avoid prolonged use

Pregnancy potential for accumulation of cyanide in fetus—avoid prolonged use

Breast-feeding no information available; caution advised due to thiocyanate metabolite

Contra-indications severe vitamin B₁₂ deficiency; Leber's optic atrophy; compensatory hypertension

Side-effects associated with over rapid reduction in blood pressure (reduce infusion rate): headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort; occasionally reduced platelet count, acute transient phlebitis

Cyanide Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia,

sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see p. 44)

Licensed use not licensed for use in the UK

Indication and dose

Hypertensive emergencies

• By continuous infusion

Neonate 500 nanograms/kg/minute then increased in steps of 200 nanograms/kg/minute as necessary to max. 8 micrograms/kg/minute (max. 4 micrograms/kg/minute if used for longer than 24 hours)

Child 1 month–18 years 500 nanograms/kg/minute then increased in steps of 200 nanograms/kg/minute as necessary to max. 8 micrograms/kg/minute (max. 4 micrograms/kg/minute if used for longer than 24 hours)

Administration For *continuous intravenous infusion* in glucose 5%, infuse *via* infusion device to allow precise control; protect infusion from light. For further details, consult product literature

Sodium Nitroprusside (Non-proprietary) (P_M)

Intravenous infusion, powder for reconstitution, sodium nitroprusside 10 mg/mL. For dilution and use as an infusion. Available from 'special-order' manufacturers or specialist importing companies, see p. 943

2.5.1.2 Pulmonary hypertension

Only pulmonary *arterial* hypertension is currently suitable for drug treatment. Pulmonary arterial hypertension includes persistent pulmonary hypertension of the newborn, idiopathic pulmonary arterial hypertension in children, and pulmonary hypertension related to congenital heart disease and cardiac surgery.

Some types of pulmonary hypertension are treated with vasodilator antihypertensive therapy and oxygen. Diuretics (section 2.2) may also have a role in children with right-sided heart failure.

Initial treatment of *persistent pulmonary hypertension of the newborn* involves the administration of **nitric oxide**; **epoprostenol** can be used until nitric oxide is available. Oral sildenafil may be helpful in less severe cases. Epoprostenol and sildenafil can cause profound systemic hypotension. In rare circumstances either **tolazoline** or **magnesium sulphate** can be given by intravenous infusion when nitric oxide and epoprostenol have failed.

Treatment of *idiopathic pulmonary arterial hypertension* is determined by acute vasodilator testing; drugs used for treatment include calcium-channel blockers (usually **nifedipine**, section 2.6.2), long-term intravenous **epoprostenol**, nebulised **iloprost**, **bosentan**, or **sildenafil**. Anticoagulation (usually with warfarin) may also be required to prevent secondary thrombosis.

Inhaled nitric oxide is a potent and selective pulmonary vasodilator. It acts on cyclic guanosine monophosphate (cGMP) resulting in smooth muscle relaxation. Inhaled nitric oxide is used in the treatment of persistent pulmonary hypertension of the newborn, and may also be useful in other forms of arterial pulmonary hypertension. Dependency can occur with high doses and prolonged use; to avoid rebound pulmonary hypertension the drug should be withdrawn gradually, often with the aid of sildenafil.

Excess nitric oxide can cause methaemoglobinaemia; therefore, methaemoglobin concentration should be measured regularly, particularly in neonates.

Nitric oxide increases the risk of haemorrhage by inhibiting platelet aggregation, but it does not usually cause bleeding.

Epoprostenol (prostacyclin) is a prostaglandin and a potent vasodilator. It is used in the treatment of persistent pulmonary hypertension of the newborn, idiopathic pulmonary arterial hypertension, and in the acute phase following cardiac surgery. It is given by continuous 24-hour intravenous infusion.

Epoprostenol is a powerful inhibitor of platelet aggregation and there is a possible risk of haemorrhage. It is sometimes used as an antiplatelet in renal dialysis either alone or with heparin (see section 2.8.1). It can also cause serious systemic hypotension and, if withdrawn suddenly, can cause pulmonary hypertensive crisis.

Children on prolonged treatment can become tolerant to epoprostenol, and therefore require an increase in dose.

Iloprost is a synthetic analogue of epoprostenol and is efficacious when nebulised in adults with pulmonary arterial hypertension, but experience in children is limited. It is more stable than epoprostenol and has a longer half-life.

Bosentan is a dual endothelin receptor antagonist used orally in the treatment of idiopathic pulmonary arterial hypertension. The concentration of endothelin, a potent vasoconstrictor, is raised in sustained pulmonary hypertension.

Sildenafil, a vasodilator developed for the treatment of erectile dysfunction, is also used for pulmonary arterial hypertension. It is used either alone or as an adjunct to other drugs and has relatively few side-effects.

Sildenafil is a selective phosphodiesterase type-5 inhibitor. Inhibition of this enzyme in the lungs enhances the vasodilatory effects of nitric oxide and promotes relaxation of vascular smooth muscle.

Sildenafil has also been used in pulmonary hypertension for weaning children off inhaled nitric oxide following cardiac surgery, and less successfully in idiopathic pulmonary arterial hypertension.

Tolazoline is now rarely used to correct pulmonary artery vasospasm in pulmonary hypertension of the newborn as better alternatives are available (see above). Tolazoline is an alpha-blocker and produces both pulmonary and systemic vasodilation.

BOSENTAN

Cautions not to be initiated if systemic systolic blood pressure is below 85 mmHg; monitor liver function before and at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment (see Contra-indications below); monitor haemoglobin before and during treatment (monthly for first 4 months, then 3-monthly thereafter), withdraw treatment gradually; **interactions:** Appendix 1 (bosentan)

Contra-indications acute porphyria (section 9.8.2)

Hepatic impairment avoid in moderate and severe hepatic impairment

Pregnancy avoid (teratogenic in *animal* studies); effective contraception required during and for at least 3 months after administration (hormonal

contraception not considered effective); monthly pregnancy tests advised

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disturbances, dry mouth, rectal haemorrhage, hepatic impairment (see Cautions, above); flushing, hypotension, palpitation, oedema, chest pain; dyspnoea; headache, dizziness, fatigue; back pain and pain in extremities; anaemia; hypersensitivity reactions (including rash, pruritus, and anaphylaxis)

Licensed use not licensed for use in children under 12 years

□ BOSENTAN (continued)

Indication and dose

Idiopathic pulmonary arterial hypertension

- By mouth

Child 3–18 years and body-weight 10–20 kg initially 31.25 mg once daily increased after 4 weeks to 31.25 mg twice daily

Child 3–18 years and body-weight 20–40 kg initially 31.25 mg twice daily increased after 4 weeks to 62.5 mg twice daily

Child 12–18 years and body-weight over 40 kg initially 62.5 mg twice daily increased after 4

weeks to 125 mg twice daily; max. 250 mg twice daily

Administration Tablets may be cut, or suspended in water or non-acidic liquid. Suspension is stable at room-temperature (max. 25°C) for 24 hours

Tracleer® (Actelion) ▼ (PoM)

Tablets, f/c, orange, bosentan (as monohydrate) 62.5 mg, net price 56-tab pack = £1541.00; 125 mg, 56-tab pack = £1541.00

EPOPROSTENOL

Cautions anticoagulant monitoring required when given with heparin; haemorrhagic diathesis; avoid abrupt withdrawal (see notes above); monitor blood pressure; concomitant use of drugs that increase risk of bleeding

Pregnancy manufacturer advises use with caution—no information available

Contra-indications severe left ventricular dysfunction; pulmonary veno-occlusive disease

Side-effects see notes above; gastro-intestinal disturbances, hypotension, bradycardia, tachycardia, pallor, flushing, sweating with higher doses; headache; lassitude, anxiety, agitation; dry mouth, jaw pain, chest pain; also reported, hyperglycaemia and injection-site reactions

Licensed use not licensed for use in children

Indication and dose

Persistent pulmonary hypertension of the newborn

- By continuous intravenous infusion

Neonate initially 2 nanograms/kg/minute adjusted according to response; usual max. 20 nanograms/kg/minute (rarely up to 40 nanograms/kg/minute)

Idiopathic pulmonary arterial hypertension

- By continuous intravenous infusion

Child 1 month–18 years initially 2 nanograms/kg/minute increased as necessary to 40 nanograms/kg/minute

Administration consult product literature

Flolan® (GSK) (PoM)

Infusion, powder for reconstitution, epoprostenol (as sodium salt), net price 500-microgram vial (with diluent) = £64.57; 1.5-mg vial (▼) (with diluent) = £130.07

ILOPROST

Cautions unstable pulmonary hypertension with advanced right heart failure; hypotension (do not initiate if systolic blood pressure below 85 mmHg); acute pulmonary infection; severe asthma; **interactions:** Appendix 1 (iloprost)

Hepatic impairment dose may need to be halved in liver cirrhosis—initially 2.5 micrograms at intervals of at least 3 hours (max. 6 times daily), adjusted according to response

Contra-indications decompensated cardiac failure (unless under medical supervision); severe coronary heart disease; severe arrhythmias; congenital or acquired valvular defects of the myocardium; pulmonary veno-occlusive disease; conditions which increase risk of haemorrhage

Pregnancy manufacturer advises avoid (toxicity in animal studies); effective contraception must be used during treatment

Breast-feeding manufacturer advises avoid—no information available

Side-effects vasodilatation, hypotension, syncope, cough, headache, throat or jaw pain; nausea, vomiting, diarrhoea, chest pain, dys-

pnoea, bronchospasm, and wheezing also reported

Licensed use not licensed for use in children under 18 years

Indication and dose

Idiopathic or familial pulmonary arterial hypertension

- By inhalation of nebulised solution

Child 8–18 years initial dose 2.5 micrograms increased to 5 micrograms for second dose, if tolerated maintain at 5 micrograms 6–9 times daily according to response; reduce to 2.5 micrograms 6–9 times daily if higher dose not tolerated

Raynaud's syndrome section 2.6.4.1

Ventavis® (Schering Health) ▼ (PoM)

Nebuliser solution, iloprost (as trometamol) 10 micrograms/mL, net price 30 × 1-mL (10 microgram) unit-dose vials = £425.00, 168 × 1-mL = £2377.20. For use with *Prodose*® (JMS) or *Venta-Neb*® (JMS) nebuliser

MAGNESIUM SULPHATE

Cautions see section 9.5.1.3

Side-effects see section 9.5.1.3

Licensed use see section 9.5.1.3

Indication and dose

Persistent pulmonary hypertension of the newborn

- By intravenous infusion

Neonate initially 200 mg/kg over 20–30 minutes; if response occurs, then by continuous intravenous infusion of 20–75 mg/kg/hour to maintain plasma-magnesium concentration between 3.5–5.5 mmol/litre, given for up to 5 days

Neonatal hypocalcaemia see section 9.5.1.3

Hypomagnesaemia see section 9.5.1.3

Administration For *intravenous infusion* dilute with glucose 5% or sodium chloride 0.9% intravenous infusion to a max. concentration of 100 mg/mL (200 mg/mL if fluid restricted)

Magnesium Sulphate (Non-proprietary) ^(POM)

Injection, magnesium sulphate 50% (Mg²⁺ approx. 2 mmol/mL), net price 2-mL (1-g) amp = £3.80, 5-mL (2.5-g) amp = £3.00, 10-mL (5-g) amp = £3.35; prefilled 10-mL (5-g) syringe = £4.95

SILDENAFIL

Cautions hypotension (avoid if severe); intravascular volume depletion; left ventricular outflow obstruction; autonomic dysfunction; avoid abrupt withdrawal; other cardiovascular disease; pulmonary veno-occlusive disease; predisposition to priapism; anatomical deformation of the penis; bleeding disorders or active peptic ulceration; ocular disorders; initiate cautiously if child also on epoprostenol, iloprost, bosentan or nitric oxide; **interactions:** Appendix 1 (sildenafil)

Hepatic impairment reduce dose if not tolerated in mild to moderate impairment; manufacturer advises avoid in severe impairment

Renal impairment reduce dose if not tolerated

Contra-indications recent history of stroke; history of non-arteritic anterior ischaemic optic neuropathy; hereditary degenerative retinal disorders; avoid concomitant use of nitrates

Side-effects gastro-intestinal disturbances, dry mouth; flushing, oedema; bronchitis, cough; headache, migraine, night sweats, paraesthesia, insomnia, anxiety, tremor, vertigo; fever, influenza-like symptoms; anaemia; back and limb pain, myalgia; visual disturbances, retinal haemorrhage, photophobia, painful red eyes; nasal congestion, epistaxis; cellulitis, alopecia; *less commonly* gynaecomastia, priapism; *also reported* rash, retinal vascular occlusion, non-arteritic anterior ischaemic optic neuropathy (discontinue if sudden visual impairment occurs), and sudden hearing loss (advise patient to seek medical help)

Licensed use not licensed for use in children under 18 years

Indication and dose

Pulmonary hypertension after cardiac surgery, weaning from nitric oxide, idiopathic pulmonary arterial hypertension, persistent pulmonary hypertension of the newborn

- By mouth

Neonate initially 250–500 micrograms/kg every 4–8 hours, adjusted according to response; max. 2 mg/kg every 4 hours; start with lower dose and frequency especially if used with other vasodilators (see Cautions above); withdraw gradually

Child 1 month– 18 years initially 250–500 micrograms/kg every 4–8 hours, adjusted according to response; max. 2 mg/kg every 4 hours; start with lower dose and frequency especially if used with other vasodilators (see Cautions above)

Administration tablet may be dissolved in water or blackcurrant drink and given by mouth or through a nasogastric tube

Viagra[®] (Pfizer) ^(POM) ^(JMS)

Tablets, all blue, f/c, sildenafil (as citrate), 25 mg, net price 4-tab pack = £16.59, 8-tab pack = £33.19; 50 mg, 4-tab pack = £19.34, 8-tab pack = £38.67; 100 mg, 4-tab pack = £23.50, 8-tab pack = £46.99

Revatio[®] (Pfizer) ^(POM)

Tablets, f/c, sildenafil (as citrate), 20 mg, net price 90-tab pack = £373.50

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

TOLAZOLINE

Cautions mitral stenosis; cardiotoxic accumulation may occur with continuous infusion, particularly in renal impairment—monitor blood pressure regularly for sustained systemic hypotension; **interactions:** Appendix 1 (alpha-blockers)

Renal impairment accumulates in renal impairment; risk of cardiotoxicity; lower doses may be necessary

Contra-indications peptic ulcer disease

Side-effects nausea, vomiting, diarrhoea, epigastric pain; flushing, tachycardia, cardiac arrhythmias; headache, shivering, sweating; oliguria, metabolic alkalosis, haematuria, blood dyscrasias (including thrombocytopenia); blotchy skin; at high doses severe hypotension, marked hypertension, renal failure, and haemorrhage reported

Licensed use not licensed for use in children

□ TOLAZOLINE (continued)

Indication and dose

Correction of pulmonary vasospasm in neonates

- By intravenous injection and continuous intravenous infusion (maintenance)

Neonate initially 1 mg/kg by intravenous injection over 2–5 minutes, followed if necessary by continuous intravenous infusion of 200 micrograms/kg/hour with careful blood pressure monitoring; doses above 300 micrograms/kg/hour associated with cardiotoxicity and renal failure

- By endotracheal administration

Neonate 200 micrograms/kg

Administration For continuous intravenous infusion dilute with glucose 5% or sodium chloride 0.9% intravenous infusion. Prepare a fresh solution every 24 hours.

For endotracheal administration dilute with 0.5–1 mL of sodium chloride 0.9% solution for injection

Tolazoline (Non-proprietary)

Injection, tolazoline 25 mg/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 943

2.5.2 Centrally acting antihypertensive drugs

Methyldopa, a centrally acting antihypertensive, is of little value in the management of refractory sustained hypertension in infants and children. On prolonged use it is associated with fluid retention (which may be alleviated by concomitant use of diuretics).

Methyldopa is effective for the management of hypertension in pregnancy.

Clonidine is also a centrally acting antihypertensive but has the disadvantage that sudden withdrawal may cause a hypertensive crisis. Clonidine is also used under specialist supervision for pain management, sedation, and opioid withdrawal, attention deficit hyperactivity disorder, and Tourette syndrome.

CLONIDINE HYDROCHLORIDE

Cautions must be withdrawn gradually to avoid hypertensive crisis; Raynaud's syndrome or other occlusive peripheral vascular disease; history of depression; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (clonidine)

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

Pregnancy may lower fetal heart rate, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension; avoid intravenous injection

Breast-feeding present in milk—manufacturer advises avoid

Side-effects dry mouth, sedation, depression, fluid retention, bradycardia, Raynaud's phenomenon, headache, dizziness, euphoria, nocturnal unrest, rash, nausea, constipation, rarely impotence

Licensed use not licensed for use in children

Indication and dose

Severe hypertension

- By mouth

Child 2–18 years initially 0.5–1 microgram/kg 3 times daily, increased gradually if necessary;

max. 25 micrograms/kg daily in divided doses (not exceeding 1.2 mg daily)

- By slow intravenous injection

Child 2–18 years 2–6 micrograms/kg (max. 300 micrograms) as a single dose

Administration For intravenous injection give over 10–15 minutes; compatible with sodium chloride 0.9% or glucose 5% intravenous infusion.

For administration by mouth tablets may be crushed and dissolved in water

Catapres® (Boehringer Ingelheim) (POM) 

Tablets, scored, clonidine hydrochloride 100 micrograms, net price 100-tab pack = £5.60; 300 micrograms, 100-tab pack = £13.04. Label: 3, 8

Injection, clonidine hydrochloride 150 micrograms/mL, net price 1-mL amp = 29p

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

METHYLDOPA

Cautions withdraw treatment gradually; monitor blood counts and liver-function before treatment and at intervals during first 6–12 weeks or if

unexplained fever occurs; history of depression; positive direct Coombs' test in up to 20% of patients (may affect blood cross-matching); inter-

▢ METHYLDOPA (continued)

ference with laboratory tests; **interactions:**

Appendix 1 (methyldopa)

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

Hepatic impairment manufacturer advises caution in history of liver disease; avoid in active liver disease

Renal impairment start with small dose; increased sensitivity to hypotensive and sedative effect

Pregnancy not known to be harmful

Breast-feeding amount too small to be harmful

Contra-indications depression, active liver disease, phaeochromocytoma; acute porphyria (section 9.8.2)

Side-effects gastro-intestinal disturbances, dry mouth, stomatitis, sialadenitis; bradycardia, postural hypotension, oedema; sedation, headache, dizziness, asthenia, myalgia, arthralgia, paraesthesia, nightmares, mild psychosis, depression, impaired mental acuity, parkinsonism, Bell's palsy; hepatitis, jaundice; pancreatitis; haemolytic anaemia; bone-marrow depression, leucopenia, thrombocytopenia, eosinophilia; hypersensitivity reactions including lupus erythematosus-like syndrome, drug fever, myocarditis, pericarditis; rashes (including toxic epi-

dermal necrolysis); nasal congestion, failure of ejaculation, impotence, decreased libido, gynaecomastia, hyperprolactinaemia, amenorrhoea

Indication and dose

Refractory hypertension (but see notes above)

• By mouth

Child 1 month–12 years initially 2.5 mg/kg 3 times daily, increased as necessary at intervals of at least 2 days to max. 65 mg/kg daily (not exceeding 3 g daily)

Child 12–18 years initially 250 mg 2–3 times daily increased as necessary at intervals of at least 2 days to max. 3 g daily

Methyldopa (Non-proprietary) ^(POM)

Tablets, coated, methyldopa (anhydrous) 125 mg, net price 56 tab pack = £13.60; 250 mg, 56 tab pack = £8.36; 500 mg, 56 tab pack = £12.78. Label: 3, 8

Aldomet® (MSD) ^(POM)

Tablets, yellow, f/c, methyldopa (anhydrous) 250 mg, net price 60 = £1.88; 500 mg, 30 = £1.90. Label: 3, 8

▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

2.5.3 Adrenergic neurone blocking drugs

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use in adults and are rarely used in children.

2.5.4 Alpha-adrenoceptor blocking drugs

Doxazosin and **prazosin** have post-synaptic alpha-blocking and vasodilator properties and rarely cause tachycardia. They can, however, reduce blood pressure rapidly after the first dose and should be introduced with caution.

Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension.

DOXAZOSIN

Cautions care with initial dose (postural hypotension); cataract surgery (risk of intra-operative floppy iris syndrome); susceptibility to heart failure; **interactions:** Appendix 1 (alpha-blockers)
Driving May affect performance of skilled tasks e.g. driving

Hepatic impairment no information available—manufacturer advises caution

Pregnancy no evidence of teratogenicity, manufacturer advises use only when potential benefit outweighs risk

Breast-feeding accumulates in milk in *animal* studies—manufacturer advises avoid

Side-effects gastro-intestinal disturbances; oedema, hypotension, postural hypotension; dyspnoea, rhinitis, coughing; asthenia, fatigue, vertigo, dizziness, headache, paraesthesia, sleep disturbance, anxiety, depression; respiratory-tract infection, urinary-tract infection, influenza-like symptoms; back pain, myalgia; *less commonly* weight changes, flushing, hypoaesthesia, syn-

cope, tremor, agitation, micturition disturbances, impotence, epistaxis, arthralgia, tinnitus, hypersensitivity reactions (including pruritus, purpura, rash), alopecia; *very rarely* cholestasis, hepatitis, jaundice, bronchospasm, gynaecomastia, priapism, abnormal ejaculation, leucopenia, thrombocytopenia, blurred vision

Licensed use not licensed for use in children

Indication and dose

Hypertension (see notes above)

• By mouth

Child 6–12 years 500 micrograms once daily, increased at 1-week intervals to 2–4 mg daily

Child 12–18 years 1 mg daily, increased after 1–2 weeks to 2 mg once daily, and thereafter to 4 mg once daily if necessary; usual max. 4 mg daily (rarely up to 16 mg daily may be required)

Dysfunctional voiding section 7.4.1

◊ DOXAZOSIN (continued)

Doxazosin (Non-proprietary) (POM)

Tablets, doxazosin (as mesilate) 1 mg, net price 28-tab pack = 93p; 2 mg, 28-tab pack = 97p; 4 mg, 28-tab pack = £1.42. Counselling, driving
Brands include *Doxadura*[®]

Cardura[®] (Pfizer) (POM)

Tablets, doxazosin (as mesilate) 1 mg, net price 28-tab pack = £10.56; 2 mg, 28-tab pack = £14.08. Counselling, driving

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

▲ Modified-release

Note Children stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin

Doxazosin (Non-proprietary) (POM)

Tablets, m/r, doxazosin (as mesilate) 4 mg, net price 28-tab pack = £6.33. Label: 25, counselling, driving
Brands include *Doxadura*[®] XL, *Slocinx*[®] XL

Cardura[®] XL (Pfizer) (POM)

Tablets, m/r, doxazosin (as mesilate) 4 mg, net price 28-tab pack = £6.33; 8 mg, 28-tab pack = £12.67. Label: 25, counselling, driving

PRAZOSIN

Cautions first dose may cause collapse due to hypotension (therefore should be taken on retiring to bed); **interactions:** Appendix 1 (alpha-blockers)

Hepatic impairment start with low doses and adjust according to response

Renal impairment start with low doses in moderate to severe impairment; increase with caution

Pregnancy no evidence of teratogenicity; manufacturer advises use only when potential benefit outweighs risk

Breast-feeding present in milk; manufacturer advises use with caution

Contra-indications not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)

Side-effects gastro-intestinal disturbances; postural hypotension, oedema, palpitation; dyspnoea, nasal congestion; drowsiness, headache, depression, nervousness, vertigo; urinary frequency; weakness; blurred vision; *less commonly* tachycardia, insomnia, paraesthesia, sweating, impotence, arthralgia, eye disorders, tinnitus, epistaxis, allergic reactions including rash, pruritus, and urticaria; *rarely* pancreatitis, flushing, vasculitis, bradycardia, hallucinations, worsening of narcolepsy, gynaecomastia, priapism, urinary incontinence, and alopecia

Licensed use not licensed for use in children under 12 years

Indication and dose

Hypertension (see notes above)

• By mouth

Child 1 month–12 years 10–15 micrograms/kg 2–4 times daily (initial dose at bedtime) increa-

sed gradually to max. 500 micrograms/kg daily in divided doses (not exceeding 20 mg daily)

Child 12–18 years 500 micrograms 2–3 times daily (initial dose at bedtime), increased after 3–7 days to 1 mg 2–3 times daily for a further 3–7 days; further increased gradually if necessary to max. 20 mg daily in divided doses

Congestive heart failure (but rarely used, see section 2.2)

• By mouth

Child 1 month–12 years 5 micrograms/kg twice daily (initial dose at bedtime), increased gradually to max. 100 micrograms/kg daily in divided doses

Child 12–18 years 500 micrograms 2–4 times daily (initial dose at bedtime), increasing to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

Administration For oral administration tablets may be dispersed in water

Prazosin (Non-proprietary) (POM)

Tablets, prazosin (as hydrochloride) 500 micrograms, net price 56-tab pack = £2.51; 1 mg, 56-tab pack = £3.23; 2 mg, 56-tab pack = £4.39; 5 mg, 56-tab pack = £8.75. Label: 3, counselling, initial dose

Hypovase[®] (Pfizer) (POM)

Tablets, prazosin (as hydrochloride) 500 micrograms, net price 60-tab pack = £2.69; 1 mg, scored, 60-tab pack = £3.46. Label: 3, counselling, initial dose

Phaeochromocytoma

Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors. Alpha-blockers are used in the short-term management of hypertensive episodes in phaeochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker (section 2.4); a cardioselective beta-blocker is preferred. There is no nationwide

consensus on the optimal drug regimen or doses used for the management of phaeochromocytoma.

Phenoxybenzamine, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects. Phenoxybenzamine has also been used to treat severe shock in the presence of adequate circulating blood volume, and to lower systemic vascular resistance after cardiac surgery.

PHENOXYBENZAMINE HYDROCHLORIDE

Cautions congestive heart failure; severe heart disease (see also Contra-indications); cerebrovascular disease (avoid if history of cerebrovascular accident); carcinogenic in *animals*; avoid in acute porphyria (section 9.8.2); avoid infusion in hypovolaemia; avoid extravasation (irritant to tissues); avoid contact with skin (risk of contact sensitisation)

Renal impairment use with caution

Pregnancy hypotension in newborn may occur—use with caution

Breast-feeding may be present in milk

Contra-indications history of cerebrovascular accident

Side-effects postural hypotension with dizziness and marked compensatory tachycardia, lassitude, nasal congestion, miosis, inhibition of ejaculation; rarely gastro-intestinal disturbances; decreased sweating and dry mouth after intravenous infusion; idiosyncratic profound hypotension within few minutes of starting infusion

Licensed use not licensed for use in children

Indication and dose

Hypertension in phaeochromocytoma

• By mouth

Child 1 month–18 years 0.5–1 mg/kg twice daily adjusted according to response

• By intravenous infusion

Child 1 month–18 years 0.5–1 mg/kg daily adjusted according to response; occasionally up to 2 mg/kg daily may be required; do not repeat dose within 24 hours

Severe shock following cardiac surgery

• By intravenous infusion

Child 1 month–18 years initially 1 mg/kg then if necessary 500 micrograms/kg every 8–12 hours adjusted according to response

Administration for administration by *mouth*, capsules may be opened; for *intravenous infusion*, dilute with Sodium Chloride 0.9% and give over at least 2 hours; max. 4 hours between dilution and completion of infusion

Phenoxybenzamine (Goldshield) (POM)

Injection concentrate, phenoxybenzamine hydrochloride 50 mg/mL. To be diluted before use. Net price 2-mL amp = £57.14 (hosp. only)

Dibenyline® (Goldshield) (POM)

Capsules, red/white, phenoxybenzamine hydrochloride 10 mg. Net price 30-cap pack = £10.84
Note May be difficult to obtain

2.5.5 Drugs affecting the renin-angiotensin system

2.5.5.1 Angiotensin-converting enzyme inhibitors

2.5.5.2 Angiotensin-II receptor antagonists

2.5.5.1 Angiotensin-converting enzyme inhibitors

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. The main indications of ACE inhibitors in children are shown below. In infants and young children, captopril is often considered first.

Initiation under specialist supervision Treatment with ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in children.

Heart failure ACE inhibitors have a valuable role in all grades of heart failure, usually combined with a loop diuretic (section 2.2). Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. In adults, a low dose of spironolactone may be beneficial in severe heart failure and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Profound first-dose hypotension can occur when ACE inhibitors are introduced to children with heart failure who are already taking a high dose of a loop diuretic (see Cautions below). Temporary withdrawal of the loop diuretic reduces the risk, but can cause severe rebound pulmonary oedema.

Hypertension ACE inhibitors may be considered for hypertension when thiazides and beta-blockers are contra-indicated, not tolerated, or fail to control blood pressure; they may be considered for hypertension in children with type 1 diabetes with nephropathy (see also section 6.1.5). ACE inhibitors can reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy (see Cautions, below); the first dose should preferably be given at bedtime.

Diabetic nephropathy For comment on the role of ACE inhibitors in the management of diabetic nephropathy, see section 6.1.5.

Renal effects Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below are present). Hyperkalaemia and other side-effects of ACE inhibitors are more common in children with impaired renal function and the dose may need to be reduced (see under individual drugs).

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In children with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore contra-indicated in children known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in children with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in those with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If they are used in these circumstances renal function needs to be monitored.

ACE inhibitors should also be used with particular caution in children who may have undiagnosed and clinically silent renovascular disease. ACE inhibitors are useful for the management of hypertension and proteinuria in children with nephritis. They are thought to have a beneficial effect by reducing intra-glomerular hypertension and protecting the glomerular capillaries and membrane.

Cautions ACE inhibitors need to be initiated with care in children receiving diuretics (**important:** see Concomitant diuretics, below); first doses can cause hypotension especially in children taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated or with heart failure (see above). Discontinue if marked elevation of hepatic enzymes or jaundice (risk of hepatic necrosis). Renal function should be monitored before and during treatment, and the dose reduced in renal impairment (see also above and under individual drugs). For use in known renovascular disease, see Renal Effects above. The risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended). ACE inhibitors should be used with care in children with severe or symptomatic aortic stenosis (risk of hypotension) and in hypertrophic cardiomyopathy. They should be used with care (or avoided) in those with a history of idiopathic or hereditary angioedema. Children with primary aldosteronism and Afro-Caribbean children may respond less well to ACE inhibitors. **Interactions:** Appendix 1 (ACE inhibitors).

Anaphylactoid reactions To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polyacrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulphate; they should also be withheld before desensitisation with wasp or bee venom.

Concomitant diuretics ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted children; treatment should therefore be initiated with very low doses. In some children the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

Contra-indications ACE inhibitors are contra-indicated in children with hypersensitivity to ACE inhibitors (including angioedema) and in bilateral renovascular disease (see also above). ACE inhibitors should not be used in pregnancy unless essential—they may adversely affect fetal and neonatal blood pressure control and renal function, and possibly cause skull defects and oligohydramnios; toxicity in *animal* studies has been reported.

Side-effects ACE inhibitors can cause profound hypotension (see Cautions), renal impairment (see Renal effects above), and a persistent dry cough. They can also cause angioedema (onset may be delayed; higher incidence reported in Afro-Caribbean patients), rash (which may be associated with pruritus and urticaria), pancreatitis, and upper respiratory-tract symptoms such as sinusitis, rhinitis, and sore throat. Gastro-intestinal effects reported with ACE inhibitors include nausea, vomiting, dyspepsia, diarrhoea, constipation, and abdominal pain. Altered liver function tests, cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure have been reported—discontinue if marked elevation of hepatic enzymes or jaundice. Hyperkalaemia, hypoglycaemia and blood disorders including thrombocytopenia, leucopenia, neutropenia, and haemolytic anaemia have also been reported. Other reported side-effects include headache, dizziness, fatigue, malaise, taste disturbance, paraesthesia, bronchospasm, fever, serositis, vasculitis, myalgia, arthralgia, positive antinuclear antibody, raised erythrocyte sedimentation rate, eosinophilia, leucocytosis, and photosensitivity.

Neonates The neonatal response to treatment with ACE inhibitors is very variable, and some neonates develop profound hypotension with even small doses; a test-dose should be used initially and increased cautiously. Adverse effects such as apnoea, seizures, renal failure, and severe unpredictable hypotension are very common in the first month of life and it is therefore recommended that ACE inhibitors are avoided whenever possible, particularly in preterm neonates.

CAPTOPRIL

Cautions see notes above; acute porphyria (section 9.8.2)

Renal impairment see notes above; start with low dose and adjust according to response

Breast-feeding avoid in first few weeks after delivery—risk of profound neonatal hypotension; can be used in older infant if essential but monitor infant's blood pressure

Contra-indications see notes above

Pregnancy avoid unless essential (see notes above)

Side-effects see notes above; tachycardia, serum sickness, weight loss, stomatitis, maculopapular rash, photosensitivity, flushing and acidosis

Licensed use not licensed for use in children under 18 years

Indication and dose

Hypertension, heart failure, proteinuria in nephritis (under specialist supervision)

• By mouth

Neonate (caution, see neonatal information above) test dose, 10–50 micrograms/kg (10 micrograms/kg in neonate less than 37 weeks post-menstrual age), monitor blood pressure carefully for 1–2 hours; if tolerated give 10–50 micrograms/kg 2–3 times daily increased as necessary to max. 2 mg/kg daily in divided doses (max. 300 micrograms/kg daily in divided doses in neonate less than 37 weeks post-menstrual age)

Child 1 month–12 years test dose, 100 micrograms/kg (max. 6.25 mg), monitor blood

pressure carefully for 1–2 hours; if tolerated give 100–300 micrograms/kg 2–3 times a day, increased as necessary to max. 6 mg/kg daily in divided doses (max. 4 mg/kg daily in divided doses for child 1 month–1 year)

Child 12–18 years test dose, 100 micrograms/kg or 6.25 mg, monitor blood pressure carefully for 1–2 hours; if tolerated give 12.5–25 mg 2–3 times a day, increased as necessary to max. 150 mg daily in divided doses

Diabetic nephropathy (under specialist supervision)

• By mouth

Child 12–18 years test dose, 100 micrograms/kg or 6.25 mg, monitor blood pressure carefully for 1–2 hours; if tolerated, give 12.5–25 mg 2–3 times a day, increased as necessary to max. 150 mg daily in divided doses

Administration Administer under close supervision, see notes above. Give test dose whilst child supine. Tablets can be dispersed in water

Captopril (Non-proprietary) (PwM)

Tablets, captopril 12.5 mg, net price 56-tab pack = £1.59; 25 mg, 56-tab pack = £1.70; 50 mg, 56-tab pack = £2.22

Brands include *Ecopace*®, *Kaplon*®, *Tensopril*®

Liquid, various strengths available from 'special-order' manufacturers or specialist importing companies, see p. 943

▢ CAPTOPRIL (continued)

Capoten[®] (Squibb) (POM)

Tablets, captopril 12.5 mg (scored), net price 56-tab pack = £9.82; 25 mg, 56-tab pack = £11.19, 50 mg (scored), 56-tab pack = £19.07 (also available as *Acepri*[®])

▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

ENALAPRIL MALEATE

Cautions see notes above

Hepatic impairment monitor closely

Renal impairment see notes above; start with low dose and adjust according to response

Breast-feeding avoid in first few weeks after delivery—risk of profound neonatal hypotension; can be used in older infant if essential but monitor infant's blood pressure

Contra-indications see notes above

Pregnancy avoid unless essential (see notes above)

Side-effects see notes above; also dyspnoea; depression, asthenia; blurred vision; *less commonly* dry mouth, peptic ulcer, anorexia, ileus; arrhythmias, palpitation, flushing; confusion, nervousness, drowsiness, insomnia, vertigo; impotence; muscle cramps; tinnitus; alopecia, sweating; hyponatraemia; *rarely* stomatitis, glossitis, Raynaud's syndrome, pulmonary infiltrates, allergic alveolitis, abnormal dreams, gynaecomastia, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, pemphigus; *very rarely* gastro-intestinal angioedema

Licensed use not licensed for use in children for congestive heart failure, proteinuria in nephritis or diabetic nephropathy; not licensed for use in children less than 20 kg for hypertension

Indication and dose

Hypertension, congestive heart failure, proteinuria in nephritis (under specialist supervision)

• **By mouth**

Neonate (limited information) initially 10 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, increased as necessary up to 500 micrograms/kg daily in 1–3 divided doses

Child 1 month–12 years initially 100 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, increased as necessary up to max. 1 mg/kg daily in 1–2 divided doses

Child 12–18 years initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, usual maintenance dose 10–20 mg daily in 1–2 divided doses; max. 40 mg daily in 1–2 divided doses if body-weight over 50 kg

Diabetic nephropathy (under specialist supervision)

• **By mouth**

Child 12–18 years initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, usual maintenance dose 10–20 mg daily in 1–2 divided doses; max. 40 mg daily in 1–2 divided doses if body-weight over 50 kg

Administration Tablets may be crushed and suspended in water immediately before use

Enalapril Maleate (Non-proprietary) (POM)

Tablets, enalapril maleate 2.5 mg, net price 28-tab pack = £1.31; 5 mg, 28-tab pack = £1.10; 10 mg, 28-tab pack = £1.12; 20 mg, 28-tab pack = £1.22
Brands include *Ednyt*[®]

Liquid, various strengths available from 'special-order' manufacturers or specialist importing companies, see p. 943

Innovace[®] (MSD) (POM)

Tablets, enalapril maleate 2.5 mg, net price 28-tab pack = £5.35; 5 mg (scored), 28-tab pack = £7.51; 10 mg (red), 28-tab pack = £10.53; 20 mg (peach), 28-tab pack = £12.51

LISINAPRIL

Cautions see notes above

Renal impairment see notes above; start with low dose and adjust according to response

Breast-feeding avoid—no information available

Contra-indications see notes above

Pregnancy avoid unless essential (see notes above)

Side-effects see notes above; also *less commonly* tachycardia, palpitation, cerebrovascular accident, Raynaud's syndrome, confusion, mood changes, vertigo, sleep disturbances, asthenia, impotence; *rarely* dry mouth, gynaecomastia, alopecia, psoriasis; *very rarely* allergic alveolitis, pulmonary infiltrates, profuse sweating, pemphi-

gus, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Licensed use not licensed for use in children

Indication and dose

Hypertension (under specialist supervision)

Child 6–12 years initially 70 micrograms/kg (max. 5 mg) once daily, increased in intervals of 1–2 weeks to max. 600 micrograms/kg (*or* 40 mg) once daily

Child 12–18 years initially 2.5 mg once daily; usual maintenance dose 10–20 mg once daily; max. 80 mg once daily

◊ LISINAPRIL (continued)

Heart failure (adjunct) (under specialist supervision)

Child 12–18 years initially 2.5 mg once daily; increased in steps no greater than 10 mg at intervals of at least 2 weeks up to max. 35 mg once daily if tolerated

Lisinopril (Non-proprietary) (POM)

Tablets, lisinopril (as dihydrate) 2.5 mg, net price 28-tab pack = 91p; 5 mg, 28-tab pack = £1.02; 10 mg, 28-tab pack = £1.10; 20 mg, 28-tab pack = £1.37

Liquid, various strengths available from 'special-order' manufacturers or specialist importing companies, see p. 943

Carace® (Bristol-Myers Squibb) (POM)

Tablets, lisinopril 5 mg (scored), net price 28-tab pack = £8.51; 10 mg (yellow, scored), 28-tab pack = £10.51; 20 mg (orange, scored), 28-tab pack = £11.89

Zestril® (AstraZeneca) (POM)

Tablets, lisinopril (as dihydrate) 2.5 mg, net price 28-tab pack = £6.26; 5 mg (pink), 28-tab pack = £7.86; 10 mg (pink), 28-tab pack = £9.70; 20 mg (pink), 28-tab pack = £10.97

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

2.5.5.2 Angiotensin-II receptor antagonists

Losartan is a specific angiotensin-II receptor antagonist with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, losartan does not inhibit the breakdown of bradykinin and other kinins, and therefore does not appear to cause the persistent dry cough which commonly complicates ACE inhibitor therapy. It is therefore an alternative for children who have to discontinue an ACE inhibitor because of persistent cough.

Losartan can be used as an alternative to an ACE inhibitor in the management of hypertension; however, evidence for its use in children is very limited.

LOSARTAN POTASSIUM

Cautions renal artery stenosis (see also Renal Effects under ACE inhibitors, section 2.5.5.1); monitor plasma-potassium concentration (particularly in children with renal impairment); aortic or mitral valve stenosis; hypertrophic cardiomyopathy; children with primary aldosteronism and Afro-Caribbean children, particularly those with left ventricular hypertrophy, may not benefit from losartan; **interactions:** Appendix 1 (angiotensin-II receptor antagonists)

Hepatic impairment manufacturer advises avoid in children 6–16 years—no information available; child 17–18 years consider dose reduction in mild to moderate impairment, avoid in severe impairment (no information available)

Renal impairment manufacturer advises avoid in children 6–16 years with estimated glomerular filtration rate less than 30 mL/minute/1.73m²—no information available

Contra-indications

Pregnancy avoid unless essential—may adversely affect fetal and neonatal blood pressure control and renal function; also possible skull defects and oligohydramnios; toxicity in *animal* studies

Breast-feeding avoid—no information available

Side-effects diarrhoea, symptomatic hypotension including dizziness (particularly in children with intravascular volume depletion e.g. those taking

high-dose diuretics); cough, asthenia, vertigo, migraine, hyperkalaemia; arthralgia, myalgia; urticaria, pruritus, rash; *rarely* hepatitis, anaemia (in severe renal disease or following renal transplant), thrombocytopenia, vasculitis (including Henoch-Schönlein purpura), anaphylaxis, and angioedema

Licensed use not licensed for use in children

Indication and dose

Hypertension (under specialist supervision)

• By mouth

Child 6–16 years

Body-weight 20–50 kg initially 25 mg once daily; adjusted according to response to max. 50 mg once daily

Body-weight 50 kg and over initially 50 mg once daily adjusted according to response to max. 100 mg once daily

Child 16–18 years initially 50 mg once daily (intravascular volume depletion, initially 25 mg once daily); if necessary increased after several weeks to 100 mg once daily

Cozaar® (MSD) (POM)

Tablets, f/c, losartan potassium 25 mg, net price 28-tab pack = £16.18; 50 mg (scored), 28-tab pack = £12.80; 100 mg, 28-tab pack = £16.18

2.6 Nitrates, calcium-channel blockers, and other antianginal drugs

- 2.6.1 Nitrates
- 2.6.2 Calcium-channel blockers
- 2.6.3 Other antianginal drugs
- 2.6.4 Peripheral vasodilators and related drugs

Nitrates and calcium-channel blockers have a vasodilating and, consequently, blood-pressure lowering effect. Vasodilators can act in heart failure by arteriolar dilatation, which reduces both peripheral vascular resistance and left ventricular pressure during systole resulting in improved cardiac output. They can also cause venous dilatation, which results in dilatation of capacitance vessels, increase of venous pooling, and diminution of venous return to the heart (decreasing left ventricular end-diastolic pressure).

2.6.1 Nitrates

Nitrates are potent coronary vasodilators, but their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially if the child is unusually sensitive to the effects of nitrates or is hypovolaemic.

For the use of glyceryl trinitrate in extravasation, see section 10.3.

Children receiving nitrates continuously throughout the day can develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 8 hours each day usually maintains effectiveness in such patients.

GLYCERYL TRINITRATE

Cautions hypothyroidism, malnutrition, hypothermia; head trauma, cerebral haemorrhage; hypoxaemia or other ventilation and perfusion abnormalities; metal-containing transdermal systems should be removed before cardioversion or diathermy; avoid abrupt withdrawal; tolerance (see notes above); **interactions:** Appendix 1 (nitrates)

Hepatic impairment caution in severe hepatic impairment

Renal impairment use with caution in severe impairment

Pregnancy not known to be harmful but most manufacturers advise avoid unless potential benefit outweighs risk

Breast-feeding no information available—manufacturers advise use only if potential benefit outweighs risk

Contra-indications hypersensitivity to nitrates; hypotensive conditions and hypovolaemia; hypertrophic cardiomyopathy, aortic stenosis, cardiac tamponade, constrictive pericarditis, mitral stenosis; marked anaemia, closed-angle glaucoma

Side-effects postural hypotension, tachycardia (but paradoxical bradycardia also reported); throbbing headache, dizziness, *less commonly* nausea, vomiting, heartburn; flushing

Injection Specific side-effects following injection (particularly if given too rapidly) include severe hypotension, diaphoresis, apprehension, restlessness, muscle twitching, retrosternal discomfort, palpitation, abdominal pain, syncope; prolonged administration has been associated with methaemoglobinaemia

Licensed use not licensed for use in children

Indication and dose

Hypertension during and after cardiac surgery, cardiac failure after cardiac surgery, coronary vasoconstriction in myocardial ischaemia, vasoconstriction in shock

- By continuous intravenous infusion

Neonate 0.2–0.5 micrograms/kg/minute, dose adjusted according to response; usual dose 1–3 micrograms/kg/minute; max. 10 micrograms/kg/minute

Child 1 month–18 years initially 0.2–0.5 micrograms/kg/minute, dose adjusted according to response, usual dose 1–3 micrograms/kg/minute; max. 10 micrograms/kg/minute (do not exceed 200 micrograms/minute)

Administration for *continuous intravenous infusion* dilute to max. concentration of 400 micrograms/mL (but concentration of 1 mg/mL has been used via a central venous catheter) with Glucose 5% or Sodium Chloride 0.9%.

Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used.

Neonatal intensive care, dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 1 mL/hour provides a dose of 1 microgram/kg/minute

Glyceryl Trinitrate (Non-proprietary) (PAM)

Injection, glyceryl trinitrate 5 mg/mL. To be diluted before use. Net price 5-mL amp = £6.49; 10-mL amp = £12.98

Excipients include ethanol, propylene glycol

◊ **GLYCERYL TRINITRATE** (*continued*)

Nitrocline[®] (UCB Pharma) (POM)

Injection, glyceryl trinitrate 1 mg/mL. To be diluted before use or given undiluted with syringe pump.
Net price 10-mL amp = £7.34; 50-mL bottle = £17.21

Excipients include propylene glycol

Nitronal[®] (Merck) (POM)

Injection, glyceryl trinitrate 1 mg/mL. To be diluted before use or given undiluted with syringe pump.

Net price 5-mL vial = £1.92; 50-mL vial = £15.67

2.6.2 Calcium-channel blockers

Calcium-channel blockers (less correctly called 'calcium-antagonists') interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil, diltiazem, and the dihydropyridine calcium-channel blockers (amlodipine, nifedipine, and nimodipine). Verapamil and diltiazem should usually be **avoided** in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

Verapamil is used for the treatment of hypertension (section 2.5) and arrhythmias (section 2.3.2). However, it is no longer first-line treatment for arrhythmias in children because it has been associated with fatal collapse especially in infants under 1 year; adenosine is now recommended for first-line use.

Verapamil is a highly negatively inotropic calcium channel-blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should **not** be used with beta-blockers (see p. 140). Constipation is the most common side-effect.

Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil, and unlike verapamil has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work. Short-acting formulations of nifedipine are not recommended for long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia. However, they may be used if a modified-release preparation delivering the appropriate dose is not available or if a child is unable to swallow (a liquid preparation may be prepared using capsules). Nifedipine may also be used for the management of angina due to coronary artery disease in Kawasaki disease or progeria and in the management of Raynaud's syndrome.

Nicardipine has similar effects to those of nifedipine and may produce less reduction of myocardial contractility; it is used to treat hypertensive crisis.

Amlodipine also resembles nifedipine and nicardipine in its effects and does not reduce myocardial contractility or produce clinical deterioration in heart failure. It has a longer duration of action and can be given once daily. Nifedipine and amlodipine are used for the treatment of hypertension. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem is a peripheral vasodilator and also has mild depressor effects on the myocardium. It is used in the treatment of Raynaud's syndrome.

Withdrawal There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of myocardial ischaemia.

AMLODIPINE

Cautions interactions: Appendix 1 (calcium-channel blockers)

Hepatic impairment half-life prolonged—may need dose reduction

Pregnancy no information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension

Breast-feeding no information available—manufacturer advises avoid

Contra-indications cardiogenic shock, significant aortic stenosis, acute porphyria (section 9.8.2)

Side-effects abdominal pain, nausea; palpitation, flushing, oedema; headache, dizziness, sleep disturbances, fatigue; *less commonly* gastro-intestinal disturbances, dry mouth, taste disturbances, hypotension, syncope, chest pain, dyspnoea, rhinitis, mood changes, asthenia, tremor, paraesthesia, urinary disturbances, impotence, gynaecomastia, weight changes, myalgia, muscle cramps, back pain, arthralgia, visual disturbances, tinnitus, pruritus, rashes (including isolated reports of erythema multiforme), sweating, alopecia, purpura, and skin discolouration; *very rarely* gastritis, pancreatitis, hepatitis, jaundice, cholestasis, gingival hyperplasia, myocardial infarction, arrhythmias, tachycardia, vasculitis, coughing, peripheral neuropathy, hyperglycaemia, thrombocytopenia, angioedema, and urticaria

DILTIAZEM HYDROCHLORIDE

Cautions heart failure or significantly impaired left ventricular function, bradycardia (avoid if severe), first degree AV block, or prolonged PR interval; **interactions:** Appendix 1 (calcium-channel blockers)

Hepatic impairment reduce dose

Renal impairment start with smaller dose

Breast-feeding significant amount present in milk—no evidence of harm but avoid unless no safer alternative

Contra-indications severe bradycardia, left ventricular failure with pulmonary congestion, second- or third-degree AV block (unless pace-maker fitted), sick sinus syndrome, acute porphyria (but see section 9.8.2)

Pregnancy avoid

Side-effects bradycardia, sino-atrial block, AV block, palpitation, dizziness, hypotension, malaise, asthenia, headache, hot flushes, gastro-intestinal disturbances, oedema (notably of ankles); rarely rashes (including erythema multiforme and exfoliative dermatitis), photosensitivity; hepatitis, gynaecomastia, gum hyperplasia, extrapyramidal symptoms, depression reported

NICARDIPINE HYDROCHLORIDE

Cautions congestive heart failure or significantly impaired left ventricular function; avoid grapefruit juice (may affect metabolism); **interactions:** Appendix 1 (calcium-channel blockers)

Licensed use not licensed for use in children

Indication and dose

Hypertension

• By mouth

Child 1 month–12 years initially 100–200 micrograms/kg once daily; if necessary increase at intervals of 1–2 weeks up to 400 micrograms/kg once daily; max. 10 mg once daily

Child 12–18 years initially 5 mg once daily; if necessary increase at intervals of 1–2 weeks to max. 10 mg once daily

Administration Tablets may be dispersed in water

Note Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable

Amlodipine (Non-proprietary) (POM)

Tablets, amlodipine (as maleate or as mesilate) 5 mg, net price 28-tab pack = £1.12; 10 mg, 28-tab pack = £1.29
Brands include Amlostin®

Istin® (Pfizer) (POM)

Tablets, amlodipine (as besilate) 5 mg, net price 28-tab pack = £13.04; 10 mg, 28-tab pack = £19.47

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

Licensed use not licensed for use in children

Indication and dose

Raynaud's syndrome

• By mouth

Child 12–18 years 30–60 mg 2–3 times daily

▲ Standard formulations

Note These formulations are licensed as generics and there is no requirement for brand name dispensing. Although their means of formulation has called for the strict designation 'modified-release' their duration of action corresponds to that of tablets requiring administration more frequently

Diltiazem (Non-proprietary) (POM)

Tablets, m/r (but see note above), diltiazem hydrochloride 60 mg, net price 84 = £3.34.
Label: 25
Brands include Optil®

Tildiem® (Sanofi-Synthelabo) (POM)

Tablets, m/r (but see note above), off-white, diltiazem hydrochloride 60 mg, net price 90-tab pack = £8.28. Label: 25

Hepatic impairment reduce dose

Renal impairment start with smaller dose

Pregnancy may inhibit labour; toxicity in *animal* studies; manufacturer advises avoid, but risk to

▮ NICARDIPINE HYDROCHLORIDE (*continued*)

fetus should be balanced against risk of uncontrolled maternal hypertension

Contra-indications cardiogenic shock; advanced aortic stenosis; acute porphyria (section 9.8.2)

Breast-feeding no information available—manufacturer advises avoid

Side-effects dizziness, headache, peripheral oedema, flushing, palpitation, nausea; also gastro-intestinal disturbances, drowsiness, insomnia, tinnitus, hypotension, rashes, dyspnoea, paraesthesia, frequency of micturition; thrombocytopenia, depression and impotence reported

Licensed use not licensed for use in children

Indication and dose

Hypertensive crisis

- By continuous intravenous infusion

Neonate initially 500 nanograms/kg/minute, adjusted according to response; usual maintenance of 1–4 micrograms/kg/minute

NIFEDIPINE

Cautions see notes above; also poor cardiac reserve; heart failure or significantly impaired left ventricular function (heart failure deterioration observed); severe hypotension; diabetes mellitus; avoid grapefruit juice (may affect metabolism); **interactions:** Appendix 1 (calcium-channel blockers)

Hepatic impairment dose reduction may be required in severe liver disease

Pregnancy may inhibit labour; manufacturer advises avoid before week 20, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension; use only if other treatment options are not indicated or have failed

Breast-feeding amount too small to be harmful but manufacturer advises avoid

Contra-indications cardiogenic shock; advanced aortic stenosis; acute porphyria (section 9.8.2)

Side-effects gastro-intestinal disturbance; hypotension, oedema, vasodilatation, palpitation; headache, dizziness, lethargy, asthenia; *less commonly* tachycardia, hypotension, syncope, chills, nasal congestion, dyspnoea, anxiety, sleep disturbance, vertigo, migraine, paraesthesia, tremor, polyuria, dysuria, nocturia, erectile dysfunction, epistaxis, myalgia, joint swelling, visual disturbance, sweating, and hypersensitivity reactions (including angioedema, jaundice, pruritus, urticaria, and rash); *rarely* anorexia, gum hyperplasia, mood disturbances, hyperglycaemia, male infertility, purpura, and photosensitivity reactions; also reported dysphagia, intestinal obstruction, intestinal ulcer, bezoar formation, gynaecomastia, agranulocytosis, and anaphylaxis

Licensed use not licensed for use in children

Indication and dose

Hypertensive crisis, acute angina in Kawasaki disease or progeria

- By mouth (see Administration, below)

Child 1 month–18 years 250–500 micrograms/kg as a single dose

Child 1 month–18 years initially 500 nanograms/kg/minute, adjusted according to response; usual maintenance of 1–4 micrograms/kg/minute (max. 250 micrograms/minute)

Administration for *intravenous infusion*, dilute to a concentration of 100 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; to minimise peripheral venous irritation, change site of infusion every 12 hours

Cardene IV® (PoM)

Injection, nifedipine 2.5 mg/mL (10-mL ampoule) Available from 'special-order' manufacturers or specialist importing companies, see p.943

Hypertension, angina in Kawasaki disease or progeria

- By mouth

Child 1 month–12 years 200–300 micrograms/kg 3 times daily; max. 3 mg/kg daily or 90 mg daily

Child 12–18 years 5–20 mg 3 times daily; max. 90 mg daily

Note Dose frequency depends on preparation used

Raynaud's syndrome

- By mouth

Child 2–18 years 2.5–10 mg 2–4 times daily; start with low doses at night and increase gradually to avoid postural hypotension

Note Dose frequency depends on preparation used

Persistent hyperinsulinaemic hypoglycaemia

see also section 6.1.4

- By mouth

Neonates 100–200 micrograms/kg (max. 600 micrograms/kg) 4 times daily

Administration for rapid effect in hypertensive crisis or acute angina, use capsules or use liquid if 5- or 10-mg dose inappropriate; if liquid unavailable, extract contents of capsule via a syringe and use immediately—cover syringe with foil to protect contents from light; capsule contents may be diluted with water if necessary.

Modified-release tablets may be crushed—this may alter the release profile; crushed tablets should be administered within 30–60 seconds to avoid significant loss of potency of drug

Nifedipine (Non-proprietary) (PoM)

Capsules, nifedipine 5 mg, net price 84-cap pack = £2.84; 10 mg, 84-cap pack = £3.94

Dose

Give 3 times daily

▮ NIFEDIPINE (continued)

Oral liquid, available from 'special-order' manufacturers or specialist importing companies, see p. 943

Adalat® (Bayer) (PoM)

Capsules, orange, nifedipine 5 mg, net price 90-cap pack = £6.08; 10 mg, 90-cap pack = £7.74

Dose

Give 3 times daily

▮ Modified release

Note Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of nifedipine, prescribers should specify the brand to be dispensed. Modified-release formulations may not be suitable for dose titration in hepatic disease

Adalat® LA (Bayer) (PoM)

LA 20 tablets, m/r, f/c, pink, nifedipine 20 mg, net price 28-tab pack = £5.27. Label: 25

LA 30 tablets, m/r, f/c, pink, nifedipine 30 mg, net price 28-tab pack = £7.59. Label: 25

LA 60 tablets, m/r, f/c, pink, nifedipine 60 mg, net price 28-tab pack = £9.69. Label: 25

Counselling Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy

Cautions dose form not appropriate for use in hepatic impairment or where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, or inflammatory bowel disease (including Crohn's disease)

Dose

Give once daily

Adalat® Retard (Bayer) (PoM)

Retard 10 tablets, m/r, f/c, grey-pink, nifedipine 10 mg, net price 56-tab pack = £8.50. Label: 25

Retard 20 tablets, m/r, f/c, grey-pink, nifedipine 20 mg, net price 56-tab pack = £10.20. Label: 25

Dose

Give twice daily

Adipine® MR (Chiesi) (PoM)

Tablets, m/r, nifedipine 10 mg (apricot), net price 56-tab pack = £5.96; 20 mg (pink), 56-tab pack = £7.43. Label: 21, 25

Dose

Give twice daily

Adipine® XL (Chiesi) (PoM)

Tablets, m/r, red, nifedipine 30 mg, net price 28-tab pack = £5.89. Label: 25

Dose

Give once daily

Coracten SR® (UCB Pharma) (PoM)

Capsules, m/r, nifedipine 10 mg (grey/pink, enclosing yellow pellets), net price 60-cap pack = £4.70; 20 mg (pink/brown, enclosing yellow pellets), 60-cap pack = £6.52. Label: 25

Dose

Give twice daily

Coracten XL® (UCB Pharma) (PoM)

Capsules, m/r, nifedipine 30 mg (brown), net price 28-cap pack = £5.89; 60 mg (orange), 28-cap pack = £8.84. Label: 25

Dose

Give once daily

Fortipine LA 40® (Goldshield) (PoM)

Tablets, m/r, red, nifedipine 40 mg, net price 30-tab pack = £9.60. Label: 21, 25

Dose

Give 1–2 times daily

Hypolar® Retard 20 (Sandoz) (PoM)

Tablets, m/r, red, f/c, nifedipine 20 mg, net price 56-tab pack = £5.75. Label: 25

Dose

Give twice daily

Nifedipress® MR (Dexcel) (PoM)

Tablets, m/r, pink, nifedipine 10 mg, net price 56-tab pack = £9.23; 20 mg, 56-tab pack = £10.06. Label: 25

Dose

Give twice daily

Note Also available as *Calchan*® MR

Tensipine MR® (Genus) (PoM)

Tablets, m/r, pink-grey, nifedipine 10 mg, net price 56-tab pack = £4.30; 20 mg, 56-tab pack = £5.49. Label: 21, 25

Dose

Give twice daily

Valni XL® (Winthrop) (PoM)

Tablets, m/r, red, nifedipine 30 mg, net price 28-tab pack = £9.89; 60 mg, 28-tab pack = £14.71. Label: 25

Cautions dose form not appropriate for use in hepatic impairment, or where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, inflammatory bowel disease, or ileostomy after proctocolectomy

Dose

Give once daily

NIMODIPINE

Cautions cerebral oedema or severely raised intracranial pressure; hypotension; avoid concomitant administration of nimodipine tablets and infusion, other calcium-channel blockers, or beta-blockers; concomitant nephrotoxic drugs; avoid grapefruit juice (may affect metabolism); **interactions:** Appendix 1 (calcium-channel blockers, alcohol (infusion only))

Hepatic impairment elimination reduced in cirrhosis—monitor blood pressure; reduce oral dose by 50% in children with severe cirrhosis

Renal impairment manufacturer advises monitor renal function closely

Pregnancy manufacturer advises use only if potential benefit outweighs risks

Contra-indications acute porphyria (section 9.8.2)

Side-effects hypotension, variation in heart-rate, flushing, headache, gastro-intestinal disorders, nausea, sweating and feeling of warmth; thrombocytopenia and ileus reported

Licensed use not licensed for use in children

Indication and dose

Treatment of vasospasm following subarachnoid haemorrhage under specialist advice only

• By intravenous infusion

Child 1 month–12 years initially 15 micrograms/kg/hour (max. 500 micrograms/hour) or initially 7.5 micrograms/kg/hour if blood pressure unstable; increase after 2 hours to 30 micrograms/kg/hour (max. 2 mg/hour) if no severe decrease in blood pressure; continue for at least 5 days (max. 14 days)

Child 12–18 years initially 500 micrograms/hour (up to 1 mg/hour if body-weight over 70 kg and blood pressure stable), increase after 2 hours to 1–2 mg/hour if no severe fall in blood pressure; continue for at least 5 days (max. 14 days)

Prevention of vasospasm following subarachnoid haemorrhage

• By mouth

Child 1 month–18 years 0.9–1.2 mg/kg (max. 60 mg) 6 times daily, starting within 4 days of haemorrhage and continued for 21 days

Administration for *continuous intravenous infusion*, administer undiluted via a Y-piece on a central venous catheter connected to a running infusion of Glucose 5%, Sodium Chloride 0.9%, or Compound Sodium Lactate; not to be added to an infusion container; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light.

For administration *by mouth*, tablets may be crushed or halved but are light sensitive—administer immediately

Nimotop® (Bayer) (POM)

Tablets, yellow, f/c, nimodipine 30 mg, net price 100-tab pack = £38.85

Intravenous infusion, nimodipine 200 micrograms/mL; also contains ethanol 20% and macrogol '400' 17%. Net price 50-mL vial (with polyethylene infusion catheter) = £13.24

Note Polyethylene, polypropylene, or glass apparatus should be used; PVC should be avoided

VERAPAMIL HYDROCHLORIDE

Cautions first-degree AV block; patients taking beta-blockers (**important:** see below); avoid grapefruit juice (may affect metabolism); **interactions:** Appendix 1 (calcium-channel blockers)

Verapamil and beta-blockers Verapamil injection should not be given to patients recently treated with beta-blockers because of the risk of hypotension and asystole. The suggestion that when verapamil injection has been given first, an interval of 30 minutes before giving a beta-blocker is sufficient has not been confirmed.

It may also be hazardous to give verapamil and a beta-blocker together by mouth (should only be contemplated if myocardial function well preserved).

Hepatic impairment oral dose may need to be reduced

Pregnancy may reduce uterine blood flow with fetal hypoxia; manufacturer advises avoid during first trimester unless absolutely necessary; may inhibit labour

Breast-feeding amount too small to be harmful

Contra-indications hypotension, bradycardia, second- and third-degree AV block, sick sinus syndrome, cardiogenic shock, sino-atrial block; history of heart failure or significantly impaired left ventricular function, even if controlled by therapy; atrial flutter or fibrillation complicating syndromes associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome); acute porphyria (section 9.8.2)

Side-effects constipation; *less commonly* nausea, vomiting, flushing, headache, dizziness, fatigue, ankle oedema; *rarely* allergic reactions (erythema, pruritus, urticaria, angioedema, Stevens-Johnson syndrome); myalgia, arthralgia, paraesthesia, erythromelalgia; increased prolactin concentration; gynaecomastia and gingival hyperplasia after long-term treatment; after intravenous administration or high doses, hypotension, heart failure, bradycardia, heart block, and asystole; hypersensitivity reactions involving reversibly raised liver function tests

Licensed use Modified release preparation not licensed for use in children

Indication and dose

Hypertension, prophylaxis of supraventricular arrhythmias under specialist advice only

• By mouth

Child 1–2 years 20 mg 2–3 times daily

Child 2–18 years 40–120 mg 2–3 times daily

◊ VERAPAMIL HYDROCHLORIDE (continued)

Treatment of supraventricular arrhythmias

- By intravenous injection over 2–3 minutes (with ECG and blood-pressure monitoring and under specialist advice)

Child 1–18 years 100–300 micrograms/kg (max. 5 mg) as a single dose, repeated after 30 minutes if necessary

Administration for intravenous injection, may be diluted with Glucose 5% or Sodium Chloride 0.9%; incompatible with solutions of pH greater than 6

Verapamil (Non-proprietary) (POM)

Tablets, coated, verapamil hydrochloride 40 mg, net price 84-tab pack = £1.54; 80 mg, 84-tab pack = £1.68; 120 mg, 28-tab pack = £1.41; 160 mg, 56-tab pack = £20.23

Oral solution, verapamil hydrochloride 40 mg/5 mL, net price 150 mL = £36.90
Brands include *Zolvera*®

Cordilox® (Dexcel) (POM)

Tablets, yellow, f/c, verapamil hydrochloride 40 mg, net price 84-tab pack = £1.50; 80 mg, 84-tab pack = £2.05; 120 mg, 28-tab pack = £1.15; 160 mg, 56-tab pack = £2.80

Injection, verapamil hydrochloride 2.5 mg/mL, net price 2-mL amp = £1.11

Securon® (Abbott) (POM)

Injection, verapamil hydrochloride 2.5 mg/mL, net price 2-mL amp = £1.08

- ▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

▲ Modified release

Half Securon SR® (Abbott) (POM)

Tablets, m/r, f/c, verapamil hydrochloride 120 mg, net price 28-tab pack = £7.50. Label: 25

Dose

Give once daily (doses above 240 mg daily, give 2–3 times daily)

Securon SR® (Abbott) (POM)

Tablets, m/r, pale green, f/c, scored, verapamil hydrochloride 240 mg, net price 28-tab pack = £6.29. Label: 25

Dose

Give once daily (doses above 240 mg daily, give 2–3 times daily)

Univer® (Cephalon) (POM)

Capsules, m/r, verapamil hydrochloride 120 mg (yellow/dark blue), net price 28-cap pack = £7.51; 180 mg (yellow), 56-cap pack = £18.15; 240 mg (yellow/dark blue), 28-cap pack = £12.24. Label: 25

Dose

Give once daily

Verapress MR® (Dexcel) (POM)

Tablets, m/r, pale green, f/c, verapamil hydrochloride 240 mg, net price 28-tab pack = £9.90. Label: 25

Dose

Give 1–2 times daily

Note Also available as *Cordilox® MR*

Vertab® SR 240 (Chiesi) (POM)

Tablets, m/r, pale green, f/c, scored, verapamil hydrochloride 240 mg, net price 28-tab pack = £8.63. Label: 25

Dose

Give 1–2 times daily

2.6.3 Other antianginal drugs

Classification not used in *BNF for Children*.

2.6.4 Peripheral vasodilators and related drugs

Raynaud's syndrome consists of recurrent, long-lasting, and episodic vasospasm of the fingers and toes often associated with exposure to cold. Management includes avoidance of exposure to cold and stopping smoking (if appropriate). More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud's syndrome. **Nifedipine** and **diltiazem** (section 2.6.2) are useful for reducing the frequency and severity of vasospastic attacks. In very severe cases, where digital infarction is likely, intravenous infusion of the prostacyclin analogue **iloprost** may be helpful.

Vasodilator therapy is not established as being effective for *chilblains* (section 13.13).

ILOPROST

Cautions see section 2.5.1.2

Contra-indications see section 2.5.1.2

Side-effects see section 2.5.1.2

Licensed use not licensed for use in children

Indication and dose

Pulmonary hypertension section 2.5.1.2

Raynaud's syndrome see notes above

- By intravenous infusion

Child 12–18 years initially 30 nanograms/kg/hour, increased gradually to 60–120 nanograms/kg/hour given over 6 hours daily for 3–5 days

□ ILOPROST (*continued*)

Administration For intravenous infusion dilute with Glucose 5% or Sodium Chloride 0.9% to a concentration of 200 nanograms/mL; alternatively, may be diluted to a concentration of 2 micrograms/mL and given via syringe driver

Iloprost (Non-proprietary)

Concentrate for infusion, iloprost 100 micrograms/mL (as iloprost trometamol).

For dilution and use as an intravenous infusion

Note available on a named patient basis from Bayer in 0.5 mL and 1 mL ampoules

2.7 Sympathomimetics

2.7.1 Inotropic sympathomimetics

2.7.2 Vasoconstrictor sympathomimetics

2.7.3 Cardiopulmonary resuscitation

The properties of sympathomimetics vary according to whether they act on alpha or on beta adrenergic receptors. Response to sympathomimetics can also vary considerably in children, particularly neonates. It is important to titrate the dose to the desired effect and to monitor the child closely.

2.7.1 Inotropic sympathomimetics

The cardiac stimulants **dobutamine** and **dopamine** act on beta₁ receptors in cardiac muscle and increase contractility with little effect on rate.

Dopamine has a variable, unpredictable, and dose dependent impact on vascular tone. Low dose infusion (2 micrograms/kg/minute) normally causes vasodilatation, but there is little evidence that this is clinically beneficial; moderate doses increase myocardial contractility and cardiac output in older children, but in neonates moderate doses may cause a reduction in cardiac output. High doses cause vasoconstriction and increase vascular resistance, and should therefore be used with caution following cardiac surgery, or where there is co-existing neonatal pulmonary hypertension.

In neonates the response to inotropic sympathomimetics varies considerably, particularly in those born prematurely; careful dose titration and monitoring are necessary.

Isoprenaline injection is available from 'special-order' manufacturers or specialist importing companies, see p. 943.

Shock Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis or myocardial insufficiency should be corrected. Additional treatment is dependent on the type of shock.

Septic shock is associated with severe hypovolaemia (due to vasodilation and capillary leak) which should be corrected with crystalloids or colloids (section 9.2.2). If hypotension persists despite volume replacement, **dopamine** should be started. For shock refractory to treatment with dopamine, if cardiac output is high and peripheral vascular resistance is low (warm shock), **noradrenaline** (norepinephrine) (section 2.7.2) should be added or if cardiac output is low and peripheral vascular resistance is high (cold shock), **adrenaline** (epinephrine) (section 2.7.2) should be added. Additionally, in cold shock, a vasodilator such as **milrinone** (section 2.1.2), **glyceryl trinitrate** (section 2.6.1), or **sodium nitroprusside** (on specialist advice only) (section 2.5.1.1) can be used to reduce vascular resistance.

If the shock is resistant to volume expansion and catecholamines, and there is suspected or proven adrenal insufficiency, low dose **hydrocortisone** (section 6.3.2) can be used. ACTH-stimulated plasma-cortisol concentration should be measured; however, hydrocortisone can be started without such information.

Alternatively, if the child is resistant to catecholamines, and vascular resistance is low, **vasopressin** (section 6.5.2) can be added.

Neonatal septic shock can be complicated by the transition from fetal to neonatal circulation. Treatment to reverse right ventricular failure, by decreasing pulmonary artery pressures, is commonly needed in neonates with fluid-refractory

shock and persistent pulmonary hypertension of the newborn (section 2.5.1.2). Rapid administration of fluid in neonates with patent ductus arteriosus may cause left-to-right shunting and congestive heart failure induced by ventricular overload.

In *cardiogenic shock*, the aim is to improve cardiac output and to reduce the afterload on the heart. If central venous pressure is low, cautious volume expansion with a colloid or crystalloid can be used. An inotrope such as **adrenaline** (epinephrine) (section 2.7.2) or **dopamine** should be given to increase cardiac output. **Dobutamine** is a peripheral vasodilator and is an alternative if hypotension is not significant.

Milrinone (section 2.1.2) has both inotropic and vasodilatory effects and can be used when vascular resistance is high. Alternatively, **glyceryl trinitrate** (2.6.1) or **sodium nitroprusside** (on specialist advice only) (section 2.5.1.1) can be used to reduce vasoconstriction.

Hypovolaemic shock should be treated with a crystalloid or colloid solution (or whole or reconstituted blood if source of hypovolaemia is haemorrhage) and further steps to improve cardiac output and decrease vascular resistance can be taken, as in cardiogenic shock.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

For advice on the management of anaphylactic shock, see section 3.4.3.

DOBUTAMINE

Cautions hyperthyroidism; **interactions:** Appendix 1 (sympathomimetics)

Pregnancy no information available

Contra-indications marked obstruction of cardiac ejection, such as idiopathic hypertrophic subaortic stenosis

Side-effects tachycardia and marked increase in systolic blood pressure indicate overdosage; phlebitis; rarely thrombocytopenia

Licensed use not licensed for use in children

Indication and dose

Inotropic support in low cardiac output states, after cardiac surgery, cardiomyopathies, shock

- By continuous intravenous infusion

Neonate initially 5 micrograms/kg/minute, adjusted according to response to 2–15 micrograms/kg/minute; max. 20 micrograms/kg/minute

Child 1 month–18 years initially 5 micrograms/kg/minute adjusted according to response to 2–20 micrograms/kg/minute

Administration for *continuous intravenous infusion*, using infusion pump, dilute to a concentration of 0.5–1 mg/mL (max. 5 mg/mL if fluid restricted) with Glucose 5% or Sodium Chloride 0.9%; infuse higher concentration solutions through central venous catheter only. Incompatible with bicarbonate and other strong alkaline solutions.

Neonatal intensive care, dilute 30 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.5 mL/hour provides a dose of 5 micrograms/kg/minute

Dobutamine (Non-proprietary) ^(PAM)

Strong sterile solution, dobutamine (as hydrochloride) 12.5 mg/mL. For dilution and use as an intravenous infusion. Net price 20-mL amp = £5.20

DOPAMINE HYDROCHLORIDE

Cautions correct hypovolaemia; hyperthyroidism; **interactions:** Appendix 1 (sympathomimetics)

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Contra-indications tachyarrhythmia, phaeochromocytoma

Side-effects nausea and vomiting, peripheral vasoconstriction, hypotension, hypertension, tachycardia

Licensed use not licensed for use in children under 12 years

Indication and dose

To correct the haemodynamic imbalance due to acute hypotension, shock, cardiac failure, adjunct following cardiac surgery

- By continuous intravenous infusion

Neonate initially 3 micrograms/kg/minute, adjusted according to response (max. 20 micrograms/kg/minute)

Child 1 month–18 years initially 5 micrograms/kg/minute adjusted according to response (max. 20 micrograms/kg/minute)

Administration for *continuous intravenous infusion*, dilute to a max. concentration of 3.2 mg/mL with Glucose 5% or Sodium Chloride 0.9%. Infuse higher concentrations through central venous catheter using a syringe pump to avoid extravasation.

□ DOPAMINE HYDROCHLORIDE (continued)

sation and fluid overload. Incompatible with bicarbonate and other alkaline solutions.

Neonatal intensive care, dilute 30 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.3 mL/hour provides a dose of 3 micrograms/kg/minute

Dopamine (Non-proprietary) (POM)

Sterile concentrate, dopamine hydrochloride 40 mg/mL, net price 5-mL amp = £3.88; 160 mg/mL, net price 5-mL amp = £14.75. For dilution and use as an intravenous infusion

Intravenous infusion, dopamine hydrochloride 1.6 mg/mL in glucose 5% intravenous infusion, net price 250-mL container (400 mg) = £11.69; 3.2 mg/mL, 250-mL container (800 mg) = £22.93 (both hosp. only)

Select-A-Jet® Dopamine (UCB Pharma) (POM)

Strong sterile solution, dopamine hydrochloride 40 mg/mL. For dilution and use as an intravenous infusion. Net price 5-mL vial = £5.01; 10-mL vial = £8.05

2.7.2 Vasoconstrictor sympathomimetics

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed (see also section 2.7.1).

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Ephedrine is used to reverse hypotension caused by spinal and epidural anaesthesia.

Metaraminol is used as a vasopressor during cardiopulmonary bypass.

Phenylephrine causes peripheral vasoconstriction and increases arterial pressure.

Ephedrine, metaraminol and phenylephrine are rarely needed in children and should be used under specialist supervision.

Noradrenaline (norepinephrine) is reserved for children with low systemic vascular resistance that is unresponsive to fluid resuscitation following septic shock, spinal shock, and anaphylaxis.

Adrenaline (epinephrine) is mainly used for its inotropic action. Low doses (acting on beta receptors) cause systemic and pulmonary vasodilation, with some increase in heart rate and stroke volume and also an increase in contractility; high doses act predominantly on alpha receptors causing intense systemic vasoconstriction.

EPHEDRINE HYDROCHLORIDE

Cautions hyperthyroidism, diabetes mellitus, hypertension, susceptibility to angle-closure glaucoma, **interactions:** Appendix 1 (sympathomimetics)

Renal impairment use with caution

Pregnancy increased fetal heart rate reported

Contra-indications

Breast-feeding irritability and disturbed sleep reported in breast-fed infants

Side-effects nausea, vomiting, anorexia; tachycardia (sometimes bradycardia), arrhythmias, anginal pain, vasoconstriction with hypertension, vasodilation with hypotension, dizziness and flushing; dyspnoea; headache, anxiety, restlessness, confusion, psychoses, insomnia, tremor; difficulty in micturition, urine retention; sweating, hypersalivation; changes in blood-glucose concentration

Indication and dose

Reversal of hypotension from epidural and spinal anaesthesia

- By slow intravenous injection of a solution containing ephedrine hydrochloride 3 mg/mL

Child 1–12 years 500–750 micrograms/kg or 17–25 mg/m² every 3–4 minutes according to response; max. 30 mg during episode

Child 12–18 years 3–7.5 mg (max. 9 mg) repeated every 3–4 minutes according to response, max. 30 mg during episode

Nasal congestion section 12.2.2

Administration By slow intravenous injection, via central line.

Ephedrine Hydrochloride (Non-proprietary) (POM)

Injection, ephedrine hydrochloride 3 mg/mL, net price 10-mL amp = £2.83; 30 mg/mL, net price 1-mL amp = £1.70

METARAMINOL

Cautions see under Noradrenaline; longer duration of action than noradrenaline (norepinephrine), see below; cirrhosis; **interactions:** Appendix 1 (sympathomimetics)

Hypertensive response Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure

Breast-feeding manufacturer advises caution—no information available

Contra-indications see under Noradrenaline

Pregnancy may reduce placental perfusion—manufacturer advises use only if potential benefit outweighs risk

Side-effects see under Noradrenaline; tachycardia; fatal ventricular arrhythmia reported in Laennec's cirrhosis

Licensed use Not licensed for use in children

Indication and dose

Acute hypotension

- By intravenous infusion

Child 12–18 years 15–100 mg adjusted according to response

Emergency treatment of acute hypotension

- By intravenous administration

Child 12–18 years initially by intravenous injection 0.5–5 mg, then by intravenous infusion 15–100 mg adjusted according to response

Administration for *intravenous infusion* dilute to a concentration of 30–200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter

Metaraminol (Non-proprietary) ^(POM)

Injection, metaraminol 10 mg (as tartrate)/mL.

Available from 'special-order' manufacturers or specialist importing companies, see p.943

NORADRENALINE/NOREPINEPHRINE

Cautions coronary, mesenteric, or peripheral vascular thrombosis; Prinzmetal's variant angina, hyperthyroidism, diabetes mellitus; hypoxia or hypercapnia; uncorrected hypovolaemia; extravasation at injection site may cause necrosis; **interactions:** Appendix 1 (sympathomimetics)

Contra-indications hypertension (monitor blood pressure and rate of flow frequently)

Pregnancy avoid—may reduce placental perfusion

Side-effects hypertension, headache, bradycardia, arrhythmias, peripheral ischaemia

Licensed use not licensed for use in children

Indication and dose

Acute hypotension (septic shock) or shock secondary to excessive vasodilation (as noradrenaline)

- By continuous intravenous infusion

Neonate 20–100 nanograms(base)/kg/minute adjusted according to response; max. 1 microgram(base)/kg/minute

Child 1 month–18 years 20–100 nanograms(base)/kg/minute adjusted according to response; max. 1 microgram(base)/kg/minute

Note 1 mg of noradrenaline acid tartrate is equivalent to 500 micrograms of the base. Dose expressed as the base

Administration for *continuous intravenous infusion*, dilute to a max. concentration of noradrenaline (base) 40 micrograms/mL (higher concentrations can be used if fluid-restricted) with Glucose 5% or Sodium Chloride and Glucose. Infuse through central venous catheter; discard if discoloured. Incompatible with bicarbonate or alkaline solutions.

Neonatal intensive care, dilute 600 micrograms (base)/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 20 nanograms (base)/kg/minute

Noradrenaline/Norepinephrine (Non-proprietary) ^(POM)

Injection, noradrenaline acid tartrate 2 mg/mL (equivalent to noradrenaline base 1 mg/mL). For dilution before use. Net price 2-mL amp = £1.01, 4-mL amp = £1.50, 20-mL amp = £6.35

Excipients may include sodium metabisulphite

PHENYLEPHRINE HYDROCHLORIDE

Cautions see under Noradrenaline; longer duration of action than noradrenaline (norepinephrine), see below; coronary disease

Hypertensive response Phenylephrine has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure

Contra-indications see under Noradrenaline; severe hyperthyroidism

Pregnancy avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradycardia reported in late pregnancy and labour

Side-effects see under Noradrenaline; tachycardia or reflex bradycardia

Licensed use not licensed for use in children by intravenous infusion or injection

Indication and dose

Acute hypotension

- By subcutaneous or intramuscular injection (but intravenous injection preferred, see below)

Child 1–12 years 100 micrograms/kg every 1–2 hours as needed (max. 5 mg)

□ PHENYLEPHRINE HYDROCHLORIDE (*continued*)

Child 12–18 years 2–5 mg, followed if necessary by further doses of 1–10 mg (max. initial dose 5 mg)

- **By slow intravenous injection**

Child 1–12 years 5–20 micrograms/kg (max. 500 micrograms) repeated as necessary after at least 15 minutes

Child 12–18 years 100–500 micrograms repeated as necessary after at least 15 minutes

- **By intravenous infusion**

Child 1–16 years 100–500 nanograms/kg/minute, adjusted according to response

Child 16–18 years initially up to 180 micrograms/minute reduced to 30–60 micrograms/minute according to response

Administration for *intravenous injection* dilute to a concentration of 1 mg/mL with Water for Injections and administer slowly.

For *intravenous infusion* dilute to a concentration of 20 micrograms/mL with Glucose 5% or Sodium Chloride 0.9% and administer as a continuous infusion via a central venous catheter using a controlled infusion device

Phenylephrine (Sovereign) ^(POM)

Injection, phenylephrine hydrochloride 10 mg/mL (1%), net price 1-mL amp = £5.50

ADRENALINE/EPINEPHRINE

Cautions diabetes mellitus, hyperthyroidism, hypertension, arrhythmias, cerebrovascular disease, avoid extravasation, monitor urine output, limb perfusion (especially at higher doses), central venous pressures and ECG; **interactions:** Appendix 1 (sympathomimetics)

Side-effects nausea, vomiting, sweating, tachycardia, dyspnoea, anxiety, tremor, headache, weakness, dizziness and hyperglycaemia, cold extremities; in overdosage hypertension, arrhythmias, cerebral haemorrhage, pulmonary oedema

Indication and dose

Acute hypotension

- **By continuous intravenous infusion**

Neonate initially 100 nanograms/kg/minute adjusted according to response; higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension

Child 1 month–18 years initially 100 nanograms/kg/minute adjusted according to

response; higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension

Anaphylaxis section 3.4.3

Administration for *continuous intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter. Incompatible with bicarbonate and alkaline solutions.

Neonatal intensive care, dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute
Note These infusions are usually made up with adrenaline 1 in 1000 (1 mg/mL) solution; this concentration of adrenaline is not licensed for intravenous administration

Preparations

Section 3.4.3

2.7.3 Cardiopulmonary resuscitation

The algorithms for cardiopulmonary resuscitation (see inside back cover) reflect the recommendations of the Resuscitation Council (UK); they cover paediatric basic life support, paediatric advanced life support, and newborn life support. The guidelines are available at www.resus.org.uk.

Paediatric advanced life support Cardiopulmonary (cardiac) arrest in children is rare and frequently represents the terminal event of progressive shock or respiratory failure.

During cardiopulmonary arrest in children without intravenous access, the intraosseous route is chosen because it provides rapid and effective response; if circulatory access cannot be gained, the endotracheal tube can be used. When the endotracheal route is used ten times the intravenous dose should be used; the drug should be injected quickly down a narrow bore suction catheter beyond the tracheal end of the tube and then flushed in with 1 or 2 mL of sodium chloride 0.9%. The endotracheal route is useful for lipid-soluble drugs, including lidocaine, adrenaline, atropine, and naloxone. Drugs that are not lipid-soluble (e.g. sodium bicarbonate and calcium chloride) should **not** be administered by this route because they will injure the airways.

For the management of acute anaphylaxis see section 3.4.3.

2.8 Anticoagulants and protamine

2.8.1 Parenteral anticoagulants

2.8.2 Oral anticoagulants

2.8.3 Protamine sulphate

Although thrombotic episodes are uncommon in childhood, anticoagulants may be required in children with congenital heart disease; in children undergoing haemodialysis; for preventing thrombosis in children requiring chemotherapy and following surgery; and for systemic venous thromboembolism secondary to inherited thrombophilias, systemic lupus erythematosus, or indwelling central venous catheters.

2.8.1 Parenteral anticoagulants

Heparin

Heparin initiates anticoagulation rapidly but has a short duration of action. It is now often referred to as being **standard** or **unfractionated heparin** to distinguish it from the **low molecular weight heparins** (see p.149), which have a longer duration of action. For children at high risk of bleeding, heparin is more suitable than low molecular weight heparin because its effect can be terminated rapidly by stopping the infusion.

Heparin is used in both the treatment and prophylaxis of thromboembolic disease; however, it is mainly used to prevent further clotting rather than to lyse existing clots—surgery or a thrombolytic drug may be necessary if a thrombus obstructs major vessels.

Treatment For the initial treatment of thrombotic episodes heparin is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or by intermittent subcutaneous injection; the use of intermittent intravenous injection is no longer recommended. Alternatively, a low molecular weight heparin may be given for initial treatment. An oral anticoagulant (usually warfarin, section 2.8.2) is started at the same time as the heparin (the heparin needs to be continued for at least 5 days and until the INR has been in the therapeutic range for 2 consecutive days). Laboratory monitoring of coagulation activity, preferably on a daily basis, involves determination of the activated partial thromboplastin time (APTT) or of the anti-Factor Xa concentration. Local guidelines on recommended APTT for neonates and children should be followed.

Prophylaxis Low-dose heparin by subcutaneous injection is used to prevent thrombotic episodes in 'high-risk' patients; laboratory monitoring of APTT or anti-Factor Xa concentration is also required in prophylactic regimens in children. **Aspirin** (section 2.9) and **warfarin** (section 2.8.2) can also be used for prophylaxis.

Pregnancy Heparins are used for the management of thromboembolic disease in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin, enoxaparin, and tinzaparin. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

Extracorporeal circuits Heparin is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

Haemorrhage If haemorrhage occurs it is usually sufficient to withdraw heparin, but if rapid reversal of the effects of heparin is required, protamine sulphate (section 2.8.3) is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

HEPARIN

Cautions see notes above; concomitant use of drugs that increase risk of bleeding; **interactions:** Appendix 1 (heparin)

Heparin-induced thrombocytopenia Clinically important heparin-induced thrombocytopenia is immune-mediated and does not usually develop until after 5–10 days; it can be complicated by thrombosis. Platelet counts should be measured just before treatment with heparin or low molecular weight heparins, and regular monitoring of platelet counts is recommended if given for longer than 4 days. Signs of heparin-induced thrombocytopenia include a 50% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, heparin should be **stopped** and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin

Hyperkalaemia Inhibition of aldosterone secretion by heparin (including low molecular weight heparins) can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium, or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy and the CSM has recommended that plasma-potassium concentration should be measured in children at risk of hyperkalaemia before starting heparin and monitored regularly thereafter, particularly if heparin is to be continued for longer than 7 days

Hepatic impairment risk of bleeding increased—possibly reduce dose in severe impairment

Renal impairment risk of bleeding increased in severe impairment—dose may need to be reduced

Pregnancy does not cross the placenta; maternal osteoporosis reported after prolonged use; multi-dose vials may contain benzyl alcohol—some manufacturers advise avoid

Breast-feeding not excreted in milk due to high molecular weight

Contra-indications haemophilia and other haemorrhagic disorders, thrombocytopenia (including history of heparin-induced thrombocytopenia), recent cerebral haemorrhage, severe hypertension; severe liver disease (including oesophageal varices), peptic ulcer; after major trauma or recent surgery to eye or nervous system; acute bacterial endocarditis; spinal or epidural anaesthesia with treatment doses of heparin; hypersensitivity to heparin or low molecular weight heparins

Side-effects haemorrhage (see notes above), thrombocytopenia (see Cautions), rarely rebound hyperlipidaemia following heparin withdrawal, priapism, hyperkalaemia (see Cautions), osteoporosis (risk lower with low molecular weight heparins), alopecia on prolonged use, injection-site reactions, skin necrosis, and hypersensitivity reactions (including urticaria, angioedema, and anaphylaxis)

Licensed use Some preparations licensed for use in children

Indication and dose

Maintenance of neonatal umbilical arterial catheter

- By intravenous infusion

Neonate 0.5 units/hour

Treatment of thrombotic episodes

- By intravenous administration

Neonate initially 75 units/kg (50 units/kg if under 35 weeks post-menstrual age) by intravenous infusion 25 units/kg/hour, adjusted according to APTT

Child 1 month–1 year initially 75 units/kg by intravenous injection, then by continuous intravenous infusion 25 units/kg/hour, adjusted according to APTT

Child 1–18 years initially 75 units/kg by intravenous injection, then by continuous intravenous infusion 20 units/kg/hour, adjusted according to APTT

- By subcutaneous injection

Child 1 month–18 years 250 units/kg twice daily, adjusted according to APTT

Prophylaxis of thrombotic episodes

- By subcutaneous injection

Child 1 month–18 years 100 units/kg (max. 5000 units) twice daily, adjusted according to APTT

Prevention of clotting in extracorporeal circuits consult product literature

Administration for continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%. Maintenance of neonatal umbilical arterial catheter, dilute 50 units to a final volume of 50 mL with Sodium Chloride 0.45% or use ready-made bag containing 500 units in 500 mL Sodium Chloride 0.9%; infuse at 0.5 mL/hour
Neonatal intensive care (treatment of thrombosis), dilute 1250 units/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 1 mL/hour provides a dose of 25 units/kg/hour

Heparin Sodium (Non-proprietary) (POM)

Injection, heparin sodium 1000 units/mL, net price 1-mL amp = 37p, 5-mL amp = 93p, 5-mL vial = 92p, 10-mL amp = £1.60, 20-mL amp = £2.63; 5000 units/mL, 1-mL amp = 72p, 5-mL amp = £1.87, 5-mL vial = £2.09; 25 000 units/mL, 0.2-mL amp = 92p, 1-mL amp = £1.90, 5-mL vial = £3.68
Excipients may include benzyl alcohol (avoid in neonates, see Excipients, p. 3)

Heparin Calcium (Non-proprietary) (POM)

Injection, heparin calcium 25 000 units/mL, net price 0.2-mL amp = 73p

Low molecular weight heparins

Dalteparin, enoxaparin, and tinzaparin are low molecular weight heparins used for treatment and prophylaxis of thrombotic episodes in children. Their duration of action is longer than that of unfractionated heparin and in adults and older children *once-daily subcutaneous* dosage is sometimes possible; however, younger children require relatively higher doses (possibly due to larger volume of distribution, altered heparin pharmacokinetics, or lower plasma concentrations of antithrombin) and twice daily dosage is sometimes necessary. Low molecular weight heparins are convenient to use, especially in children with poor venous access. Routine monitoring of anti-Factor Xa activity is not usually required except in neonates; monitoring may also be necessary in severely ill children and those with renal or hepatic impairment.

Haemorrhage See under Heparin.

Hepatic impairment Reduce dose in severe hepatic impairment—risk of bleeding may be increased.

Renal impairment See under individual drug.

Pregnancy Not known to be harmful, low molecular weight heparins do not cross the placenta.

Breast-feeding Due to the relatively high molecular weight of these drugs and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturers advise avoid.

DALTEPARIN SODIUM

Cautions see under Heparin and notes above

Hepatic impairment see notes above

Renal impairment risk of bleeding may be increased—dose reduction and monitoring of anti-factor Xa may be required; use of unfractionated heparin may be preferable

Pregnancy see notes above

Breast-feeding see notes above

Contra-indications see under Heparin

Side-effects see under Heparin

Licensed use not licensed for use in children

Indication and dose

Treatment of thrombotic episodes

• By subcutaneous injection

Neonate 100 units/kg twice daily

Child 1 month–12 years 100 units/kg twice daily

Child 12–18 years 200 units/kg (max. 18 000 units) once daily, if increased risk of bleeding reduced to 100 units/kg twice daily

Treatment of venous thromboembolism in pregnancy

• By subcutaneous injection

Child 12–18 years early pregnancy body-weight under 50 kg, 5000 units twice daily; body-weight 50–70 kg, 6000 units twice daily;

body-weight 70–90 kg, 8000 units twice daily; body-weight over 90 kg, 10 000 units twice daily

Prophylaxis of thrombotic episodes

• By subcutaneous injection

Neonate 100 units/kg once daily

Child 1 month–12 years 100 units/kg once daily

Child 12–18 years 2500–5000 units once daily

Fragmin® (Pharmacia) (P_{oM})

Injection (single-dose syringe), dalteparin sodium 12 500 units/mL, net price 2500-unit (0.2-mL) syringe = £1.86; 25 000 units/mL, 5000-unit (0.2-mL) syringe = £2.82, 7500-unit (0.3-mL) syringe = £4.23, 10 000-unit (0.4-mL) syringe = £5.65, 12 500-unit (0.5-mL) syringe = £7.06, 15 000-unit (0.6-mL) syringe = £8.47, 18 000-unit (0.72-mL) syringe = £10.16

Injection, dalteparin sodium 2500 units/mL (for subcutaneous or intravenous use), net price 4-mL (10 000-unit) amp = £5.12; 10 000-units/mL (for subcutaneous or intravenous use), 1-mL (10 000-unit) amp = £5.12; 25 000 units/mL (for subcutaneous use only), 4-mL (100 000-unit) vial = £48.66

Injection (graduated syringe), dalteparin sodium 10 000 units/mL, net price 1-mL (10 000-unit) syringe = £5.65

ENOXAPARIN SODIUM

Cautions see under Heparin and notes above

Hepatic impairment see notes above

Renal impairment risk of bleeding may be increased; reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²; mon-

ENOXAPARIN SODIUM (continued)

itoring of anti-factor Xa may be required; use of unfractionated heparin may be preferable

Pregnancy see notes above

Breast-feeding see notes above

Contra-indications see under Heparin

Side-effects see under Heparin

Licensed use not licensed for use in children

Indication and dose

Treatment of thrombotic episodes

- By subcutaneous injection

Neonate 1.5–2 mg/kg twice daily

Child 1–2 months 1.5 mg/kg twice daily

Child 2 months–18 years 1 mg/kg twice daily

Treatment of venous thromboembolism in pregnancy

- By subcutaneous injection

Child 12–18 years early pregnancy body-weight under 50 kg, 40 mg (4000 units) twice daily; body-weight 50–70 kg, 60 mg (6000 units) twice daily; body-weight 70–90 kg, 80 mg (8000 units) twice daily; body-weight over 90 kg, 100 mg (10 000 units) twice daily

Prophylaxis of thrombotic episodes

- By subcutaneous injection

Neonate 750 micrograms/kg twice daily

Child 1–2 months 750 micrograms/kg twice daily

Child 2 months–18 years 500 micrograms/kg twice daily; max. 40 mg daily

Clexane® (Rhône-Poulenc Rorer) (POM)

Injection, enoxaparin sodium 100 mg/mL, net price 20-mg (0.2-mL, 2000-units) syringe = £3.15, 40-mg (0.4-mL, 4000-units) syringe = £4.20, 60-mg (0.6-mL, 6000-units) syringe = £4.75, 80-mg (0.8-mL, 8000-units) syringe = £5.40, 100-mg (1-mL, 10 000-units) syringe = £6.69, 300-mg (3-mL, 30 000-units) vial (*Clexane® Multi-Dose*) = £22.20; 150 mg/mL (*Clexane® Forte*), 120-mg (0.8-mL, 12 000-units) syringe = £9.77, 150-mg (1-mL, 15 000-units) syringe = £11.10

TINZAPARIN SODIUM

Cautions see under Heparin and notes above

Hepatic impairment see notes above

Renal impairment risk of bleeding may be increased—dose reduction and monitoring of anti-factor Xa may be required; unfractionated heparin may be preferable

Pregnancy see notes above; also vials contain benzyl alcohol—manufacturer advises avoid

Breast-feeding see notes above

Contra-indications see under Heparin

Side-effects see under Heparin

Licensed use not licensed for use in children

Indication and dose

Treatment of thrombotic episodes

- By subcutaneous injection

Child 1–2 months 275 units/kg once daily

Child 2 months–1 year 250 units/kg once daily

Child 1–5 years 240 units/kg once daily

Child 5–10 years 200 units/kg once daily

Child 10–18 years 175 units/kg once daily

Treatment of venous thromboembolism in pregnancy

- By subcutaneous injection

Child 12–18 years 175 units/kg once daily (based on early pregnancy body-weight)

Prophylaxis of thrombotic episodes

- By subcutaneous injection

Child 1 month–18 years 50 units/kg once daily

Innohep® (LEO) (POM)

Injection, tinzaparin sodium 10 000 units/mL, net price 2500-unit (0.25-mL) syringe = £1.98, 3500-unit (0.35-mL) syringe = £2.77, 4500-unit (0.45-mL) syringe = £3.56, 20 000-unit (2-mL) vial = £10.56

Injection, tinzaparin sodium 20 000 units/mL, net price 0.5-mL (10 000-unit) syringe = £8.98, 0.7-mL (14 000-unit) syringe = £12.57, 0.9-mL (18 000-unit) syringe = £16.16, 2-mL (40 000-unit) vial = £34.20

Excipients include benzyl alcohol (in vials) (avoid in neonates, see Excipients, p. 3), sulphites (in 20 000 units/mL vial and syringe)

Heparinoids

Danaparoid is a heparinoid that has a role in children who develop thrombocytopenia in association with heparin, providing they have no evidence of cross-reactivity.

DANAPAROID SODIUM

Cautions recent bleeding or risk of bleeding; concomitant use of drugs that increase risk of bleeding; antibodies to heparins (risk of antibody-induced thrombocytopenia)

Hepatic impairment use with caution in moderate impairment (increased risk of bleeding); avoid in severe impairment unless no alternative

Renal impairment use with caution in moderate impairment; increased risk of bleeding (monitor

⚠ DANAPAROID SODIUM (*continued*)

anti-Factor Xa activity); avoid in severe impairment unless child has heparin-induced thrombocytopenia and no alternative available

Pregnancy limited information available but not known to be harmful—manufacturer advises avoid

Breast-feeding amount probably too small to be harmful but manufacturer advises avoid

Contra-indications haemophilia and other haemorrhagic disorders, thrombocytopenia (unless patient has heparin-induced thrombocytopenia), recent cerebral haemorrhage, severe hypertension, active peptic ulcer (unless this is the reason for operation), diabetic retinopathy, acute bacterial endocarditis, spinal or epidural anaesthesia with treatment doses of danaparoid

Side-effects haemorrhage; hypersensitivity reactions (including rash)

Licensed use not licensed for use in children

Indication and dose

Thromboembolic disease in children with history of heparin-induced thrombocytopenia

- By intravenous administration

Neonate initially 30 units/kg by intravenous injection then by continuous intravenous infusion 1.2–2 units/kg/hour adjusted according to coagulation activity

Child 1 month–16 years initially 30 units/kg (max. 1250 units if bodyweight under 55 kg, 2500 units if over 55 kg) by intravenous injection then by continuous intravenous infusion 1.2–2 units/kg/hour adjusted according to coagulation activity

Child 16–18 years initially 2500 units (1250 units if bodyweight under 55 kg, 3750 units if over 90 kg) by intravenous injection then by continuous intravenous infusion 400 units/hour for 2 hours, then 300 units/hour for 2 hours, then 200 units/hour for 5 days adjusted according to coagulation activity

Administration for intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%

Organon[®] (Organon) (PmI)

Injection, danaparoid sodium 1250 units/mL, net price 0.6-mL amp (750 units) = £29.80

Heparin flushes

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride 0.9% injection is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Heparin Sodium (Non-proprietary) (PmI)

Solution, heparin sodium 10 units/mL, net price 5-mL amp = 25p; 100 units/mL, 2-mL amp = 28p

Excipients may include benzyl alcohol (avoid in neonates, see Excipients, p. 3)

Epoprostenol

Epoprostenol (prostacyclin) can be given to inhibit platelet aggregation during renal dialysis either alone or with heparin. For its use in pulmonary hypertension, see section 2.5.1.2. It is a potent vasodilator and therefore its side-effects include flushing, headache, and hypotension.

2.8.2 Oral anticoagulants

Oral anticoagulants antagonise the effects of vitamin K and take at least 48 to 72 hours for the anticoagulant effect to develop fully; if an immediate effect is required, heparin must be given concomitantly.

Uses Warfarin is the drug of choice for the treatment of systemic thromboembolism in children (not neonates) after initial heparinisation. It may also be used occasionally for the treatment of intravascular or intracardiac thrombi. Warfarin is used prophylactically in those with chronic atrial fibrillation, dilated cardiomyopathy, certain forms of reconstructive heart surgery, mechanical prosthetic heart valves, and some forms of hereditary thrombophilia (e.g. homozygous protein C deficiency).

Heparin or a low molecular weight heparin (section 2.8.1) is usually preferred for the prophylaxis of venous thromboembolism in children undergoing surgery; alternatively warfarin can be continued in selected children currently taking warfarin and who are at a high risk of thromboembolism (seek expert advice).

Dose Whenever possible, the base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

An induction dose is usually given over 4 days (see under Warfarin Sodium below). The subsequent maintenance dose depends on the prothrombin time, reported as INR (international normalised ratio) and should be taken at the same time each day. The following indications and target INRs¹ for **adults** take into account recommendations of the British Society for Haematology²:

- INR 2.5 for treatment of deep-vein thrombosis and pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin), for atrial fibrillation, cardioversion (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR), dilated cardiomyopathy, mural thrombus, symptomatic inherited thrombophilia, coronary artery thrombosis (if anticoagulated), and paroxysmal nocturnal haemoglobinuria;
- INR 3.5 for recurrent deep-vein thrombosis and pulmonary embolism (in patients currently receiving warfarin with INR above 2);
- For mechanical prosthetic heart valves, the recommended target INR depends on the type and location of the valve. Generally, a target INR of 3 is recommended for mechanical aortic valves, and 3.5 for mechanical mitral valves.

Monitoring It is essential that the INR be determined daily or on alternate days in early days of treatment, *then* at longer intervals (depending on response³) *then* up to every 12 weeks.

Haemorrhage The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The following recommendations are based on the result of the INR and whether there is major or minor bleeding; the recommendations (which take into account the recommendations of the British Society for Haematology) apply to **adults** taking warfarin:

- Major bleeding—stop warfarin; give phytonadione (vitamin K₁) 5–10 mg by slow intravenous injection; give prothrombin complex concentrate (factors II, VII, IX, and X) 30–50 units/kg *or* (if no concentrate available) fresh frozen plasma 15 mL/kg
- INR > 8.0, no bleeding or minor bleeding—stop warfarin, restart when INR < 5.0; if there are other risk factors for bleeding give phytonadione (vitamin K₁) 500 micrograms by slow intravenous injection or 5 mg by mouth (for partial reversal of anticoagulation give smaller oral doses of phytonadione e.g. 0.5–2.5 mg using the intravenous preparation orally); repeat dose of phytonadione if INR still too high after 24 hours
- INR 6.0–8.0, no bleeding or minor bleeding—stop warfarin, restart when INR < 5.0
- INR < 6.0 but more than 0.5 units above target value—reduce dose or stop warfarin, restart when INR < 5.0
- Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology

Pregnancy Oral anticoagulants are teratogenic and should not be given in the first trimester of pregnancy. Adolescents at risk of pregnancy should be warned of this danger since stopping warfarin before the sixth week of gestation largely avoids the risk of fetal abnormality. Oral anticoagulants cross the placenta with risk of placental or fetal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, oral anticoagulants should be avoided in pregnancy, especially in the first and third trimesters. Difficult decisions may have to be made, particularly in those with prosthetic heart valves

1. An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.

2. Guidelines on Oral Anticoagulation (warfarin): third edition—2005 update. *Br J Haematol* 2005; 132: 277–285.

3. Change in child's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. See also **interactions**, Appendix 1 (warfarin). Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect warfarin control.

or with a history of recurrent venous thrombosis, pulmonary embolism, or atrial fibrillation.

Babies of mothers taking warfarin at the time of delivery need to be offered immediate prophylaxis with at least 100 micrograms/kg of intramuscular phytonadione (vitamin K₁), see section 9.6.6.

Dietary differences Infant formula is supplemented with vitamin K, which makes formula-fed infants resistant to warfarin; they may therefore need higher doses. In contrast breast milk contains low concentrations of vitamin K making breast-fed infants more sensitive to warfarin.

Treatment booklets Anticoagulant treatment booklets should be issued to children or their carers, and are available for distribution to local healthcare professionals from Health Authorities and from:

3M Security Printing and Systems Limited

Gorse Street

Chadderton

Oldham, OL9 9QH.

Tel: 0845 610 1112

nhsforms@spsl.uk.com

These booklets include advice for children or their carers on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. Electronic copies are also available at www.npsa.nhs.uk/nrls/alerts-and-directives/alerts/anticoagulant.

WARFARIN SODIUM

Cautions see notes above; also recent surgery; concomitant use of drugs that increase risk of bleeding; bacterial endocarditis (increased risk of bleeding; use only if warfarin otherwise indicated); **interactions:** Appendix 1 (warfarin)

Hepatic impairment avoid in severe impairment, especially if prothrombin time already prolonged

Renal impairment use with caution (avoid in severe impairment)

Breast-feeding not excreted in breast milk; no evidence of harm

Contra-indications peptic ulcer, severe hypertension

Pregnancy see notes above

Side-effects haemorrhage—see notes above; other side-effects reported include hypersensitivity, rash, alopecia, diarrhoea, unexplained drop in haematocrit, 'purple toes', skin necrosis, jaundice, hepatic dysfunction; also nausea, vomiting, and pancreatitis

Licensed use not licensed for use in children

Indication and dose

Treatment and prophylaxis of thrombotic episodes

- By mouth

Neonate (under specialist advice) 200 micrograms/kg as a single dose on first day, reduced to 100 micrograms/kg once daily for following 3 days (but if INR still below 1.4 use 200 micrograms/kg once daily, or if INR above 3 use

50 micrograms/kg once daily, if INR above 3.5 omit dose); then adjusted according to INR, usual maintenance 100–300 micrograms/kg once daily (may need up to 400 micrograms/kg once daily especially if bottle fed—see notes above)

Child 1 month–18 years 200 micrograms/kg (max. 10 mg) as a single dose on first day, reduced to 100 micrograms/kg (max. 5 mg) once daily for following 3 days (but if INR still below 1.4 use 200 micrograms/kg (max. 10 mg) once daily, or if INR above 3 use 50 micrograms/kg (max. 2.5 mg) once daily, or if INR above 3.5 omit dose); then adjusted according to INR, usual maintenance 100–300 micrograms/kg once daily (may need up to 400 micrograms/kg once daily especially if bottle fed—see notes above)

Note Induction dose may need to be altered according to condition (e.g. abnormal liver function tests, cardiac failure), concomitant interacting drugs, and if baseline INR above 1.3

Warfarin (Non-proprietary) ^(P)

Tablets, warfarin sodium 500 micrograms (white), net price 28-tab pack = 93p; 1 mg (brown), 28 = £1.03; 3 mg (blue), 28 = £1.14; 5 mg (pink), 28 = £1.24. Label: 10, anticoagulant card
Brands include *Marevan*®

- ▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

2.8.3 Protamine sulphate

Protamine sulphate is used to treat overdosage of heparin and low molecular weight heparins. The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulphate; the effects of low molecular weight heparins can persist for up to 24 hours after administration. Excessive doses of protamine sulphate can have an anticoagulant effect.

PROTAMINE SULPHATE

(Protamine Sulfate)

Cautions see above; also monitor activated partial thromboplastin time or other appropriate blood clotting parameters; if increased risk of allergic reaction to protamine (includes previous treatment with protamine or protamine insulin, allergy to fish, and adolescent males who are infertile)

Side-effects nausea, vomiting, lassitude, flushing, hypotension, hypertension, bradycardia, dyspnoea, rebound bleeding, back pain; hypersensitivity reactions (including angioedema, anaphylaxis) and pulmonary oedema reported

Indication and dose**Overdosage with intravenous injection or intravenous infusion of heparin**

- By intravenous injection (rate not exceeding 5 mg/minute)

Child 1 month–18 years to neutralise each 100 units of unfractionated heparin, 1 mg if less than 30 minutes lapsed since overdose, 500–750 micrograms if 30–60 minutes lapsed, 375–500 micrograms if 60–120 minutes lapsed, 250–375 micrograms if over 120 minutes lapsed; max. 50 mg

Overdosage with subcutaneous injection of heparin

- By intravenous injection and intravenous infusion

Child 1 month–18 years 1 mg neutralises approx. 100 units of unfractionated heparin; give 50–100% of the total dose by intravenous injection (rate not exceeding 5 mg/minute), then give any remainder of dose by intravenous infusion over 8–16 hours; max. total dose 50 mg

Overdosage with subcutaneous injection of low molecular weight heparin

- By intermittent intravenous injection (rate not exceeding 5 mg/minute) or by continuous intravenous infusion

Child 1 month–18 years 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); max. 50 mg

Administration may be diluted if necessary with Sodium Chloride 0.9%

Protamine Sulphate (Non-proprietary) (POM)

Injection, protamine sulphate 10 mg/mL, net price 5-mL amp = £1.14, 10-mL amp = £4.15

Prosulf[®] (CP) (POM)

Injection, protamine sulphate 10 mg/mL, net price 5-mL amp = 96p (glass), £1.20 (polypropylene)

2.9 Antiplatelet drugs

Antiplatelet drugs decrease platelet aggregation and may inhibit thrombus formation in the arterial circulation, where anticoagulants have little effect.

Aspirin has limited use in children because it has been associated with Reye's syndrome. The CSM has advised that aspirin-containing preparations should not be given to children and adolescents under 16 years, unless specifically indicated, such as for Kawasaki syndrome (see below), for prophylaxis of clot formation after cardiac surgery, or for prophylaxis of stroke in children at high risk.

If aspirin causes dyspepsia, or if the child is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor (section 1.3.5) or a H₂-receptor antagonist (section 1.3.1) can be added.

Dipyridamole is also used as an antiplatelet drug to prevent clot formation after cardiac surgery and may be used with specialist advice for treatment of persistent coronary artery aneurysms in Kawasaki syndrome.

Kawasaki syndrome Initial treatment is with high-dose aspirin and a single dose of intravenous normal immunoglobulin (p. 757); this combination has an additive anti-inflammatory effect resulting in faster resolution of fever and a decreased incidence of coronary artery complications. After the acute phase, when the patient is afebrile, aspirin is continued at a lower dose to prevent coronary artery abnormalities.

ASPIRIN (antiplatelet)

(Acetylsalicylic Acid)

Cautions asthma; uncontrolled hypertension; previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration); concomitant use of drugs that increase risk of bleeding; G6PD deficiency (section 9.1.5); **interactions:** Appendix 1 (aspirin)

Hepatic impairment avoid in severe impairment—increased risk of gastro-intestinal bleeding

Renal impairment use with caution (avoid in severe impairment); sodium and water retention; deterioration in renal function; increased risk of gastro-intestinal bleeding

Pregnancy use with caution during third trimester; impaired platelet function and risk of

◊ ASPIRIN (antiplatelet) (continued)

haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); with high doses, closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of newborn; kernicterus in jaundiced neonates

Contra-indications children under 16 years (risk of Reye's syndrome) unless for indications below; active peptic ulceration; haemophilia and other bleeding disorders

Hypersensitivity Aspirin and other NSAIDs are **contra-indicated** in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID

Breast-feeding avoid—possible risk of Reye's syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low

Side-effects bronchospasm; gastro-intestinal haemorrhage (occasionally major), also other haemorrhage (e.g. subconjunctival)

Licensed use Not licensed for use in children under 16 years

Indication and dose

Kawasaki syndrome

• By mouth

Neonate initially 8 mg/kg 4 times daily for 2 weeks or until afebrile, followed by 5 mg/kg once daily for 6–8 weeks; if no evidence of coronary lesions after 8 weeks, discontinue treatment or seek expert advice

Child 1 month–12 years initially 7.5–12.5 mg/kg 4 times daily for 2 weeks or until afebrile, then 2–5 mg/kg once daily for 6–8 weeks; if no evidence of coronary lesions after 8 weeks, discontinue treatment or seek expert advice

Antiplatelet, prevention of thrombus formation after cardiac surgery

• By mouth

Neonate 1–5 mg/kg once daily

Child 1 month–12 years 1–5 mg/kg (usual max. 75 mg) once daily

Child 12–18 years 75 mg once daily

Aspirin (Non-proprietary) (POM)

Dispersible tablets, aspirin 75 mg, net price 28 = 83p; 300 mg, 100-tab pack = £4.93 Label: 13, 21, 32

Tablets, e/c, aspirin 75 mg, net price 28-tab pack = 83p; 56-tab pack = £1.08; 300 mg, 100-tab pack = £4.74. Label: 5, 25, 32
Brands include *Micropirin*®

Suppositories, available from 'special-order' manufacturers or specialist importing companies, see p. 943

Angettes 75® (Bristol-Myers Squibb)

Tablets, aspirin 75 mg, net price 28-tab pack = 94p. Label: 32

Caprin® (Pinewood) (POM)

Tablets, e/c, pink, aspirin 75 mg, net price 28-tab pack = £1.55, 56-tab pack = £3.08, 100-tab pack = £5.24; 300 mg, 100-tab pack = £4.89. Label: 5, 25, 32

Nu-Seals® Aspirin (Alliance) (POM)

Tablets, e/c, aspirin 75 mg, net price 56-tab pack = £2.60; 300 mg, 100-tab pack = £3.46. Label: 5, 25, 32

DIPYRIDAMOLE

Cautions aortic stenosis, left ventricular outflow obstruction, heart failure; may exacerbate migraine; hypotension; myasthenia gravis (risk of exacerbation); concomitant use of drugs that increase risk of bleeding; coagulation disorders; **interactions:** Appendix 1 (dipyridamole)

Pregnancy not known to be harmful

Breast-feeding small amount present in milk—manufacturer advises caution

Side-effects gastro-intestinal effects, dizziness, myalgia, throbbing headache, hypotension, hot flushes and tachycardia; hypersensitivity reactions such as rash, urticaria, severe bronchospasm and angioedema; increased bleeding during or after surgery; thrombocytopenia reported

Licensed use Not licensed for use in children

Indication and dose

Kawasaki syndrome

• By mouth

Child 1 month–12 years 1 mg/kg 3 times daily

Prevention of thrombus formation after cardiac surgery

• By mouth

Child 1 month–12 years 2.5 mg/kg twice daily

Child 12–18 years 100–200 mg 3 times daily

Administration Injection solution can be given orally

Dipyridamole (Non-proprietary) (POM)

Tablets, coated, dipyridamole 25 mg, net price 84 = £4.28; 100 mg, 84 = £3.19. Label: 22

Oral suspension, dipyridamole 50 mg/5 mL, net price 150 mL = £37.00

Persantin® (Boehringer Ingelheim) (POM)

Tablets, both s/c, dipyridamole 25 mg (orange), net price 84-tab pack = £1.57; 100 mg, 84-tab pack = £4.38. Label: 22

Injection, dipyridamole 5 mg/mL, net price 2-mL amp = 11p

2.10 Myocardial infarction and fibrinolysis

2.10.1 Management of myocardial infarction

2.10.2 Fibrinolytic drugs

2.10.1 Management of myocardial infarction

Classification not used in *BNF for Children*.

2.10.2 Fibrinolytic drugs

Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.

Alteplase, streptokinase, and urokinase are used in children to dissolve intravascular thrombi and unblock occluded arteriovenous shunts, catheters, and indwelling central lines blocked with fibrin clots. Treatment should be started as soon as possible after a clot has formed and discontinued once a pulse in the affected limb is detected, or the shunt or catheter unblocked.

The safety and efficacy of treatment remains uncertain, especially in neonates. A fibrinolytic drug is probably only appropriate where arterial occlusion threatens ischaemic damage; an anticoagulant may stop the clot getting bigger. Alteplase is the preferred fibrinolytic in children and neonates; there is less risk of adverse effects including allergic reactions.

Cautions Thrombolytic drugs should be used with caution if there is a risk of bleeding including that from venepuncture or invasive procedures. They should also be used with caution in external chest compression, pregnancy (see individual drugs), hypertension, other conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation), and recent or concurrent use of drugs that increase the risk of bleeding.

Contra-indications Thrombolytic drugs are contra-indicated in recent haemorrhage, trauma, or surgery (including dental extraction), coagulation defects, bleeding diatheses, aortic dissection, aneurysm, coma, history of cerebrovascular disease especially recent events or with any residual disability, recent symptoms of possible peptic ulceration, heavy vaginal bleeding, severe hypertension, active pulmonary disease with cavitation, acute pancreatitis, pericarditis, bacterial endocarditis, severe liver disease, and oesophageal varices; also in the case of streptokinase, previous allergic reactions to streptokinase.

Prolonged persistence of antibodies to streptokinase can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration. Streptokinase should also be avoided in children who have had streptococcal infection in the last 12 months.

Side-effects Side-effects of thrombolytics are mainly bleeding, nausea, and vomiting. Reperfusion can cause cerebral and pulmonary oedema. Hypotension can also occur and can usually be controlled by elevating the patient's legs, or by reducing the rate of infusion or stopping it temporarily. Back pain, fever, and convulsions have been reported. Bleeding is usually limited to the site of injection, but intracerebral haemorrhage or bleeding from other sites can occur. Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid). Thrombolytics can cause allergic reactions (including rash, flushing and uveitis) and anaphylaxis has been reported (for details of management see Allergic Emergencies, section 3.4.3). Guillain-Barré syndrome has been reported rarely after streptokinase treatment.

ALTEPLASE

(rt-PA, tissue-type plasminogen activator)

Cautions see notes above; in children who have had an *acute stroke*, monitor for intracranial haemorrhage and monitor blood pressure

Hepatic impairment avoid in severe impairment—increased risk of bleeding

Pregnancy no evidence of teratogenicity; possibility of premature separation of placenta in first 18 weeks; risk of maternal haemorrhage throughout pregnancy and during post-partum use; theoretical risk of fetal haemorrhage throughout pregnancy

▢ ALTEPLASE (continued)

Contra-indications see notes above; in children who have had an *acute stroke*, convulsion accompanying stroke, severe stroke, history of stroke in children with diabetes, stroke in last 3 months, hypoglycaemia, hyperglycaemia

Side-effects see notes above; also risk of cerebral bleeding increased in acute stroke

Licensed use Not licensed for use in children

Indication and dose

Intravascular thrombosis doses may vary—consult local guidelines

- By intravenous infusion

Neonate 100–500 micrograms/kg/hour for 3–6 hours; use ultrasound assessment to monitor effect before considering a second course of treatment

Child 1 month–18 years 100–500 micrograms/kg/hour for 3–6 hours; max. 100 mg total daily dose; use ultrasound assessment to monitor effect before considering a second course of treatment

Administration dissolve in Water for Injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute further in Sodium Chloride 0.9% to a concentration of not less than 200 micrograms/mL; not to be diluted in Glucose

Occluded arteriovenous shunts, catheters, and indwelling central lines

- By injection direct into catheter or central line

Child 1 month–18 years using 1 mg/mL solution, instill up to 2 mL according to dead-space of catheter or central line; aspirate lysate after 4 hours; flush with sodium chloride 0.9% injection

Actilyse® (Boehringer Ingelheim) (POM)

Injection, powder for reconstitution, alteplase 10 mg (5.8 million units)/vial, net price per vial (with diluent) = £135.00; 20 mg (11.6 million units)/vial (with diluent and transfer device) = £180.00; 50 mg (29 million units)/vial (with diluent, transfer device, and infusion bag) = £300.00

STREPTOKINASE

Cautions see notes above

Hepatic impairment avoid in severe hepatic impairment—increased risk of bleeding

Pregnancy possibility of premature separation of placenta in first 18 weeks; risk of maternal haemorrhage throughout pregnancy and during post-partum use; theoretical risk of fetal haemorrhage throughout pregnancy

Contra-indications see notes above

Side-effects see notes above

Licensed use Licensed for use in children for intravascular dissolution of thrombi and emboli

Indication and dose

Intravascular thrombosis

- By intravenous infusion

Child 1 month–12 years initially 2500–4000 units/kg over 30 minutes, followed

by *continuous intravenous infusion* of 500–1000 units/kg/hour for up to 3 days until reperfusion occurs

Child 12–18 years initially 250 000 units over 30 minutes, followed by *continuous intravenous infusion* of 100 000 units/hour for up to 3 days until reperfusion occurs

Administration May be diluted with Glucose 5% or Sodium Chloride 0.9% after reconstitution. Monitor fibrinogen concentration closely; if fibrinogen concentration less than 1g/litre, stop streptokinase infusion and start heparin; restart streptokinase once fibrinogen concentration reaches 1g/litre

Streptase® (CSL Behring) (POM)

Injection, powder for reconstitution, streptokinase, net price 250 000-unit vial = £15.91; 750 000-unit vial = £41.72; 1.5 million-unit vial = £83.44 (hosp. only)

UROKINASE

Cautions see notes above

Hepatic impairment avoid in severe hepatic impairment—increased risk of bleeding

Pregnancy possibility of premature separation of placenta; risk of maternal haemorrhage throughout pregnancy and during post-partum use; theoretical risk of fetal haemorrhage throughout pregnancy

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children

Indication and dose

Intravascular thrombosis

- By intravenous injection and infusion

Neonate 4400 units/kg as a single dose by *intravenous injection* in 15 mL diluent, followed

by 4400 units/kg/hour by *intravenous infusion* for 6–12 hours, adjusted according to response

Child 1 month–18 years 4400 units/kg as a single dose by *intravenous injection* in 15 mL diluent, followed by 4400 units/kg/hour by *intravenous infusion* for 6–12 hours, adjusted according to response

Administration May be diluted, after reconstitution, with Sodium Chloride 0.9%

Occluded arteriovenous shunts, catheters, and indwelling central lines

- By injection directly into catheter or central line

Neonate 5000–10 000 units in sodium chloride 0.9% to fill catheter dead-space **only**; leave for 2–4 hours then aspirate the lysate; flush with heparinised saline

UROKINASE (continued)

Child 1 month–18 years 5000–10 000 units in sodium chloride 0.9% to fill catheter dead-space only; leave for 2–4 hours then aspirate the lysate; flush with heparinised saline

Syner-KINASE® (Syner-Med) (POM)

Injection, powder for reconstitution, urokinase, net price 25 000-unit vial = £45.95; 100 000-unit vial = £112.95

Note 10 000-unit vial, 50 000-unit vial, and 250 000-unit vial also available from 'special-order' manufacturers or specialist importing companies, see p. 943

2.11 Antifibrinolytic drugs and haemostatics

Fibrin dissolution can be impaired by the administration of **tranexamic acid**, which inhibits fibrinolysis. It can be used to prevent bleeding or treat bleeding associated with excessive fibrinolysis (e.g. in prostatectomy, bladder surgery, in dental extraction in children with haemophilia, and in traumatic hyphaema) and in the management of menorrhagia. Tranexamic acid may also be used in hereditary angioedema, epistaxis, and thrombolytic overdose.

Desmopressin (section 6.5.2) is used in the management of mild to moderate haemophilia and von Willebrands' disease. It is also used for testing fibrinolytic response.

TRANEXAMIC ACID

Cautions massive haematuria (avoid if risk of ureteric obstruction); not for use in disseminated intravascular coagulation; irregular menstrual bleeding (establish cause before initiating therapy); regular liver function tests in long-term treatment of hereditary angioedema

Renal impairment manufacturer advises reduce dose in mild to moderate renal impairment; avoid in severe renal impairment

Pregnancy no evidence of teratogenicity in animal studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta

Breast-feeding small amount present in milk—antifibrinolytic effect in infant unlikely

Contra-indications thromboembolic disease

Side-effects nausea, vomiting, diarrhoea (reduce dose); rarely disturbances in colour vision (discontinue), thromboembolic events, allergic skin reactions; giddiness and hypotension on rapid intravenous injection

Licensed use Licensed for inhibition of fibrinolysis

Indication and dose

Inhibition of fibrinolysis, hereditary angioedema (section 3.4.3)

• By mouth

Child 1 month–18 years 15–25 mg/kg (max. 1.5 g) 2–3 times daily

• By intravenous injection over at least 10 minutes

Child 1 month–18 years 10 mg/kg (max. 1 g) 2–3 times daily

• By continuous intravenous infusion

Child 1 month–18 years 45 mg/kg over 24 hours

Prevention of excessive bleeding after dental procedures (e.g. in haemophilia)

• By intravenous injection (pre-operatively) and by mouth (post-operatively)

Child 6–18 years 10 mg/kg (max. 1.5 g) by intravenous injection pre-operatively, followed by 15–25 mg/kg (max. 1.5 g) 2–3 times daily by mouth for up to 8 days

• Mouthwash 5% solution (specialist use only)

Child 6–18 years rinse mouth with 5–10 mL 4 times daily for 2 days; not to be swallowed
Note Mouthwash available only as extemporaneously prepared preparation, see Extemporaneous Preparations, p. 8

Menorrhagia

• By mouth

Child 12–18 years 1 g 3–4 times daily for up to 4 days; max. 4 g daily (initiate when menstruation has started)

Administration For intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%

Tranexamic acid (Non-proprietary) (POM)

Tablets, tranexamic acid 500 mg, net price 60-tab pack = £7.80

Cyklokapron® (Meda) (POM)

Tablets, f/c, scored, tranexamic acid 500 mg, net price 60-tab pack = £14.30

Cyklokapron® (Pfizer) (POM)

Injection, tranexamic acid 100 mg/mL, net price 5-mL amp = £1.55

Blood products

Classification not used in *BNF for Children*.

2.12 Lipid-regulating drugs

Atherosclerosis begins in childhood and raised serum-cholesterol in children is associated with cardiovascular disease in adulthood. Lowering the cholesterol, without hindering growth and development in children and adolescents, should reduce the risk of cardiovascular disease in later life.

The risk factors for developing cardiovascular disease include raised serum cholesterol concentration, smoking, hypertension, impaired glucose tolerance, male sex, ethnicity, obesity, triglyceride concentration, chronic kidney disease, and a family history of cardiovascular disease. In children with heterozygous familial hypercholesterolaemia, the family history of cardiovascular disease is most important when considering initiation of a lipid-regulating drug. Homozygous familial hypercholesterolaemia is rare and requires specialist management.

Secondary causes of hypercholesterolaemia should be addressed, these include diet, diabetes mellitus, hypothyroidism (see below), nephrotic syndrome, obstructive biliary disease, glycogen storage disease, and drugs such as corticosteroids.

Treatment Dietary intervention is the mainstay of treatment of hypercholesterolaemia in children. The aim is to reduce the risk of atherosclerosis whilst ensuring adequate growth and development. Advice should also be given on lifestyle measures (e.g. increased exercise, and if appropriate, stopping smoking). Blood pressure should also be reduced if required (section 2.5).

When 6–12 months of dietary intervention alone has failed, drug therapy is indicated in children 10 years and over (rarely necessary in younger children) who are at a high risk of developing cardiovascular disease. Dietary therapy and lifestyle measures should continue even if lipid-regulating drugs have been introduced.

Lipid-regulating drugs are considered if dietary intervention fails to reduce total serum-cholesterol adequately; experience of their use in children is limited and they should be initiated on specialist advice.

Statins (**atorvastatin**, **pravastatin**, and **simvastatin**) are generally well tolerated; atorvastatin and simvastatin are considered to be the drugs of first choice. **Bile acid sequestrants** are also available but tolerability of and compliance with these drugs is poor, and their use is declining.

Evidence for the use of a **fibrate** (**bezafibrate** or **fenofibrate**) in children is limited; fibrates should be considered only if dietary intervention and treatment with a statin and a bile acid sequestrant is unsuccessful or contra-indicated.

In hypertriglyceridaemia which cannot be controlled by very strict diet, omega-3 fatty acid compounds can be considered.

Hypothyroidism Children with hypothyroidism should receive adequate thyroid replacement therapy before their requirement for lipid-regulating treatment is assessed because correction of hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid-regulating drugs.

CSM advice (muscle effects)

The CSM has advised that rhabdomyolysis associated with lipid-regulating drugs such as the fibrates and statins appears to be rare (approx. 1 case in every 100 000 treatment years) but may be increased in those with renal impairment and possibly in those with hypothyroidism (see also notes above). Concomitant treatment with drugs that increase plasma-statin concentration increase the risk of muscle toxicity; concomitant treatment with a fibrate and a statin may also be associated with an increased risk of serious muscle toxicity.

Statins

The statins (**atorvastatin**, **pravastatin**, and **simvastatin**) competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver. They are more effective

than other classes of drugs in lowering LDL-cholesterol but less effective than the fibrates in reducing triglycerides. Statins also increase concentrations of HDL-cholesterol.

Statins reduce cardiovascular disease events and total mortality in adults, irrespective of the initial cholesterol concentration.

Cautions Statins should be used with caution in those with a history of liver disease or with a high alcohol intake (use should be avoided in active liver disease). Hypothyroidism should be managed adequately before starting treatment with a statin (see p. 159). Liver-function tests should be carried out before and within 1–3 months of starting treatment and thereafter at intervals of 6 months for 1 year, unless indicated sooner by signs or symptoms suggestive of hepatotoxicity. Treatment should be discontinued if serum transaminase concentration rises to, and persists at, 3 times the upper limit of the reference range. Statins should be used with caution in those with risk factors for myopathy or rhabdomyolysis; children or their carers should be advised to report unexplained muscle pain (see Muscle Effects below). Statins should be avoided in acute porphyria (section 9.8.2). **Interactions:** Appendix 1 (statins)

Contra-indications Statins are contra-indicated in active liver disease (or persistently abnormal liver function tests), in pregnancy (adequate contraception required during treatment and for 1 month afterwards), and during breast-feeding.

Side-effects Statins can cause various muscular side-effects, including myositis, which can lead to rhabdomyolysis. Muscular effects are rare but often significant (see below and CSM advice (Muscle effects), p. 159). Statins can cause gastrointestinal disturbances, and very rarely pancreatitis. They can also cause altered liver function tests, and rarely hepatitis and jaundice; hepatic failure has been reported very rarely. Other side-effects include sleep disturbance, headache, dizziness, depression, paraesthesia, hypoaesthesia, asthenia, peripheral neuropathy, amnesia, fatigue, sexual dysfunction, thrombocytopenia, arthralgia, visual disturbance, alopecia, and hypersensitivity reactions (including rash, pruritus, urticaria, and very rarely lupus erythematosus-like reactions). In very rare cases statins can cause interstitial lung disease; if patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.

Muscle effects Myalgia, myositis, and myopathy have been reported with the statins; if myopathy is suspected and creatine kinase is markedly elevated (more than 5 times upper limit of normal), treatment should be discontinued; in children at high risk of muscle effects, a statin should not be started if creatine kinase is elevated. Children at high risk of myopathy include those with a personal or family history of muscular disorders, previous history of muscular toxicity or liver disease (see also CSM advice, p. 159). There is also an increased incidence of myopathy if the statins are given with a fibrate, with lipid-lowering doses of nicotinic acid, or with immunosuppressants such as ciclosporin; close monitoring of liver function and, if symptomatic, of creatine kinase is required in patients receiving these drugs. Rhabdomyolysis with acute renal impairment secondary to myoglobinuria has also been reported.

Counselling Advise children or their carers to report promptly unexplained muscle pain, tenderness, or weakness.

ATORVASTATIN

Cautions see notes above; also haemorrhagic stroke

Hepatic impairment avoid in active liver disease or unexplained persistent elevations in serum transaminases

Contra-indications see notes above

Pregnancy avoid—congenital anomalies reported; decreased synthesis of cholesterol possibly affects fetal development

Breast-feeding manufacturer advises avoid—no information available

Side-effects see notes above; also chest pain; back pain; pruritus; *less commonly* anorexia, malaise, weight gain, hypoglycaemia, hyperglycaemia, and tinnitus; *rarely* cholestatic jaundice and peripheral oedema; *very rarely* taste distur-

bances, gynaecomastia, hearing loss, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Indication and dose

Hyperlipidaemia including familial hypercholesterolaemia

• By mouth

Child 10–17 years initially 10 mg once daily, increased if necessary, at intervals of at least 4 weeks to usual max. 20 mg once daily

Child 17–18 years initially 10 mg once daily, increased if necessary, at intervals of at least 4 weeks to max. 80 mg once daily

Note Reduced dose required with concomitant ciclosporin, clarithromycin, or itraconazole—seek specialist advice

▢ ATORVASTATIN (continued)

Lipitor[®] (Pfizer) (POM)

Tablets, all f/c, atorvastatin (as calcium trihydrate)
10 mg, net price 28-tab pack = £18.03; 20 mg, 28-

tab pack = £24.64; 40 mg, 28-tab pack = £28.21;
80 mg, 28-tab pack = £28.21. Counselling, muscle
effects, see notes above

PRAVASTATIN SODIUM

Cautions see notes above

Hepatic impairment avoid in active liver disease or unexplained persistent elevations in serum transaminases

Renal impairment start with lower doses in moderate to severe impairment

Contra-indications see notes above

Pregnancy avoid—congenital anomalies reported; decreased synthesis of cholesterol possibly affects fetal development

Breast-feeding small amounts present in breast milk—manufacturer advises avoid

Side-effects see notes above; *less commonly* abnormal urination (including dysuria, nocturia, and frequency); *very rarely* fulminant hepatic necrosis

Licensed use licensed in children over 8 years for familial hypercholesterolaemia

Indication and dose

Hyperlipidaemia including familial hypercholesterolaemia

• **By mouth**

Child 8–14 years 10 mg once daily at night, adjusted at intervals of at least 4 weeks to max. 20 mg once daily at night

Child 14–18 years 10 mg once daily at night, adjusted at intervals of at least 4 weeks to max. 40 mg once daily at night

Pravastatin (Non-proprietary) (POM)

Tablets, pravastatin sodium 10 mg, net price 28-tab pack = £1.73; 20 mg, 28-tab pack = £2.22; 40 mg, 28-tab pack = £2.77

Counselling muscle effects, see notes above

Lipostat[®] (Squibb) (POM)

Tablets, all yellow, pravastatin sodium 10 mg, net price 28-tab pack = £15.05; 20 mg, 28-tab pack = £27.61; 40 mg, 28-tab pack = £27.61. Counselling, muscle effects, see notes above

SIMVASTATIN

Cautions see notes above

Hepatic impairment avoid in active liver disease or unexplained persistent elevations in serum transaminases

Renal impairment doses above 5 mg daily (10 mg daily in children over 10 years) should be used with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Contra-indications see notes above

Pregnancy avoid—congenital anomalies reported; decreased synthesis of cholesterol possibly affects fetal development

Breast-feeding manufacturer advises avoid—no information available

Side-effects see notes above; also *rarely* anaemia

Licensed use not licensed for use in children

Indication and dose

Hyperlipidaemia including familial hypercholesterolaemia

• **By mouth**

Child 5–10 years initially 5 mg at night increased, if necessary, at intervals of at least 4 weeks to max. 20 mg at night

Child 10–18 years initially 10 mg at night increased, if necessary, at intervals of at least 4 weeks to max. 40 mg at night

Note Reduced dose required with concomitant ciclosporin, danazol, fibrates, amiodarone, diltiazem, or verapamil—seek specialist advice

Simvastatin (Non-proprietary) (POM)

Tablets, simvastatin 10 mg, net price 28-tab pack = 85p; 20 mg, 28-tab pack = 95p; 40 mg, 28-tab pack = £1.37; 80 mg, 28-tab pack = £2.94. Counselling, muscle effects, see notes above

Brands include *Simvador*[®]

Zocor[®] (MSD) (POM)

Tablets, all f/c, simvastatin 10 mg (peach), net price 28-tab pack = £18.03; 20 mg (tan), 28-tab pack = £29.69; 40 mg (red), 28-tab pack = £29.69; 80 mg (red), 28-tab pack = £29.69. Counselling, muscle effects, see notes above

Bile acid sequestrants

Colestyramine (cholestyramine) and **colestipol** are bile acid sequestrants used in the management of hypercholesterolaemia. They act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma. Thus both com-

pounds effectively reduce LDL-cholesterol but can aggravate hypertriglyceridaemia. Bile acid sequestrants are not well tolerated and compliance with treatment is poor, therefore they are rarely used in children.

Cautions Bile acid sequestrants interfere with the absorption of fat-soluble vitamins; supplements of vitamins A, D and K may be required when treatment is prolonged and the child's growth and development should be monitored. **Interactions:** Appendix 1 (bile acid sequestrants).

Side-effects As bile acid sequestrants are not absorbed, gastro-intestinal side-effects predominate. Constipation is common, but diarrhoea has occurred, as have nausea, vomiting, and gastro-intestinal discomfort. Hypertriglyceridaemia may be aggravated. An increased bleeding tendency has been reported due to hypoprotrombinaemia associated with vitamin K deficiency.

Counselling Other drugs should be taken at least 1 hour before or 4–6 hours after bile acid sequestrants to reduce possible interference with absorption.

COLESTYRAMINE

(Cholestyramine)

Cautions see notes above

Hepatic impairment interferes with absorption of fat-soluble vitamins and may aggravate mal-absorption in primary biliary cirrhosis; likely to be ineffective in complete biliary obstruction

Pregnancy use with caution—drug not absorbed but may cause fat soluble vitamin deficiency on prolonged use

Breast-feeding use with caution—drug not absorbed but may cause fat soluble vitamin deficiency on prolonged use

Contra-indications complete biliary obstruction (not likely to be effective)

Side-effects see notes above; intestinal obstruction reported rarely and hyperchloraemic acidosis reported on prolonged use

Licensed use licensed in children over 6 years to reduce cholesterol; see also section 1.9.2

Indication and dose

Familial hypercholesterolaemia

- By mouth

Child 6–12 years initially 4 g once daily increased to 4 g up to 3 times daily according to response

Child 12–18 years initially 4 g once daily increased by 4 g at weekly intervals to 12–24 g daily in 1–4 divided doses, then adjusted according to response; max. 36 g daily

Cholestatic pruritus section 1.9.2

Diarrhoea section 1.9.2

Administration The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content; total daily dose may be given as a single dose if tolerated

Colestyramine (Non-proprietary) (P_{MI})

Powder, sugar-free, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £18.20.

Label: 13, counselling, avoid other drugs at same time (see notes above)

Excipients may include aspartame (section 9.4.1)

Questran® (Bristol-Myers Squibb) (P_{MI})

Powder, sugar-free, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £11.42. Label: 13, counselling, avoid other drugs at same time (see notes above)

Excipients include sucrose 3.79g/sachet

Questran Light® (Bristol-Myers Squibb) (P_{MI})

Powder, sugar-free, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £16.99.

Label: 13, counselling, avoid other drugs at same time (see notes above)

Excipients include aspartame (section 9.4.1)

COLESTIPOL HYDROCHLORIDE

Cautions see notes above

Pregnancy use with caution—drug not absorbed but may cause fat soluble vitamin deficiency on prolonged use

Breast-feeding use with caution—drug not absorbed but may cause fat soluble vitamin deficiency on prolonged use

Side-effects see notes above

Licensed use not licensed for use in children

Indication and dose

Familial hypercholesterolaemia

- By mouth

Child 12–18 years initially 5 g 1–2 times daily increased if necessary in 5-g increments at intervals of 1 month to max. of 30 g daily in 1–2 divided doses

Administration The contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, cereals, yoghurt, and pulpy fruits with a high moisture content; total daily dose may be given as a single dose if tolerated

◊ COLESTIPOL HYDROCHLORIDE (continued)

Colestid® (Pharmacia) (POM)

Granules, yellow, colestipol hydrochloride 5 g/sachet, net price 30 sachets = £15.05. Label: 13, counselling, avoid other drugs at same time (see notes above)

Colestid Orange, granules, yellow/orange, colestipol hydrochloride 5 g/sachet, with aspartame, net price 30 sachets = £15.05. Label: 13, counselling, avoid other drugs at same time (see notes above)

Ezetimibe

Ezetimibe inhibits the intestinal absorption of cholesterol. It is given in combination with a statin or alone if a statin is inappropriate. If ezetimibe is used in combination with a statin, there is an increased risk of rhabdomyolysis (see also CSM advice on p. 159).

EZETIMIBE

Cautions interactions: Appendix 1 (ezetimibe)

Hepatic impairment avoid in moderate and severe impairment—may accumulate

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Contra-indications

Breast-feeding present in milk in *animal* studies—manufacturer advises avoid

Side-effects gastro-intestinal disturbances; headache, fatigue; myalgia; *rarely* arthralgia, hypersensitivity reactions (including rash, angioedema, and anaphylaxis), hepatitis; *very rarely* pancreatitis, cholelithiasis, cholecystitis, thrombocytopenia, raised creatine kinase, myopathy, and rhabdomyolysis

Indication and dose

Adjunct to dietary measures and statin treatment in primary hypercholesterolaemia and homozygous familial hypercholesterolaemia (ezetimibe alone in primary hypercholesterolaemia if statin inappropriate or not tolerated) adjunct to dietary measures in homozygous sitosterolaemia

Child 10–18 years 10 mg once daily

Ezetrol® (MSD, Schering-Plough) ▼ (POM)

Tablets, ezetimibe 10 mg, net price 28-tab pack = £26.31

Fibrates

Bezafibrate and **fenofibrate** act mainly by decreasing serum triglycerides; they have variable effects on LDL-cholesterol. Fibrates may reduce the risk of coronary heart disease in those with low HDL-cholesterol or with raised triglycerides.

Fibrates can cause a myositis-like syndrome, especially in children with impaired renal function. Also, combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution (see CSM advice, p. 159).

There is limited evidence to support their use in children and they should only be considered if treatment with a statin and a bile acid sequestrant is unsuccessful or contra-indicated.

BEZAFIBRATE

Cautions correct hypothyroidism before initiating treatment (see Lipid-regulating Drugs, p. 159); see under Myotoxicity below; **interactions:** Appendix 1 (fibrates)

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly

Hepatic impairment avoid in severe impairment

Renal impairment reduce dose if estimated glomerular filtration rate 15–60 mL/minute/1.73 m²; avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m²; see also Myotoxicity above

Contra-indications hypoalbuminaemia, primary biliary cirrhosis, gall bladder disease, nephrotic syndrome

Pregnancy embryotoxicity in *animal* studies—manufacturers advise avoid

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disturbances, anorexia; *less commonly* cholestasis, weight gain, dizziness, headache, fatigue, drowsiness, renal impairment, raised serum creatinine (unrelated to renal impairment), erectile dysfunction, myotoxicity (with myasthenia or myalgia)—particular risk in renal impairment (see Cautions), urticaria, pruritus, photosensitivity reactions; *very rarely* gallstones, hypoglycaemia, anaemia, leucopenia,

□ BEZAFIBRATE (continued)

thrombocytopenia, increased platelet count, alopecia, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Licensed use not licensed for use in children

Indication and dose

Hyperlipidaemia including familial hypercholesterolaemia (on specialist advice only)

- By mouth

Child 10–18 years 200 mg once daily adjusted according to response to max. 200 mg 3 times daily

Bezafibrate (Non-proprietary) (POM)

Tablets, bezafibrate 200 mg, net price 100-tab pack = £11.23. Label: 21

Bezalip[®] (Roche) (POM)

Tablets, f/c, bezafibrate 200 mg, net price 100-tab pack = £9.15. Label: 21

FENOFIBRATE

Cautions see under Bezafibrate; liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised)

Hepatic impairment avoid in severe impairment

Renal impairment reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m²; avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m²

Contra-indications gall bladder disease; photosensitivity to ketoprofen

Pregnancy embryotoxicity in animal studies—manufacturer advises avoid

Breast-feeding manufacturer advises avoid—no information available

Side-effects see under Bezafibrate; also *very rarely* hepatitis, pancreatitis, and interstitial pneumopathies

Licensed use *Lipantil*[®] *Micro 67* is licensed for use in children with hypercholesterolaemia

Indication and dose

Hyperlipidaemias including familial hypercholesterolaemia (on specialist advice only)

- By mouth

Child 4–15 years 1 capsule/20 kg body-weight daily

Child 15–18 years initially 3 capsules daily in divided doses; usual range 2–4 capsules daily

Lipantil[®] (Solvay) (POM)

Lipantil[®] *Micro 67 capsules*, yellow, fenofibrate (micronised) 67 mg, net price 90-cap pack = £23.30. Label: 21

2.13 Local sclerosants

Classification not used in *BNF for Children*.

2.14 Drugs affecting the ductus arteriosus

Closure of the ductus arteriosus

Patent ductus arteriosus is a frequent problem in premature neonates with respiratory distress syndrome. Substantial left-to-right shunting through the ductus arteriosus may increase the risk of intraventricular haemorrhage, necrotising enterocolitis, bronchopulmonary dysplasia, and possibly death.

Indometacin or ibuprofen can be used to close the ductus arteriosus. **Indometacin** has been used for many years and is effective but it reduces cerebral blood flow, and causes a transient fall in renal and gastro-intestinal blood flow. **Ibuprofen** may also be used; it has little effect on renal function (there may be a small reduction in sodium excretion) when used in doses for closure of the ductus arteriosus; gastro-intestinal problems are uncommon.

If drug treatment fails to close the ductus arteriosus, surgery may be indicated.

IBUPROFEN

Cautions may mask symptoms of infection; monitor for bleeding; monitor gastro-intestinal function; allergic disorders; **interactions:** Appendix 1 (NSAIDs)

Hepatic impairment avoid in severe liver disease

Renal impairment use lowest effective dose and monitor renal function; sodium and water retention; deterioration in renal function possibly lead-

▮ IBUPROFEN (continued)

ing to renal failure; avoid if possible in severe impairment

Contra-indications life-threatening infection; active bleeding especially intracranial or gastro-intestinal; thrombocytopenia or coagulation defects; marked unconjugated hyperbilirubinaemia; known or suspected necrotising enterocolitis; pulmonary hypertension

Side-effects intestinal perforation; intraventricular haemorrhage; ischaemic brain injury; bronchopulmonary dysplasia, pulmonary haemorrhage; thrombocytopenia, neutropenia, oliguria, haematuria, fluid retention, hyponatraemia; *less commonly* gastro-intestinal haemorrhage; hypoxaemia

Licensed use Orphan licence for the injection for closure of ductus arteriosus in premature neonates less than 34 weeks gestational age

Indication and dose

Closure of ductus arteriosus

- By slow intravenous injection

Neonate initially 10 mg/kg as a single dose followed at 24-hour intervals by 2 doses of 5 mg/kg; course may be repeated after 48 hours if necessary

Mild to moderate pain, pain and inflammation of soft tissue injuries and rheumatic disease, pyrexia section 10.1.1

Administration By slow intravenous injection over 15 minutes, preferably undiluted. May be diluted, with Glucose 5% or Sodium Chloride 0.9%

Pedea® (Orphan Europe) (PvM)

Intravenous solution, ibuprofen 5 mg/mL, net price 4 × 2-mL vials = £263.00

INDOMETACIN

Cautions see notes above; also may mask symptoms of infection; may reduce urine output by 50% or more (monitor carefully—see also under Anuria or Oliguria, below) and precipitate renal impairment especially if extracellular volume depleted, heart failure, sepsis, or concomitant use of nephrotoxic drugs; may induce hyponatraemia; inhibition of platelet aggregation (monitor for bleeding); **interactions:** Appendix 1 (NSAIDs) **Anuria or oliguria** If anuria or marked oliguria (urinary output less than 0.6 mL/kg/hour), delay further doses until renal function returns to normal

Hepatic impairment can cause fluid retention; avoid in severe hepatic impairment

Renal impairment use lowest effective dose and monitor renal function; sodium and water retention; deterioration in renal function possibly leading to renal failure; avoid if possible in severe impairment

Contra-indications untreated infection, bleeding (especially with active intracranial haemorrhage or gastro-intestinal bleeding); thrombocytopenia, coagulation defects, necrotising enterocolitis

Side-effects haemorrhagic, renal, gastro-intestinal, metabolic, and coagulation disorders; pulmonary hypertension, intracranial bleeding, fluid retention, and exacerbation of infection

Indication and dose

Closure of ductus arteriosus

- By intravenous infusion over 20–30 minutes

Neonate under 48 hours initially 200 micrograms/kg as a single dose followed by (if urine

output adequate) 2 doses of 100 micrograms/kg at intervals of 12–24 hours; course may be repeated after 48 hours if necessary

Neonate 2–7 days initially 200 micrograms/kg as a single dose followed by (if urine output adequate) 2 doses of 200 micrograms/kg at intervals of 12–24 hours; course may be repeated after 48 hours if necessary

Neonate over 7 days initially 200 micrograms/kg as a single dose followed by (if urine output adequate) 2 doses of 250 micrograms/kg at intervals of 12–24 hours; course may be repeated after 48 hours if necessary

Note In some units by *intravenous infusion* initially 100 micrograms/kg (200 micrograms/kg if symptomatic) then 100 micrograms/kg every 24 hours for 5 further doses

Pain and inflammation in rheumatic disease section 10.1.1

Administration For *intravenous infusion* dilute each vial with 1–2 mL Sodium Chloride 0.9% or Water for Injections

Indocid PDA® (IDIS) (PvM)

Injection, powder for reconstitution, indometacin (as sodium trihydrate), net price 3 × 1-mg vials = £43.50 (hosp. only)

Maintenance of patency

In the newborn with duct-dependent congenital heart disease it is often necessary to maintain the patency of the ductus arteriosus whilst awaiting surgery.

Alprostadil (prostaglandin E1) and **dinoprostone** (prostaglandin E2) are potent vasodilators that are effective for maintaining the patency of the ductus arteriosus. They are usually given by continuous intravenous infusion, but oral dosing of dinoprostone is still used in some centres.

During the infusion of a prostaglandin, the newborn requires careful monitoring of heart rate, blood pressure, respiratory rate, and core body temperature. In the event of complications such as apnoea, profound bradycardia, or severe hypotension, the infusion should be temporarily stopped and the complication dealt with; the infusion should be restarted at a lower dose. Recurrent or prolonged apnoea may require ventilatory support in order for the prostaglandin infusion to continue.

ALPROSTADIL

Cautions see notes above; also history of haemorrhage; avoid in hyaline membrane disease; monitor arterial pressure, respiratory rate, heart rate, temperature, and venous blood pressure in arm and leg; facilities for intubation and ventilation must be immediately available; **interactions:** Appendix 1 (alprostadil)

Side-effects apnoea (particularly in neonates under 2 kg), flushing, bradycardia, hypotension, tachycardia, cardiac arrest, oedema, diarrhoea, fever, convulsions, disseminated intravascular coagulation, hypokalaemia; cortical proliferation of long bones; weakening of the wall of the ductus arteriosus and pulmonary artery may follow prolonged use; gastric-outlet obstruction reported

Indication and dose

Maintaining patency of the ductus arteriosus

- By continuous intravenous infusion

Neonate initially 5–10 nanograms/kg/minute, adjusted according to response in steps of 5–

10 nanograms/kg/minute; max. 100 nanograms/kg/minute (but associated with increased side-effects)

Note Alprostadil doses in BNFC may differ from those in product literature

Administration dilute 150 micrograms/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 nanograms/kg/minute. Undiluted solution must not come into contact with the barrel of the plastic syringe; add the required volume of alprostadil to a volume of infusion fluid in the syringe and then make up to final volume

Prostin VR[®] (Pharmacia) (P_m)

Intravenous solution, alprostadil 500 micrograms/mL in alcohol. For dilution and use as an infusion. Net price 1-mL amp = £75.19 (hosp.only)

DINOPROSTONE

Cautions see notes above; also history of haemorrhage; avoid in hyaline membrane disease; monitor arterial oxygenation, heart rate, temperature, and blood pressure in arm and leg; facilities for intubation and ventilation must be immediately available; **interactions:** Appendix 1 (prostaglandins)

Contra-indications

Hepatic impairment manufacturer advises avoid in hepatic impairment

Renal impairment manufacturer advises avoid in renal impairment

Side-effects nausea, vomiting, diarrhoea; flushing, bradycardia, hypotension, cardiac arrest; respiratory depression and apnoea, particularly with high doses and in low birth-weight neonates, bronchospasm; pyrexia and raised white blood cell count, shivering; local reactions, erythema; if used for longer than 5 days, gastric outlet obstruction; cortical hyperostosis (prolonged use)

Licensed use not licensed for use in children

Indication and dose

Maintaining patency of the ductus arteriosus

- By continuous intravenous infusion

Neonate initially 5–10 nanograms/kg/minute, increased as necessary in 5 nanogram/kg/minute increments to 20 nanograms/kg/minute

Note Doses up to 100 nanograms/kg/minute have been used but are associated with increased side-effects

- By mouth

Neonate 20–25 micrograms/kg every 1–2 hours doubled if necessary; if treatment continues for more than 1 week gradually reduce the dose

Administration for *continuous intravenous infusion*, dilute to a concentration of 1 microgram/mL with Glucose 5% or Sodium Chloride 0.9%.

For administration *by mouth*, injection solution can be given orally; dilute with water

Prostin[®] E2 (Pharmacia) (P_m)

Intravenous solution, for dilution and use as an infusion, dinoprostone 1 mg/mL, net price 0.75-mL amp = £8.52; 10 mg/mL, 0.5-mL amp = £18.40 (both hosp. only)

This chapter includes advice on the drug management of the following:

- acute asthma, p. 168
- anaphylaxis, p. 198
- angioedema, p. 201
- chronic asthma, p. 170
- croup, p. 169

3.1 Bronchodilators

- 3.1.1 Adrenoceptor agonists
- 3.1.2 Antimuscarinic bronchodilators
- 3.1.3 Theophylline
- 3.1.4 Compound bronchodilator preparations
- 3.1.5 Peak flow meters, inhaler devices, and nebulisers

Asthma

Drugs used in the management of asthma include beta₂ agonists (section 3.1.1), antimuscarinic bronchodilators (section 3.1.2), theophylline (section 3.1.3), corticosteroids (section 3.2), cromoglicic acid and nedocromil (section 3.3.1), and leukotriene receptor antagonists (section 3.3.2).

For tables outlining the management of chronic asthma and management of acute asthma, see p. 170 and p. 171.

Administration of drugs for asthma

Inhalation This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced. See Inhaler devices, section 3.1.5.

Solutions for nebulisation for use in acute severe asthma are administered over 5–10 minutes from a nebuliser, usually driven by oxygen in hospital. See Nebulisers, section 3.1.5.

Oral Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Oral corticosteroids, theophylline, and leukotriene receptor antagonists are sometimes required for the management of asthma. Oral administration of a beta₂ agonist is generally not recommended for children, but may be necessary in infants and young children unable to use an inhaler device.

Parenteral Drugs such as beta₂ agonists, corticosteroids, and aminophylline can be given by injection in acute severe asthma when drug administration by nebulisation is inadequate or inappropriate; in these circumstances the child should generally be treated in a high-dependency or intensive care unit.

Pregnancy and breast-feeding

Women with asthma should be closely monitored during pregnancy. Well-controlled asthma has no important effects on pregnancy, labour, or the fetus. Drugs for asthma should preferably be administered by inhalation to minimise fetal drug exposure. Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.

Severe exacerbations of asthma can have an adverse effect on pregnancy and should be treated promptly with conventional therapy, including oral or parenteral administration of a corticosteroid and nebulisation of a beta₂ agonist; prednisolone is the preferred corticosteroid for oral administration since very little of the drug reaches the fetus. Oxygen should be given immediately to maintain an arterial oxygen saturation of 94–98% and prevent maternal and fetal hypoxia.

Inhaled drugs, theophylline, and prednisolone can be taken as normal during pregnancy and breast-feeding.

Management of acute asthma¹

Important

Regard each emergency consultation as being for **severe acute asthma** until shown otherwise.

Failure to respond adequately **at any time** requires immediate transfer to hospital.

1. Advice on the management of acute asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated May 2008); updates available at www.brit-thoracic.org.uk

Severe acute asthma can be fatal and must be treated promptly and energetically. Treatment of severe acute asthma is safer in hospital where resuscitation facilities are immediately available. Treatment should **never** be delayed for investigations, children should **never** be sedated, and the possibility of a pneumothorax should be considered. If the child's condition deteriorates despite pharmacological treatment, urgent transfer to a paediatric intensive care unit should be arranged. For a table outlining the management of severe acute asthma, see Management of acute asthma p. 171.

Mild to moderate acute asthma Administer a **short-acting beta₂ agonist** using a pressurised metered-dose inhaler with a spacer device; for a child under 3 years use a close-fitting facemask. Give 1 puff every 15–30 seconds up to a maximum of 10 puffs; repeat dose after 10–20 minutes if necessary.

Give **prednisolone** by mouth, child under 12 years 1–2 mg/kg (max. 40 mg) once daily for 3–5 days; if the child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily. For children 12–18 years, give prednisolone 40–50 mg daily for at least 5 days.

If response is poor or if a relapse occurs within 3–4 hours, transfer child **immediately** to hospital for assessment and further treatment.

Children under 18 months often respond poorly to bronchodilators; nebulised beta₂ agonists have been associated with mild (but occasionally severe) paradoxical bronchospasm and transient worsening of oxygen saturation; response to prednisolone may also be poor in this age group.

Severe or life-threatening acute asthma Transfer **immediately** to hospital. Administer high-flow **oxygen** (section 3.6) using a close-fitting face mask or nasal prongs.

Treat severe or life-threatening acute exacerbations of asthma with an inhaled **short-acting beta₂ agonist** (as above). Treatment of life-threatening asthma should be initiated with nebulised salbutamol 2.5 mg or terbutaline 5 mg (via an oxygen-driven nebuliser if available); nebulised doses may be doubled for children over 5 years. Repeat the dose every 10–20 minutes or as necessary, then reduce the frequency on improvement.

If response is poor, add nebulised **ipratropium bromide** 250 micrograms every 20–30 minutes over the first 2 hours, then reduce the frequency on improvement.

Give **prednisolone** by mouth, child under 12 years 1–2 mg/kg (max. 40 mg) once daily for 3–5 days; if the child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily. For children 12–18 years, give prednisolone 40–50 mg daily for at least 5 days. If oral administration is not possible, use intravenous **hydrocortisone** (preferably as sodium succinate) 4 mg/kg (child under 2 years max. 25 mg, 2–5 years 50 mg, 5–18 years 100 mg) 3–4 times daily.

If the condition does not respond or is life-threatening, transfer the child to an intensive care unit and treat with a parenteral **short-acting beta₂ agonist** (e.g. salbutamol) (section 3.1.1.1) or parenteral **aminophylline** (section 3.1.3). Children over 2 years with severe asthma may be helped by intravenous infusion of **magnesium sulphate** 40 mg/kg (max. 2 g) over 20 minutes (section 9.5.1.3), but evidence of benefit is limited.

Croup

Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. **dexamethasone** 150 micrograms/kg) by mouth is of benefit.

Severe croup (or mild croup that might cause complications) calls for hospital admission—a single dose of either dexamethasone 150 micrograms/kg or prednisolone 1–2 mg/kg, can be administered by mouth before transfer to hospital. In hospital, dexamethasone 150 micrograms/kg (by mouth or by injection) or budesonide 2 mg by nebulisation (section 3.2) will often reduce symptoms; the dose may be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised **adrenaline** (section 3.4.3) solution 1 in 1000 (1 mg/mL) can be given with close clinical monitoring in a dose of 400 micrograms/kg (max. 5 mg) repeated after 30 minutes if necessary (the dose may be diluted with sterile sodium chloride 0.9% solution). The effects of nebulised adrenaline last 2–3 hours; the child needs to be carefully monitored for recurrence of the obstruction.

Management of chronic asthma

Start at **step most appropriate** to initial severity; before initiating a new drug consider whether diagnosis is correct, check compliance and inhaler technique, and eliminate trigger factors for acute exacerbations

Child 5–18 years

Step 1: occasional relief bronchodilator

Inhaled short-acting beta₂ agonist as required (up to once daily)

Note Move to step 2 if needed more than twice a week, or if night-time symptoms more than once a week, or if exacerbation in the last 2 years

Step 2: regular inhaled preventer therapy

Inhaled short-acting beta₂ agonist as required

plus

Regular standard-dose¹ inhaled corticosteroid (alternatives² are considerably less effective)

Step 3: inhaled corticosteroid + inhaled long-acting beta₂ agonist

Inhaled short-acting beta₂ agonist as required

plus

Regular standard-dose¹ inhaled corticosteroid

plus

Regular inhaled long-acting beta₂ agonist (salmeterol or formoterol)

If asthma not controlled

Increase dose of inhaled corticosteroid to upper end of standard dose range¹

and

Either stop long-acting beta₂ agonist if of no benefit
Or continue long-acting beta₂ agonist if of some benefit
If asthma still not controlled and long-acting beta₂ agonist stopped, add one of

- Leukotriene receptor antagonist
- Modified-release oral theophylline
- Modified-release oral beta₂ agonist

Step 4: high-dose inhaled corticosteroid + regular bronchodilators

Inhaled short-acting beta₂ agonist as required

with

Regular high-dose³ inhaled corticosteroid

plus

Inhaled long-acting beta₂ agonist (if of benefit)

plus

A 6-week sequential therapeutic trial of one or more of

- Leukotriene receptor antagonist
- Modified-release oral theophylline
- Modified-release oral beta₂ agonist

Step 5: regular corticosteroid tablets

Refer to respiratory paediatrician

Inhaled short-acting beta₂ agonist as required

with

Regular high-dose³ inhaled corticosteroid

and

One or more long-acting bronchodilators (see step 4)

plus

Regular prednisolone tablets (as single daily dose)

Note In addition to regular prednisolone, continue high-dose inhaled corticosteroid (in exceptional cases may exceed licensed doses)

Stepping down

Review treatment every 3 months; if control achieved stepwise reduction may be possible; reduce dose of *inhaled* corticosteroid slowly (consider reduction every 3 months, decreasing dose by up to 50% each time) to the lowest dose which controls asthma

Child under 5 years⁴

Step 1: occasional relief bronchodilator

Short-acting beta₂ agonist as required (not more than once daily)

Note Preferably by inhalation (less effective and more side-effects when given as tablets or syrup)

Move to step 2 if needed more than twice a week, or if night-time symptoms more than once a week, or if exacerbation in last 2 years

Step 2: regular preventer therapy

Inhaled short-acting beta₂ agonist as required

plus

Regular standard-dose¹ inhaled corticosteroid
Or leukotriene receptor antagonist if inhaled corticosteroid cannot be used

Step 3: add-on therapy

Child under 2 years:

Refer to respiratory paediatrician

Child 2–5 years:

Inhaled short-acting beta₂ agonist as required

plus

Regular standard-dose¹ inhaled corticosteroid

plus

Leukotriene receptor antagonist

Step 4: persistent poor control

Refer to respiratory paediatrician

Stepping down

Regularly review need for treatment

1. **Standard doses** of inhaled corticosteroids (metered-dose inhaler used with large-volume spacer)
Beclometasone dipropionate or **budesonide**:
Child under 12 years 100–200 micrograms twice daily;
Child 12–18 years 100–400 micrograms twice daily.
Fluticasone propionate:
Child 4–12 years 50–100 micrograms twice daily;
Child 12–18 years 50–200 micrograms twice daily.
Mometasone furoate (given through dry powder inhaler):
Child 12–18 years 200 micrograms twice daily
2. Alternatives to inhaled corticosteroid are leukotriene receptor antagonists, theophylline, inhaled nedocromil, or inhaled cromoglicic acid
3. **High doses** of inhaled corticosteroids (metered-dose inhaler used with large-volume spacer)
Beclometasone dipropionate or **budesonide**:
Child 5–12 years 200–400 micrograms twice daily;
Child 12–18 years 0.4–1 mg twice daily.
Fluticasone propionate:
Child 5–12 years 100–200 micrograms twice daily;
Child 12–18 years 200–500 micrograms twice daily.
Mometasone furoate (given through dry powder inhaler):
Child 12–18 years up to 400 micrograms twice daily.
Note. Failure to achieve control with these doses is unusual, see also Side-effects of Inhaled Corticosteroids, section 3.2
4. Lung-function measurements cannot be used to guide management in those under 5 years

Management of acute asthma

Important The assessment of acute asthma in early childhood can be difficult. Children with severe or life-threatening acute asthma may not be distressed and may not have all of these abnormalities; the presence of any should alert the doctor. Regard each emergency consultation as being for **severe acute asthma** until shown otherwise

Moderate acute asthma

- **Respiration**
Child 2–5 years ≤ 50 breaths/minute, 5–12 years ≤ 30 breaths/minute, 12–18 years < 25 breaths/minute
- **Pulse** **Child** 2–5 years ≤ 130 beats/minute, 5–12 years ≤ 120 beats/minute, 12–18 years < 110 beats/minute
- **Arterial oxygen saturation** $\geq 92\%$
- **Peak flow** **Child** 5–12 years $\geq 50\%$ of predicted or best, 12–18 years $> 50\%$ of predicted or best

Treat at home or in surgery and assess response to treatment

Treatment

- **Inhaled short-acting beta₂ agonist** via a large-volume spacer (and a close-fitting face mask if child under 3 years) or oxygen-driven nebuliser (if available); give 4–10 puffs of **salbutamol** 100 micrograms/metered inhalation each inhaled separately, and repeat at 10–20 minute intervals if necessary or give nebulised **salbutamol**, **Child** under 5 years 2.5 mg, 5–12 years 2.5–5 mg, 12–18 years 5 mg or **terbutaline** **Child** under 5 years 5 mg, 5–12 years 5–10 mg, 12–18 years 10 mg, and repeat at 10–20 minute intervals if necessary
- **Prednisolone** by mouth **Child** under 12 years 1–2 mg/kg (max. 40 mg) daily for 3–5 days; if the child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg); **Child** 12–18 years 40–50 mg daily for at least 5 days

Monitor response for 15–30 minutes. If response is poor or a relapse occurs in 3–4 hours, send immediately to hospital for assessment and further treatment

Follow up in all cases

Monitor symptoms and peak flow
Set up asthma action plan and check inhaler technique with child and carer
Review by general practitioner within 48 hours; modify treatment according to the Management of Chronic Asthma table, p. 170

Severe acute asthma

- **Child** under 12 years too breathless to talk or feed, 12–18 years cannot complete sentences in one breath
- Use of accessory breathing muscles
- **Respiration** **Child** 2–5 years > 50 breaths/minute, 5–12 years > 30 breaths/minute, 12–18 years ≥ 25 breaths/minute
- **Pulse** **Child** 2–5 years > 130 beats/minute, 5–12 years > 120 beats/minute, 12–18 years ≥ 110 beats/minute
- **Arterial oxygen saturation** $< 92\%$
- **Peak flow** **Child** 5–12 years $< 50\%$ of predicted or best, 12–18 years 33–50% of predicted or best

Send immediately to hospital

Treatment

- **High-flow oxygen** (if available)
- **Inhaled short-acting beta₂ agonist** via a large-volume spacer (and a close-fitting face mask if child under 3 years) or oxygen-driven nebuliser (if available); give 4–10 puffs of **salbutamol** 100 micrograms/metered inhalation each inhaled separately, and repeat at 10–20 minute intervals or as necessary or give nebulised **salbutamol**, **Child** under 5 years 2.5 mg, 5–12 years 2.5–5 mg, 12–18 years 5 mg or **terbutaline** **Child** under 5 years 5 mg, 5–12 years 5–10 mg, 12–18 years 10 mg, and repeat at 10–20 minute intervals or as necessary
- **Prednisolone** by mouth as for moderate acute asthma or intravenous **hydrocortisone** (preferably as sodium succinate) 4 mg/kg (**Child** under 2 years max. 25 mg, 2–5 years 50 mg, 5–18 years 100 mg) 3–4 times daily until conversion to oral prednisolone is possible

Monitor response for 15–30 minutes. If response is poor:

- **Inhaled ipratropium bromide** via oxygen-driven nebuliser (if available), **Child** under 12 years, 250 micrograms, 12–18 years, 500 micrograms and repeat at 20–30 minute intervals if necessary
- Refer those who fail to respond and require ventilatory support to a paediatric intensive care or high-dependency unit*

- Consider intravenous **beta₂ agonists**, **aminophylline**, or **magnesium sulphate** [unlicensed indication] only after consultation with senior medical staff

If symptoms improve, follow up as for moderate acute asthma

Life-threatening acute asthma

Arterial oxygen saturation $< 92\%$ plus any of the following:

- Silent chest
- Poor respiratory effort
- Cyanosis
- Reduced level of consciousness
- Peak flow $< 33\%$ of predicted or best

Send immediately to hospital; consult with senior medical staff and refer to paediatric intensive care

Treatment

- **High-flow oxygen** (if available)
- **Inhaled short-acting beta₂ agonist** via oxygen-driven nebuliser (if available); give **salbutamol**, **Child** under 5 years 2.5 mg, 5–12 years 2.5–5 mg, 12–18 years 5 mg, or **terbutaline**, **Child** under 5 years 5 mg, 5–12 years 5–10 mg, 12–18 years 10 mg, and repeat as necessary; reserve intravenous **beta₂ agonists** for those in whom inhaled therapy cannot be used reliably or there is no current effect
- **Prednisolone** by mouth as for moderate acute asthma or intravenous **hydrocortisone** (preferably as sodium succinate) 4 mg/kg (**Child** under 2 years, max. 25 mg, 2–5 years 50 mg, 5–18 years 100 mg) 3–4 times daily until conversion to oral prednisolone is possible
- **Inhaled ipratropium bromide** via oxygen-driven nebuliser (if available), **Child** under 12 years 250 micrograms, 12–18 years 500 micrograms and repeat at 20–30 minute intervals if necessary

Monitor response for 15–30 minutes

- Consider intravenous **beta₂ agonists**, **aminophylline**, or **magnesium sulphate** [unlicensed indication] only after consultation with senior medical staff

If symptoms improve, follow up as for moderate acute asthma

3.1.1 Adrenoceptor agonists

(Sympathomimetics)

3.1.1.1 Selective beta₂ agonists

3.1.1.2 Other adrenoceptor agonists

The selective beta₂ agonists (selective beta₂-adrenoceptor agonists, selective beta₂ stimulants) such as salbutamol or terbutaline are the safest and most effective short-acting beta₂ agonists for the treatment of asthma. Less selective beta₂ agonists, such as orciprenaline, are no longer recommended for the treatment of asthma.

Adrenaline (epinephrine), which has both alpha- and beta-adrenoceptor agonist properties, is used in the emergency management of allergic and anaphylactic reactions (section 3.4.3); it is also used as a nebuliser solution to treat severe croup.

3.1.1.1 Selective beta₂ agonists

Selective beta₂ agonists produce bronchodilation. A short-acting beta₂ agonist is used for immediate relief of asthma symptoms while a long-acting beta₂ agonist is used in addition to an inhaled corticosteroid in children requiring prophylactic treatment.

Short-acting beta₂ agonists Mild to moderate symptoms of asthma respond rapidly to the inhalation of a selective short-acting beta₂ agonist such as **salbutamol** or **terbutaline**. If beta₂ agonist inhalation is needed more often than once daily, prophylactic treatment should be considered, using a stepped approach as outlined in the Management of Chronic Asthma, p. 170. Regular treatment with an inhaled short-acting beta₂ agonist is less effective than 'as required' inhalation and is not appropriate prophylactic treatment.

A short-acting beta₂ agonist inhaled immediately before exertion reduces *exercise-induced asthma*; however, frequent exercise-induced asthma probably reflects poor overall control and calls for reassessment of asthma treatment.

Long-acting beta₂ agonists **Formoterol** (eformoterol) and **salmeterol** are longer-acting beta₂ agonists which are administered by inhalation. Added to regular inhaled corticosteroid treatment, they have a role in the long-term control of chronic asthma (see Management of Chronic Asthma, p. 170) and they can be useful in nocturnal asthma. Salmeterol should not be used for the relief of an asthma attack; it has a slower onset of action than salbutamol or terbutaline. Formoterol is licensed for short-term symptom relief and for the prevention of exercise-induced bronchospasm; its speed of onset of action is similar to that of salbutamol.

CHM advice

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonists (formoterol and salmeterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect monitored before considering dose increase;
- be discontinued in the absence of benefit;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

Children and their carers should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta₂ agonist, see Management of Chronic Asthma, p. 170.

Management of Chronic Asthma, see p. 170

Management of Acute Asthma, see p. 168

For guidance on the use of inhalers and spacer devices, see section 3.1.5

Inhalation A *pressurised metered-dose inhaler* is an effective method of drug administration in mild to moderate chronic asthma; to deliver the drug effectively particularly in children under 12 years, a spacer device should be used (see also NICE guidance, section 3.1.5). When a pressurised metered-dose inhaler with a spacer is unsuitable or inconvenient, a *dry-powder inhaler* or *breath-actuated inhaler* may be used instead if the child is able to use the device effectively. At recommended inhaled doses the duration of action of salbutamol and terbutaline is about 3 to 5 hours and for salmeterol and formoterol is about 12 hours. The **dose**, the frequency, and the maximum number of inhalations in 24 hours of the beta₂ agonist should be **stated explicitly** to the child and the child's carer. High doses of beta₂ agonists can be dangerous in some children (see Cautions, below). Excessive use is usually an indication of **inadequately controlled** asthma and should be managed with a prophylactic drug such as an inhaled corticosteroid. The child and the child's carer should be advised to seek medical advice when the prescribed dose of beta₂ agonist fails to provide the usual degree of symptomatic relief because this usually indicates a worsening of the asthma and the child may require alternative medication (see Management of Chronic Asthma, p. 170).

Children and their carers should be advised to follow manufacturers' instructions on the care and cleansing of inhaler devices.

CFC-free inhalers Chlorofluorocarbon (CFC) propellants in pressurised metered-dose inhalers are being replaced by hydrofluoroalkane (HFA) propellants. Children receiving CFC-free inhalers and their carers should be reassured about the efficacy of the new inhalers and counselled that the aerosol may feel and taste different to their previous CFC-based inhaler; any difficulty with the new inhaler should be discussed with the doctor or pharmacist.

Nebuliser (or respirator) solutions of salbutamol and terbutaline are used for the treatment of severe acute asthma both in hospital and in general practice. Children with a severe attack of asthma should have oxygen if possible during nebulisation since beta₂ agonists can increase arterial hypoxaemia, see also section 3.1.5.

Oral Oral preparations of beta₂ agonists may be used for children if an inhaler device cannot be used but inhaled beta₂ agonists are more effective and have fewer side-effects. A modified-release formulation of salbutamol may be of value in nocturnal asthma as an alternative to modified-release theophylline preparations (section 3.1.3), but an inhaled long-acting beta₂ agonist is preferable.

Parenteral Beta₂ agonists can be given intravenously in children with severe or life-threatening acute asthma. Chronic asthma unresponsive to stepwise treatment (see Management of Chronic Asthma, p. 170) may benefit from continuous subcutaneous infusion of a beta₂ agonist but this should be used only under the supervision of a respiratory specialist; the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started.

Cautions Beta₂ agonists should be used with caution in diabetes—monitor blood glucose (risk of ketoacidosis, especially when a beta₂ agonist is given intravenously). Beta₂ agonists should also be used with caution in hyperthyroidism, cardiovascular disease, arrhythmias, susceptibility to QT-interval prolongation, and hypertension. If high doses of beta₂ agonists are needed during pregnancy they should be given by inhalation because a parenteral beta₂ agonist can affect the myometrium and possibly cause cardiac problems; see also Pregnancy and Breast-feeding, section 3.1. **Interactions:** Appendix 1 (sympathomimetics, beta₂).

Hypokalaemia The CSM has advised that potentially serious hypokalaemia may result from beta₂ agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Side-effects Side-effects of the beta₂ agonists include fine tremor (particularly in the hands), nervous tension, headache, peripheral dilatation and palpitation. Other side-effects include tachycardia, arrhythmias, peripheral vasodilation, myocardial ischaemia, and disturbances of sleep and behaviour. Muscle cramps and

hypersensitivity reactions including paradoxical bronchospasm (occasionally severe), urticaria, angioedema, hypotension, and collapse have also been reported. High doses of beta₂ agonists are associated with hypokalaemia (for CSM advice, see Hypokalaemia, p. 173).

FORMOTEROL FUMARATE

(Eformoterol fumarate)

Cautions see notes above

Hepatic impairment metabolism possibly reduced in severe cirrhosis

Pregnancy see section 3.1 (manufacturers advise use only if potential benefit outweighs risk)

Breast-feeding amount in milk probably too small to be harmful but manufacturers advise avoid

Side-effects see notes above; nausea, dizziness, rash, taste disturbances, and pruritus also reported

Indication and dose

Reversible airways obstruction (including nocturnal asthma and prevention of exercise-induced bronchospasm) in patients requiring long-term regular bronchodilator therapy see also Management of Chronic Asthma, p. 170; for dose see preparations below

Counselling Advise children and carers not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled formoterol fails to provide adequate relief, a doctor's advice should be obtained as soon as possible

Formoterol (Non-proprietary) (P_{oM})

Dry powder for inhalation, formoterol fumarate 12 micrograms/metered inhalation, net price 120-dose unit = £24.80. Counselling, dose
Brands include *Easylhaler® Formoterol*

Dose

Chronic asthma

• By inhalation of powder

Child 6–18 years 12 micrograms twice daily, increased to 24 micrograms twice daily in more severe airways obstruction

Atimos Modulite® (Chiesi) ▼ (P_{oM})

Aerosol inhalation, formoterol fumarate 12 micrograms/metered inhalation, net price 100-dose unit = £31.28. Counselling, dose

Dose

Chronic Asthma

• By aerosol inhalation

Child 12–18 years 12 micrograms twice daily, increased to max. 24 micrograms twice daily in more severe airways obstruction

Foradil® (Novartis) (P_{oM})

Dry powder for inhalation, formoterol fumarate 12 micrograms/capsule, net price 60-cap pack (with inhaler device) = £29.23. Counselling, dose

Dose

Chronic asthma

• By inhalation of powder

Child 5–18 years 12 micrograms twice daily, increased to 24 micrograms twice daily in more severe airways obstruction

Oxis® (AstraZeneca) (P_{oM})

Turbohaler® (= dry powder inhaler), formoterol fumarate 6 micrograms/inhalation, net price 60-dose unit = £24.80; 12 micrograms/inhalation, 60-dose unit = £24.80. Counselling, dose

Dose

Chronic asthma

• By inhalation of powder

Child 6–18 years 6–12 micrograms 1–2 times daily; occasionally up to 48 micrograms daily may be needed (max. single dose 12 micrograms); reassess treatment if additional doses required on more than 2 days a week

Relief of bronchospasm

• By inhalation of powder

Child 6–18 years 6–12 micrograms

Prevention of exercise-induced bronchospasm

• By inhalation of powder

Child 6–18 years 6–12 micrograms before exercise

Compound preparations

For compound preparations containing formoterol, see section 3.2

SALBUTAMOL

(Albuterol)

Cautions see notes above

Side-effects see notes above

Licensed use not licensed for use in hyperkalaemia; syrup not licensed for use in children under 2 years; modified-release tablets not licensed for use in children under 3 years; injection not licensed for use in children; *Pulvinal® Salbutamol* not licensed for use in children under 6 years

Indication and dose

Acute asthma

• By aerosol or nebulised solution inhalation
See Management of Acute Asthma, p. 168

• By intravenous injection over 5 minutes (see also Management of Acute Asthma, p. 168)

Child 1 month–2 years 5 micrograms/kg as a single dose

Child 2–18 years 15 micrograms/kg (max. 250 micrograms) as a single dose

▢ SALBUTAMOL (continued)

• By continuous intravenous infusion

Child 1 month–18 years 1–2 micrograms/kg/minute, adjusted according to response and heart rate up to 5 micrograms/kg/minute; doses above 2 micrograms/kg/minute should be given in an intensive care setting

Exacerbations of reversible airways obstruction (including nocturnal asthma) and prevention of allergen- or exercise-induced bronchospasm, see also Management of Chronic Asthma, p. 170

• By aerosol inhalation

Child 1 month–18 years 100–200 micrograms (1–2 puffs); for persistent symptoms up to 4 times daily

• By inhalation of powder

(for *Asmasal Clickhaler*[®], *Salbulin Novolizer*[®], and *Ventolin Accuhaler*[®] doses, see under preparations)

Child 5–12 years 200 micrograms; for persistent symptoms up to 4 times daily

Child 12–18 years 200–400 micrograms; for persistent symptoms up to 4 times daily

• By mouth (but use by inhalation preferred)

Child 1 month–2 years 100 micrograms/kg (max. 2 mg) 3–4 times daily

Child 2–6 years 1–2 mg 3–4 times daily

Child 6–12 years 2 mg 3–4 times daily

Child 12–18 years 4 mg (sensitive patients initially 2 mg) 3–4 times daily; max. single dose 8 mg (but unlikely to provide extra benefit or to be tolerated)

Severe hyperkalaemia (section 9.2.1.1)

• By intravenous injection over 5 minutes

Neonate 4 micrograms/kg as a single dose; repeat if necessary

Child 1 month–18 years 4 micrograms/kg as a single dose; repeat if necessary

• By inhalation of nebulised solution (but intravenous injection preferred)

Neonate 2.5–5 mg as a single dose; repeat if necessary

Child 1 month–18 years 2.5–5 mg as a single dose; repeat if necessary

Administration for *continuous intravenous infusion*, dilute to a concentration of 200 micrograms/mL with Glucose 5%, Sodium Chloride 0.9%, or Water for injections; if fluid-restricted, can be given undiluted through central venous catheter. For *intravenous injection*, dilute to a concentration of 50 micrograms/mL with Glucose 5%, Sodium Chloride 0.9%, or Water for injections. For *nebulisation*, dilute nebuliser solution with a suitable volume of sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; salbutamol and ipratropium bromide solutions are compatible and can be mixed for nebulisation.

▀ Oral

Salbutamol (Non-proprietary) ^(PoM)

Tablets, salbutamol (as sulphate) 2 mg, net price 28-tab pack = £12.71; 4 mg, 28-tab pack = £12.20

Oral solution, salbutamol (as sulphate) 2 mg/5 mL, net price 150 mL = £1.27

Brands include *Salapin*[®] (sugar-free)

Ventmax[®] SR (Chiesi) ^(PoM)

Capsules, m/r, salbutamol (as sulphate) 4 mg (green/grey), net price 56-cap pack = £8.57; 8 mg (white), 56-cap pack = £10.28. Label: 25

Dose

Chronic asthma (but see notes above)

• By mouth

Child 3–12 years 4 mg twice daily

Child 12–18 years 8 mg twice daily

Ventolin[®] (A&H) ^(PoM)

Syrup, sugar-free, salbutamol (as sulphate) 2 mg/5 mL, net price 150 mL = 60p

▀ Parenteral

Ventolin[®] (A&H) ^(PoM)

Injection, salbutamol (as sulphate) 500 micrograms/mL, net price 1-mL amp = 40p

Solution for intravenous infusion, salbutamol (as sulphate) 1 mg/mL. Dilute before use. Net price 5-mL amp = £2.58

▀ Inhalation

Counselling Advise children and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible.

Patients receiving CFC-free inhalers should be reassured about their efficacy and counselled that aerosol may feel and taste different (see notes above)

Salbutamol (Non-proprietary) ^(PoM)

Aerosol inhalation, salbutamol 100 micrograms/metered inhalation, net price 200-dose unit = £2.88. Counselling, dose

Excipients include CFC propellants

Aerosol inhalation, salbutamol (as sulphate) 100 micrograms/metered inhalation, net price 200-dose unit = £2.99. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant). Brands include *Salamol*[®]

Note Can be supplied against a generic prescription but if CFC-free not specified will be reimbursed at price for CFC-containing inhaler

Dry powder for inhalation, salbutamol 100 micrograms/metered inhalation, net price 200-dose unit = £3.46; 200 micrograms/metered inhalation, 100-dose unit = £5.05, 200-dose unit = £6.92. Counselling, dose

Brands include *Easyhaler*[®] *Salbutamol*, *Pulvinal*[®] *Salbutamol*

Inhalation powder, hard capsule (for use with *Cyclohaler*[®] device), salbutamol 200 micrograms, net price 120-cap pack = £8.99; 400 micrograms, 120-cap pack = £12.99. Counselling, dose

Brands include *Salbutamol Cyclocaps*[®]

▮ SALBUTAMOL (continued)

Nebuliser solution, salbutamol (as sulphate) 1 mg/mL, net price 20 × 2.5 mL (2.5 mg) = £1.99; 2 mg/mL, 20 × 2.5 mL (5 mg) = £3.98. May be diluted with sterile sodium chloride 0.9%
Brands include *Salamol Steri-Neb*®

Airomir® (IVAX) (POM)

Aerosol inhalation, salbutamol (as sulphate) 100 micrograms/metered inhalation, net price 200-dose unit = £1.97. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant)

Note Can be supplied against a generic prescription but if 'CFC-free' not specified will be reimbursed at price for CFC-containing inhaler

Autohaler (breath-actuated aerosol inhalation), salbutamol (as sulphate) 100 micrograms/metered inhalation, net price 200-dose unit = £6.02. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant),

Asmasal Clickhaler® (UCB Pharma) (POM)

Dry powder for inhalation, salbutamol (as sulphate) 95 micrograms/metered inhalation, net price 200-dose unit = £5.88. Counselling, dose

Dose

Acute bronchospasm

- **By inhalation of powder**
Child 5–18 years 1–2 puffs; for persistent symptoms up to 4 times daily (but see also Management of Chronic Asthma, p. 170)

Prophylaxis of allergen- or exercise-induced bronchospasm

- **By inhalation of powder**
Child 5–18 years 1–2 puffs

Salamol Easi-Breathe® (IVAX) (POM)

Aerosol inhalation, salbutamol 100 micrograms/metered inhalation, net price 200-dose breath-actuated unit = £6.30. Counselling, dose
Excipients include HFA-134a (a non-CFC propellant)

Salbulin Novolizer® (Meda) (POM)

Dry powder for inhalation, salbutamol (as sulphate) 100 micrograms/metered inhalation, net price refillable 200-dose unit = £4.95; 200-dose refill = £2.75. Counselling, dose

Dose

Acute bronchospasm

- **By inhalation of powder**
Child 6–12 years 100–200 micrograms; for persistent symptoms up to 400 micrograms daily (but see also Management of Chronic Asthma, p. 170)
Child 12–18 years 100–200 micrograms; for persistent symptoms up to 800 micrograms daily (but see also Management of Chronic Asthma, p. 170)

Prophylaxis of allergen- or exercise-induced bronchospasm

- **By inhalation of powder**
Child 6–12 years 100–200 micrograms
Child 12–18 years 200 micrograms

Ventolin® (A&H) (POM)

Accuhaler® (dry powder for inhalation), disk containing 60 blisters of salbutamol (as sulphate) 200 micrograms/blister with *Accuhaler®* device, net price = £5.12. Counselling, dose

Dose

Acute bronchospasm

- **By inhalation of powder**
Child 5–18 years 200 micrograms; for persistent symptoms up to 4 times daily but see also Management of Chronic Asthma, p. 170

Prophylaxis of allergen- or exercise-induced bronchospasm

- **By inhalation of powder**
Child 5–18 years 200 micrograms

Evohaler® aerosol inhalation, salbutamol (as sulphate) 100 micrograms/metered inhalation, net price 200-dose unit = £1.50. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant)

Note Can be supplied against a generic prescription but if CFC-free not specified will be reimbursed at price for CFC-containing inhaler

Nebules® (for use with nebuliser), salbutamol (as sulphate) 1 mg/mL, net price 20 × 2.5 mL (2.5 mg) = £1.75; 2 mg/mL, 20 × 2.5 mL (5 mg) = £2.95. May be diluted with sterile sodium chloride 0.9%

Respirator solution (for use with a nebuliser or ventilator), salbutamol (as sulphate) 5 mg/mL. Net price 20 mL = £2.27 (hosp. only). May be diluted with sterile sodium chloride 0.9%

SALMETEROL

Note Not for immediate relief of acute attacks; existing corticosteroid therapy should not be reduced or withdrawn

Cautions see notes above

Side-effects see notes above; nausea, dizziness, arthralgia, and rash also reported

Indication and dose

Reversible airways obstruction (including nocturnal asthma and prevention of exercise-induced bronchospasm) in patients requiring long-term regular bronchodilator therapy see also Management of Chronic Asthma, p. 170

• By inhalation

Child 5–12 years 50 micrograms (2 puffs or 1 blister) twice daily

◁ SALMETEROL (continued)

Child 12–18 years 50 micrograms (2 puffs or 1 blister) twice daily; up to 100 micrograms (4 puffs or 2 blisters) twice daily in more severe airways obstruction

Counselling Advise children and carers that salmeterol should **not** be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor's advice should be obtained as soon as possible

Serevent® (A&H) (POM)

Accuhaler® (dry powder for inhalation), disk containing 60 blisters of salmeterol (as xinafoate) 50 micrograms/blister with **Accuhaler®** device, net price = £29.26. Counselling, dose

Evohaler® aerosol inhalation, salmeterol (as xinafoate) 25 micrograms/metered inhalation, net price 120-dose unit = £29.26. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-13Ha (a non-CFC propellant)

Diskhaler® (dry powder for inhalation), disks containing 4 blisters of salmeterol (as xinafoate) 50 micrograms/blister, net price 15 disks with **Diskhaler®** device = £35.79, 15-disk refill = £35.15. Counselling, dose, change to CFC-free inhaler

▲ Compound preparations

For **compound preparations** containing salmeterol, see section 3.2

TERBUTALINE SULPHATE

Cautions see notes above

Side-effects see notes above

Licensed use tablets not licensed for use in children under 7 years; injection not licensed for use in children under 2 years

Indication and dose

Acute asthma

- **By inhalation of nebulised solution**
see Management of Acute Asthma, p. 168
- **By subcutaneous or slow intravenous injection**

Child 2–15 years 10 micrograms/kg (max. 300 micrograms) up to 4 times daily

Child 15–18 years 250–500 micrograms up to 4 times daily

- **By continuous intravenous infusion**
Child 1 month–18 years initially 2–4 micrograms/kg as a loading dose, then 1–10 micrograms/kg/hour according to response and heart rate (doses above 10 micrograms/kg/hour with close monitoring)

Exacerbations of reversible airways obstruction (including nocturnal asthma) and prevention of exercise-induced bronchospasm see Management of Chronic Asthma, p. 170

- **By inhalation of powder**
Child 5–18 years 500 micrograms (1 inhalation) up to 4 times daily (for occasional use only)
- **By mouth (but not recommended)**
Child 1 month–7 years 75 micrograms/kg (max. 2.5 mg) 3 times daily
Child 7–15 years 2.5 mg 2–3 times daily
Child 15–18 years initially 2.5 mg 3 times daily, increased if necessary to 5 mg 3 times daily

Administration For **continuous intravenous infusion**, dilute to a concentration of 5 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; if fluid-restricted, dilute to a concentration of 100 micrograms/mL

For **nebulisation**, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation.

▲ Oral and parenteral

Bricanyl® (AstraZeneca) (POM)

Tablets, scored, terbutaline sulphate 5 mg, net price 20 = 82p

Syrup, sugar-free, terbutaline sulphate 1.5 mg/5 mL, net price 100 mL = £2.00

Injection, terbutaline sulphate 500 micrograms/mL, net price 1-mL amp = 30p; 5-mL amp = £1.40

▲ Inhalation

Counselling Advise children and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible

Bricanyl® (AstraZeneca) (POM)

Turbohaler® (= dry powder inhaler), terbutaline sulphate 500 micrograms/metered inhalation, net price 100-dose unit = £6.92. Counselling, dose

Respules® (= single-dose units for nebulisation), terbutaline sulphate 2.5 mg/mL, net price 20 × 2-mL units (5-mg) = £4.04

3.1.1.2 Other adrenoceptor agonists

Adrenaline (epinephrine) injection (1 in 1000) is used in the emergency treatment of acute allergic and anaphylactic reactions (section 3.4.3), in angioedema (section 3.4.3), and in cardiopulmonary resuscitation (section 2.7.3). Adrenaline solution (1 in 1000) is used by nebulisation in the management of severe croup (section 3.1).

3.1.2 Antimuscarinic bronchodilators

Ipratropium by nebulisation can be added to other standard treatment in life-threatening acute asthma or if acute asthma fails to improve with standard therapy (see Management of Acute Asthma, p. 168). Ipratropium can be used to provide short-term relief in chronic asthma, but short-acting beta₂ agonists act more quickly and are preferred.

The aerosol inhalation of ipratropium has a maximum effect 30–60 minutes after use; its duration of action is 3 to 6 hours.

IPRATROPIUM BROMIDE

Cautions risk of glaucoma (see below), bladder outflow obstruction; **interactions:** Appendix 1 (antimuscarinics)

Glaucoma *Acute angle-closure glaucoma* reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta₂ agonists); care needed to protect the child's eyes from nebulised drug or from drug powder

Side-effects dry mouth; *less commonly* nausea and headache; *rarely* constipation, tachycardia, palpitation, paradoxical bronchospasm, urinary retention, blurred vision, angle-closure glaucoma, and hypersensitivity reactions including rash, urticaria, and angioedema

Indication and dose

Acute asthma

- **By inhalation of nebulised solution**
See Management of Acute Asthma, section 3.1

Reversible airways obstruction see notes above

- **By aerosol inhalation**

Child 1 month–6 years 20 micrograms 3 times daily

Child 6–12 years 20–40 micrograms 3 times daily

Child 12–18 years 20–40 micrograms 3–4 times daily

- **By inhalation of powder**

Child 12–18 years 40 micrograms 3–4 times daily (dose may be doubled in less responsive condition)

Counselling Advise child and carer not to exceed prescribed dose and to follow manufacturer's directions

Rhinitis section 12.2.2

Ipratropium Bromide (Non-proprietary) ^(PwM)

Nebuliser solution, ipratropium bromide 250 micrograms/mL, net price 20 × 1-mL (250-microgram) unit-dose vials = £6.75, 60 × 1-mL = £21.78; 20 × 2-mL (500-microgram) = £7.43, 60 × 2-mL = £26.97

Atrovent[®] (Boehringer Ingelheim) ^(PwM)

Aerocaps[®] (dry powder for inhalation; for use with *Atrovent Aerohaler[®]*), green, ipratropium bromide 40 micrograms, net price pack of 100 caps with *Aerohaler[®]* = £14.53; 100 caps = £10.53. Counselling, dose

Note One *Atrovent Aerocap[®]* is equivalent to 2 puffs of *Atrovent[®]* metered aerosol inhalation

Aerosol inhalation ▼, ipratropium bromide 20 micrograms/metered inhalation, net price 200-dose unit = £4.21. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant)

Nebuliser solution, isotonic, ipratropium bromide 250 micrograms/mL, net price 20 × 1-mL unit-dose vials = £5.18, 60 × 1-mL vials = £15.55; 20 × 2-mL vials = £6.08, 60 × 2-mL vials = £18.24

Ipratropium Steri-Neb[®] (IVAX) ^(PwM)

Nebuliser solution, isotonic, ipratropium bromide 250 micrograms/mL, net price 20 × 1-mL (250-microgram) unit-dose vials = £8.72; 20 × 2-mL (500-microgram) = £9.94

Respontin[®] (A&H) ^(PwM)

Nebuliser solution, isotonic, ipratropium bromide 250 micrograms/mL, net price 20 × 1-mL (250-microgram) unit-dose vials = £5.07; 20 × 2-mL (500-microgram) = £5.95

3.1.3 Theophylline

Theophylline is a bronchodilator used for asthma, see Management of Chronic Asthma p. 170. It may have an additive effect when used in conjunction with small doses of beta₂ agonists; the combination may increase the risk of side-effects, including hypokalaemia (see p. 173).

Theophylline is given by injection as **aminophylline**, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is rarely needed for severe attacks of asthma (see Management of Acute Asthma, section 3.1). It must be given by **very slow** intravenous injection (over at least 20 minutes) or by intravenous infusion; it is too irritant for intramuscular use. Intravenous aminophylline may be used as a respiratory stimulant in neonates with apnoea, but **caffeine** (section 3.5.1) is usually preferred. Measurement of plasma-theophylline concentration may be helpful and is **essential** if a loading dose of aminophylline is to be given to children who are taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity.

Theophylline is metabolised in the liver. Plasma-theophylline concentration is *increased* in heart failure, cirrhosis, viral infections, and by drugs that inhibit its metabolism. The plasma-theophylline concentration is *decreased* in smokers and by drugs that induce liver metabolism. Particular care is required when introducing or withdrawing drugs that interact with theophylline. For other interactions of theophylline see Appendix 1.

Plasma-theophylline concentration In most individuals a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, but a lower concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase if the concentration exceeds 20 mg/litre. In neonates, toxic symptoms sometimes occur when the plasma-theophylline concentration exceeds 14 mg/litre (78 micromol/litre). If theophylline is used in the treatment of *neonatal apnoea*, the usual target range is 8–12 mg/litre (44–66 micromol/litre).

Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should be taken 1–2 hours after an oral dose (after 4–6 hours in the case of a modified-release preparation). If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment; in a child already taking theophylline, plasma-theophylline concentration should be determined before giving the intravenous dose.

THEOPHYLLINE

Cautions cardiac disease, hypertension, hyperthyroidism; peptic ulcer; epilepsy; fever; **CSM** advice on hypokalaemia risk, p. 173; avoid in acute porphyria (section 9.8.2); monitor plasma-theophylline concentration (see notes above); **interactions:** Appendix 1 (theophylline) and notes above

Hepatic impairment reduce dose

Pregnancy neonatal irritability and apnoea reported

Breast-feeding present in milk—irritability in infant reported; modified-release preparations preferable

Side-effects tachycardia, palpitation, nausea and other gastro-intestinal disturbances, headache, CNS stimulation, insomnia, arrhythmias, and convulsions especially if given rapidly by intravenous injection; **overdosage:** see Emergency Treatment of Poisoning, p. 43

Licensed use *Slo-Phyllin*® capsules not licensed for use in children under 2 years

Indication and dose

Chronic asthma

see under preparations below and Management of Chronic Asthma p. 170

Note Plasma-theophylline concentration for optimum response 10–20 mg/litre (55–110 micromol/litre); narrow margin between therapeutic and toxic dose, see also notes above

Modified release

Note The rate of absorption from modified-release preparations can vary between different brands. The Council of the Royal Pharmaceutical Society of Great Britain advises pharmacists that if a general practitioner prescribes a modified-release oral theophylline preparation without specifying a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Addition-

ally, it is essential that a child discharged from hospital should be maintained on the brand on which that child was stabilised as an in-patient.

Nuelin SA® (3M)

SA tablets, m/r, theophylline 175 mg. Net price 60-tab pack = £3.19. Label: 21, 25

Dose

Chronic asthma

• By mouth

Child 6–12 years 175 mg every 12 hours

Child 12–18 years 175–350 mg every 12 hours

SA 250 tablets, m/r, scored, theophylline 250 mg. Net price 60-tab pack = £4.46. Label: 21, 25

Dose

Chronic asthma

• By mouth

Child 6–12 years 125–250 mg every 12 hours

Child 12–18 years 250–500 mg every 12 hours

Slo-Phyllin® (Merck)

Capsules, m/r, theophylline 60 mg (white/clear, enclosing white pellets), net price 56-cap pack = £2.76; 125 mg (brown/clear, enclosing white pellets), 56-cap pack = £3.48; 250 mg (blue/clear, enclosing white pellets), 56-cap pack = £4.34. Label: 25, or counselling, see below

Dose

Chronic asthma

• By mouth

Child 6 months–2 years (body-weight under 10 kg) 12 mg/kg every 12 hours

Child 2–6 years (body-weight over 10 kg) 60–120 mg every 12 hours

Child 6–12 years 125–250 mg every 12 hours

Child 12–18 years 250–500 mg every 12 hours

Administration Contents of the capsule (enteric-coated granules) may be sprinkled on to a spoonful of soft food (e.g. yoghurt) and swallowed without chewing

□ THEOPHYLLINE (continued)

Uniphyllin Continus® (Napp)

Tablets, m/r, scored, theophylline 200 mg, net price 56-tab pack = £3.13; 300 mg, 56-tab pack = £4.77; 400 mg, 56-tab pack = £5.65. Label: 25

Dose

Chronic asthma

• By mouth

Child 2–12 years 9 mg/kg (up to 200 mg) every 12 hours; some children with chronic asthma may require 10–16 mg/kg (max. 400 mg) every 12 hours

Child 12–18 years 200 mg every 12 hours, increased according to response to 400 mg every 12 hours

Note May be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in children whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as a single evening or morning dose

AMINOPHYLLINE

Note Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water

Cautions see under Theophylline; also rapid intravenous injection can cause arrhythmias

Side-effects see under Theophylline; also allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis

Licensed use *Minijet® Aminophylline* not licensed for use in children under 6 months

Indication and dose

Note To avoid excessive dosage in obese children, dose should be calculated on the basis of ideal weight for height

Chronic asthma (see also Management of Chronic Asthma, p. 170)

• By mouth

See under preparations below

Severe acute asthma not previously treated with theophylline (with close monitoring; see also Management of Acute Asthma, section 3.1)

• By intravenous injection over at least 20 minutes

Child 1 month–18 years 5 mg/kg (max. 500 mg) then by intravenous infusion

Severe acute asthma (with close monitoring; see also Management of Acute Asthma, section 3.1)

• By intravenous infusion

Child 1 month–9 years 1 mg/kg/hour adjusted according to plasma-theophylline concentration

Child 9–16 years 800 micrograms/kg/hour adjusted according to plasma-theophylline concentration

Child 16–18 years 500 micrograms/kg/hour adjusted according to plasma-theophylline concentration

Note Plasma-theophylline concentration for optimum response in asthma 10–20 mg/litre (55–110 micromol/litre); narrow margin between therapeutic and toxic dose,

see also notes above on plasma-theophylline concentration; children taking oral theophylline or aminophylline should not normally receive intravenous aminophylline unless plasma-theophylline concentration is available to guide dosage

Neonatal apnoea (but see notes above)

• By intravenous injection over 20 minutes

Neonate initially 6 mg/kg, then 2.5 mg/kg every 12 hours (increased if necessary to 3.5 mg/kg every 12 hours)

Note Plasma-theophylline concentration for optimum response in neonatal apnoea 8–12 mg/litre (44–66 micromol/litre), see also notes above

Administration For *intravenous infusion*, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%

Aminophylline (Non-proprietary) (POM)

Injection, aminophylline 25 mg/mL, net price 10-mL amp = 72p

Brands include *Minijet® Aminophylline*

Injection, aminophylline 2 mg/mL, 20-mL amp; 5 mg/mL, 20-mL amp

Available from 'special-order' manufacturers or specialist importing companies, see p. 943

▲ Modified release

Note Advice about modified-release theophylline preparations on p. 179 also applies to modified-release aminophylline preparations

Phyllocontin Continus® (Napp)

Tablets, m/r, yellow, f/c, aminophylline hydrate 225 mg, net price 56-tab pack = £2.54. Label: 25

Dose

Chronic asthma (see also Management of Chronic Asthma, p. 170)

• By mouth

Child body-weight over 40 kg initially 1 tablet twice daily, increased after 1 week to 2 tablets twice daily according to plasma-theophylline concentration

Note Brands of modified-release tablets containing aminophylline 225 mg include *Norphyllin® SR*

3.1.4 Compound bronchodilator preparations

In general, children are best treated with single-ingredient preparations, such as a selective beta₂ agonist (section 3.1.1.1) or ipratropium bromide (section 3.1.2), so that the dose of each drug can be adjusted. This flexibility is lost with compound bronchodilator preparations.

3.1.5 Peak flow meters, inhaler devices, and nebulisers

Peak flow meters

Peak flow meters may be used to assess lung function in children over 5 years with asthma, but symptom monitoring is the most reliable assessment of asthma control. They are best used for short periods to assess the severity of asthma and to monitor response to treatment; continuous use of peak flow meters may detract from compliance with inhalers.

Standard Range Peak Flow Meter

Conforms to standard EN 13826

MicroPeak[®], range 60–800 litres/minute, net price = £6.50, replacement mouthpiece = 38p (Micro Medical)

Mini-Wright[®], range 60–800 litres/minute, net price = £6.86, replacement mouthpiece = 38p (Clement Clarke)

Piko-1[®], range 15–999 litres/minute, net price = £9.50, replacement mouthpiece = 38p (nSPIRE Health)

Pocketpeak[®], range 60–800 litres/minute, net price = £6.53, replacement mouthpiece = 38p (nSPIRE Health)

Vitalograph[®], range 50–800 litres/minute, net price = £4.50 (a child's peak flow meter is also available), replacement mouthpiece = 40p (Vitalograph)

Note Readings from new peak flow meters are often lower than those obtained from old Wright-scale peak flow meters and the correct recording chart should be used

Low Range Peak Flow Meter

Compliant to standard EN 13826 except for scale range

Mini-Wright[®], range 30–400 litres/minute, net price = £6.90, replacement mouthpiece = 38p (Clement Clarke)

Pocketpeak[®], range 50–400 litres/minute, net price = £6.53, replacement mouthpiece = 38p (nSPIRE Health)

Note Readings from new peak flow meters are often lower than those obtained from old Wright-scale peak flow meters and the correct recording chart should be used

Drug delivery devices

Inhaler devices A *pressurised metered-dose inhaler* is an effective method of drug administration in mild to moderate chronic asthma; to deliver the drug effectively, a spacer device should also be used (see also NICE guidance, below). By the age of 3 years, a child can usually be taught to use the spacer device without a mask. As soon as a child is able to use the mouthpiece, then this is the preferred delivery system.

Dry powder inhalers may be useful in children over 5 years, who are unwilling or unable to use a pressurised metered-dose inhaler with a spacer device; breath-actuated inhalers may be useful in older children if they are able to use the device effectively. The child or child's carer should be instructed carefully on the use of the inhaler. It is important to check that the inhaler is being used correctly; poor inhalation technique may be mistaken for a lack of response to the drug.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, the child may notice a lack of sensation in the mouth and throat previously associated with each actuation; coughing may occur more frequently following use of a dry-powder inhaler.

CFC-free metered-dose inhalers should be cleaned **weekly** according to the manufacturer's instructions.

NICE guidance

Inhaler devices for children with chronic asthma (children under 5 years, August 2000; children 5–15 years, March 2002)

A child's needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

For children aged under 5 years:

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler **and** spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child's condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered [but see notes above].

For children aged 5–15 years:

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler **and** spacer device;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored.

Spacer devices Spacer devices are particularly useful for infants, for children with poor inhalation technique, or for nocturnal asthma, because the device reduces the need for co-ordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Smaller-volume spacers may be more manageable for pre-school children and infants. The spacer device used must be compatible with the prescribed metered-dose inhaler.

Use and care of spacer devices The suitability of the spacer device should be carefully assessed; opening the one-way valve is dependent on the child's inspiratory flow. Some devices can be tipped to 45° to open the valve during inhaler actuation and inspiration to assist the child.

Inhalation from the spacer device should follow the actuation as soon as possible because the drug aerosol is very short-lived. The total dose (which may be more than a single puff) should be administered as single actuations (tidal breathing for 10–20 seconds or 5–6 breaths between each actuation) for children with good inspiratory flow. Larger doses may be necessary for a child with acute bronchospasm; for guidance on the Management of Acute Asthma, see section 3.1.

The device should be cleansed once a month by washing in mild detergent and then allowed to dry in air; the mouthpiece should be wiped clean of detergent before use. More frequent cleaning should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Able Spacer® (Clement Clarke)

Spacer device, small-volume device. For use with all pressurised (aerosol) inhalers, net price standard device = £4.20; with infant, child or adult mask = £6.86

AeroChamber® Plus (GSK)

Spacer device, medium-volume device. For use with all pressurised (aerosol) inhalers, net price standard device (blue) = £4.43, with mask (blue) = £7.40; infant device (orange) with mask = £7.40; child device (yellow) with mask = £7.40

Babyhaler® (A&H) 

Spacer device, paediatric use with *Flixotide®*, *Seretide®*, *Serevent®*, and *Ventolin®* inhalers, net price = £11.34

Haleraid® (A&H)

Inhalation aid, device to place over pressurised (aerosol) inhalers to aid when strength in hands is impaired (e.g. arthritis). For use with *Flixotide®*, *Seretide®*, *Serevent®*, and *Ventolin®* inhalers. Available as *Haleraid®-120* for 120-dose inhalers and *Haleraid®-200* for 200-dose inhalers, net price = 80p

NebuChamber® (AstraZeneca)

Spacer device, for use with *Pulmicort®* aerosol inhalers, net price = £8.56.

Nebuhaler® (AstraZeneca)

Spacer device, large-volume device. For use with *Pulmicort®* inhalers, net price with paediatric mask = £4.28

Optichamber® (Respironics)

Spacer device, for use with all pressurised (aerosol) inhalers, net price = £4.28; with small or medium mask = £7.40 

PARI Vortex Spacer® (Pari) 

Spacer device, medium-volume device. For use with all pressurised (aerosol) inhalers, net price with mouthpiece = £6.07 ; with mask for infant or child = £7.91; with adult mask = £9.97 

Pocket Chamber® (nSPIRE Health)

Spacer device, small-volume device. For use with all pressurised (aerosol) inhalers, net price = £4.18; with infant, small, medium, or large mask = £9.75

Volumatic® (A&H)

Spacer inhaler, large-volume device. For use with *Clenil Modulite®*, *Flixotide®*, *Seretide®*, *Serevent®*, and *Ventolin®* inhalers, net price = £2.75; with paediatric mask = £2.75

Nebulisers

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff). For details of jet nebulisers, home compressors with nebulisers, and compressors, see current BNF.

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are:

- to deliver a beta₂ agonist or ipratropium to a child with an *acute exacerbation* of asthma or of airways obstruction;
- to deliver *prophylactic medication* to a child unable to use other conventional devices;

- to deliver an antibacterial (such as colistin or tobramycin) to a child with chronic purulent infection (as in cystic fibrosis or bronchiectasis);
- to deliver budesonide to a child with severe croup;
- to deliver pentamidine for the prophylaxis and treatment of pneumocystis pneumonia to a child with AIDS.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30% it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or it is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on particle size. Particles with a median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma whereas a particle size of 1–2 microns is needed for alveolar deposition of pentamidine to combat pneumocystis infection. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution (antibacterial solutions usually being more viscous).

Some jet nebulisers are able to increase drug output during inspiration and hence increase efficiency.

Nebulised bronchodilators are appropriate for children with chronic persistent asthma or those with severe acute asthma. In chronic asthma, nebulised bronchodilators should only be used to relieve persistent daily wheeze (see Management of Chronic Asthma table, p. 170). The use of nebulisers in chronic persistent asthma should be considered only:

- after a review of the diagnosis and use of current inhaler devices;
- if the airflow obstruction is significantly reversible by bronchodilators without unacceptable side-effects;
- if the child does not benefit from use of conventional inhaler device, such as pressurised metered-dose inhaler plus spacer;
- if the child is complying with the prescribed dose and frequency of anti-inflammatory treatment including regular use of high-dose inhaled corticosteroid.

When a nebuliser is prescribed, the child or child's carer must:

- have clear instructions from doctor, specialist nurse or pharmacist on the use of the nebuliser (and on peak-flow monitoring—see notes above);
- be instructed not to treat acute attacks without also seeking medical help;
- have regular follow up with doctor or specialist nurse.

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should always be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

Safe practice

The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

For a list of available devices see BNF (section 3.1.5).

Nebuliser diluent

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

Sodium Chloride (Non-proprietary) (POM)

Nebuliser solution, sodium chloride 0.9%, net price
20 × 2.5 mL = £5.49

Brands include *Saline Steripoule*®, *Saline Steri-Neb*®

3.2 Corticosteroids

Corticosteroids are effective in the management of *asthma*; they reduce airway inflammation.

An inhaled corticosteroid is used regularly for prophylaxis of asthma when a child requires a beta₂ agonist more than twice a week, or if symptoms disturb sleep more than once a week, or if the child has suffered exacerbations in the last 2 years requiring a systemic corticosteroid or a nebulised bronchodilator (see Management of Chronic Asthma, p. 170).

In adults, current or previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary.

Corticosteroid inhalers must be used regularly for maximum benefit; alleviation of symptoms usually occurs 3 to 7 days after initiation but may take longer. **Beclometasone dipropionate** (beclomethasone dipropionate), **budesonide**, **fluticasone propionate**, and **mometasone furoate** appear to be equally effective. A spacer device should be used for administering inhaled corticosteroids in children under 15 years (see NICE guidance, section 3.1.5); a spacer device is also useful in children over 15 years, particularly if high doses are required.

High doses of inhaled corticosteroids can be prescribed for children who respond only partially to standard doses of an inhaled corticosteroid and a long-acting beta₂ agonist or to other long-acting bronchodilators (see Management of Chronic Asthma, p. 170). High doses should be continued only if there is clear benefit over the lower dose. The recommended maximum dose of an inhaled corticosteroid should not generally be exceeded; however, if a higher dose is required it should be initiated and supervised by a respiratory paediatrician. The use of high doses of an inhaled corticosteroid can minimise the requirement for an oral corticosteroid.

Cautions of inhaled corticosteroids Systemic therapy may be required during periods of stress, such as during severe infections, or when airways obstruction or mucus prevent drug access to smaller airways. An inhaled corticosteroid may be used during pregnancy and breast-feeding, see p. 168; **interactions:** Appendix 1 (corticosteroids).

Paradoxical bronchospasm The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind—mild bronchospasm may be prevented by inhalation of a short-acting beta₂ agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation if suitable).

CFC-free inhalers Chlorofluorocarbon (CFC) propellants in pressurised aerosol inhalers are being replaced by hydrofluoroalkane (HFA) propellants. Carers of children and children receiving CFC-free pressurised inhalers should be reassured about the efficacy of the new inhalers and counselled that the aerosol may feel and taste different; any difficulty with the new inhaler should be discussed with the doctor, asthma nurse specialist, or pharmacist.

Doses for CFC-free corticosteroid inhalers may be different from those that contain CFCs, see also MHRA/CHM advice below.

MHRA/CHM advice (July 2008)

Beclometasone dipropionate CFC-free pressurised metered-dose inhalers (*Qvar*[®] and *Clenil Modulite*[®]) are **not** interchangeable and should be prescribed by brand name; *Qvar*[®] has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers, and is approximately twice as potent as *Clenil Modulite*[®].

Side-effects of inhaled corticosteroids Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects have been reported.

High doses of inhaled corticosteroids (see Management of Chronic Asthma, p. 170) used for prolonged periods can induce adrenal suppression. Inhaled corticosteroids have occasionally been associated with adrenal crisis and coma in children; excessive doses should be **avoided**. Children using high doses of inhaled corticosteroids should be under the supervision of a paediatrician for the duration of the treatment; they should be given a 'steroid card' (section 6.3.2) and

specific written advice to consider corticosteroid replacement during an episode of stress, such as a severe intercurrent illness or an operation.

In adults, bone mineral density is sometimes reduced following long-term inhalation of higher doses of corticosteroids, predisposing patients to osteoporosis (section 6.6). It is, therefore, sensible to ensure that the dose of an inhaled corticosteroid is no higher than necessary to keep a child's asthma under good control.

Growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled corticosteroids; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. However, the CSM has recommended that the height of children receiving prolonged treatment with inhaled corticosteroid is monitored; if growth is slowed, referral to a paediatrician should be considered.

Hoarseness and candidiasis of the mouth or throat have been reported, usually only with high doses (see also below). Hypersensitivity reactions (including rash and angioedema) have been reported rarely. Other side-effects that have very rarely been reported include paradoxical bronchospasm, anxiety, depression, sleep disturbances, and behavioural changes including hyperactivity and irritability.

Candidiasis The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water (or cleaning the child's teeth) after inhalation of a dose may also be helpful. Antifungal oral suspension or lozenges (section 12.3.2) can be used to treat oral candidiasis while continuing corticosteroid therapy.

Oral An acute attack of asthma should be treated with a short course (3–5 days) of oral corticosteroid, see Management of Acute Asthma, p. 168. The dose can usually be stopped abruptly in a mild exacerbation of asthma (see also Withdrawal of Corticosteroids, section 6.3.2) but it should be reduced gradually in children with poorer asthma control, to reduce the possibility of serious relapse.

In chronic continuing asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms.

Parenteral For the use of hydrocortisone injection in the emergency treatment of acute severe asthma, see Management of Acute Asthma, p. 168.

BECLOMETASONE DIPROPIONATE

(Beclomethasone Dipropionate)

Cautions see notes above

Side-effects see notes above

Licensed use *Becodisk*[®]-400, *Clenil Modulate*[®]-200 and -250, and *Qvar*[®] are not licensed for use in children under 12 years

Indication and dose

Prophylaxis of asthma

see Management of Chronic Asthma, p. 170
Important for *Asmabec Clickhaler*[®], *Becodisks*[®], and *Qvar*[®] doses see under preparations below

Beclometasone (Non-proprietary) (POM)

Aerosol inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £5.69; 100 micrograms/metered inhalation, 200-dose unit = £9.91; 200 micrograms/metered inhalation, 200-dose unit = £17.25; 250 micrograms/metered inhalation, 200-dose unit

= £22.88. Label: 8, counselling, dose; also 10 and steroid card with high doses

Excipients include CFC propellants

Brands include *Beclazone*[®]

Dry powder for inhalation, beclometasone dipropionate 100 micrograms/metered inhalation, net price 100-dose unit = £5.58; 200 micrograms/metered inhalation, 100-dose unit = £10.29, 200-dose unit = £15.60; 400 micrograms/metered inhalation, 100-dose unit = £20.41. Label: 8, counselling, dose; also 10 and steroid card with high doses

Brands include *Pulvinat*[®] *Beclometasone Dipropionate*, *Easyhaler*[®] *Beclometasone Dipropionate*

Inhalation powder, hard capsule (for use with *Cyclohaler*[®] device), beclometasone dipropionate 100 micrograms, net price 120-cap pack = £15.99; 200 micrograms, 120-cap pack = £25.00; 400 micrograms, 120-cap pack = £32.25. Label: 8, counselling, dose; also 10 and steroid card with high doses
Brands include *Beclometasone Cyclocaps*[®]

◊ BECLOMETASONE DIPROPIONATE (continued)

Asmabec Clickhaler® (UCB Pharma) (POM)

Dry powder for inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £6.68; 100 micrograms/metered inhalation, 200-dose unit = £9.81; 250 micrograms/metered inhalation, 100-dose unit = £12.31. Label: 8, counselling, dose; also 10 and steroid card with high doses

Dose

Prophylaxis of asthma

• By inhalation of powder

Child 6–12 years 50–200 micrograms twice daily, adjusted as necessary

Child 12–18 years 100–400 micrograms twice daily, adjusted as necessary; max. 1 mg twice daily

Beclazone Easi-Breathe® (IVAX) (POM)

Aerosol inhalation (breath-actuated), beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £3.26; 100 micrograms/metered inhalation, 200-dose unit = £10.30; 250 micrograms/metered inhalation, 200-dose unit = £20.25. Label: 8, counselling, dose; also 10 and steroid card with high doses
Excipients include CFC propellants

Becodisks® (A&H) (POM)

Dry powder for inhalation, disks containing 8 blisters of beclometasone dipropionate 100 micrograms/blister, net price 15 disks with *Diskhaler*® device = £12.00, 15-disk refill = £11.42; 200 micrograms/blister, 15 disks with *Diskhaler*® device = £22.87, 15-disk refill = £22.28; 400 micrograms/blister, 15 disks with *Diskhaler*® device = £45.14, 15-disk refill = £44.57. Label: 8, counselling, dose; also 10 and steroid card with high doses

Dose

Prophylaxis of asthma

• By inhalation of powder

Child 5–12 years 100–200 micrograms twice daily, adjusted as necessary

Child 12–18 years 400–800 micrograms twice daily, adjusted as necessary

Clenil Modulite® (Chiesi) ▼ (POM)

Aerosol inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £3.85; 100 micrograms/metered inhalation = £7.72; 200 micrograms/metered inhalation = £16.83; 250 micrograms/metered inhalation = £16.95. Label: 8, counselling, dose; also 10 and steroid card with high doses
Excipients include HFA-134a (a non-CFC propellant)

Dose

Prophylaxis of asthma

• By aerosol inhalation

Child 2–12 years 100–200 micrograms twice daily

Child 12–18 years 200–400 micrograms twice daily adjusted as necessary up to 1 mg twice daily

Note *Clenil Modulite*® is not interchangeable with other CFC-free beclometasone dipropionate inhalers; the MHRA has advised (August 2006 and July 2008) that CFC-free beclometasone dipropionate inhalers should be prescribed by brand name

Dental prescribing on NHS *Clenil Modulite*® 50 micrograms/metered inhalation may be prescribed

Qvar® (IVAX) (POM)

Aerosol inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £7.87; 100 micrograms/metered inhalation, 200-dose unit = £17.21. Label: 8, counselling, dose; also 10 and steroid card with high doses
Excipients include HFA-134a (a non-CFC propellant)

Autohaler® (breath-actuated aerosol inhalation), beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £7.87; 100 micrograms/metered inhalation, 200-dose unit = £17.21. Label: 8, counselling, dose; also 10 and steroid card with high doses
Excipients include HFA-134a (a non-CFC propellant)

Easi-Breathe® (breath-actuated aerosol inhalation), beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose = £7.74; 100 micrograms/metered inhalation, 200-dose = £16.95. Label: 8, counselling, dose; also 10 and steroid card with high doses
Excipients include HFA-134a (a non-CFC propellant)

Dose

Prophylaxis of asthma

• By aerosol inhalation

Child 12–18 years 50–200 micrograms twice daily, increased if necessary to max. 400 micrograms twice daily

Important When switching a child with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Qvar*® should be prescribed for:

- 200–250 micrograms of beclometasone dipropionate or budesonide
- 100 micrograms of fluticasone propionate

When switching a child with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of *Qvar*® should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of *Qvar*® should be adjusted according to response

Note The MHRA has advised (August 2006 and July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name

BUDESONIDE

Cautions see notes above

Side-effects see notes above

Licensed use *Pulmicort*® nebuliser solution not licensed for use in children under 3 months; not licensed for use in bronchopulmonary dysplasia

Indication and dose

Prophylaxis of asthma see Management of Chronic Asthma, p. 170, and preparations below

Croup

• By inhalation of nebuliser suspension

Child over 1 month 2 mg as single dose or in 2 divided doses separated by 30 minutes; dose may be repeated after 12 hours if necessary

▢ BUDESONIDE (continued)

Bronchopulmonary dysplasia with assisted ventilation

- By aerosol inhalation

Neonate 400 micrograms twice daily

Child 1–4 months 400 micrograms twice daily

Bronchopulmonary dysplasia with spontaneous respiration

- By inhalation of nebuliser suspension

Neonate 500 micrograms twice daily

Child 1–4 months 500 micrograms twice daily; for severe symptoms in child body-weight 2.5 kg or over, 1 mg twice daily

Administration For *aerosol inhalation* in ventilated babies with bronchopulmonary dysplasia, use medium-volume spacer (section 3.1.5) attached directly to endotracheal tube; hand-ventilate through spacer, using a bag system; inflate chest 10 times between activations of inhaler

Budesonide (Non-proprietary) ^(POM)

Dry powder for inhalation, budesonide 100 micrograms/metered inhalation, net price 200-dose unit = £9.25; 200 micrograms/metered inhalation 200-dose unit = £18.50; 400 micrograms/metered inhalation 100-dose unit = £18.50. Label: 8, counselling, dose; also 10 and steroid card with high doses

Brands include *Easzyhaler® Budesonide*

Inhalation powder, hard capsule (for use with *Cyclohaler®* device), budesonide 200 micrograms, net price 100-cap pack = £15.48; 400 micrograms, 50-cap pack = £15.48. Label: 8, counselling, dose; also 10 and steroid card with high doses

Brands include *Budesonide Cyclocaps®*

Dose

Prophylaxis of asthma

- By inhalation of powder

Child 6–12 years 100–400 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, 200–400 micrograms as a single dose each evening if stabilised on daily dose given in 2 divided doses

Child 12–18 years 100–800 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, 200–400 micrograms as a single dose each evening if stabilised on daily dose given in 2 divided doses (max. 800 micrograms)

Novolizer® (Viatris) ^(POM)

Dry powder for inhalation, budesonide 200 micrograms, net price refillable inhaler device and 100-dose cartridge = £14.86; 100-dose refill cartridge = £9.59. Label: 8, counselling, dose; also 10 and steroid card with high doses

Dose

Prophylaxis of asthma

- By inhalation of powder

Child 6–12 years 200–400 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, 200–400 micrograms as a single dose each evening if stabilised on daily dose given in 2 divided doses

Child 12–18 years 200–800 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, 200–400 micrograms as a single dose each evening if stabilised on daily dose given in 2 divided doses (max. 800 micrograms)

Pulmicort® (AstraZeneca) ^(POM)

Aerosol inhalation ▼, budesonide 100 micrograms/metered inhalation, net price 120-dose unit = £9.60; 200 micrograms/metered inhalation, net price 120-dose unit = £13.20. Label: 8, counselling, dose, change to CFC-free inhaler; also 10 and steroid card with high doses

Excipients include HFA-134a (a non-CFC propellant)

Dose

Prophylaxis of asthma

- By aerosol inhalation

Child 2–12 years 100–400 micrograms twice daily, adjusted as necessary

Child 12–18 years 100–400 micrograms twice daily, adjusted as necessary; max. 800 micrograms twice daily

Turbohaler® (= dry powder inhaler), budesonide 100 micrograms/metered inhalation, net price 200-dose unit = £18.50; 200 micrograms/metered inhalation, 100-dose unit = £18.50; 400 micrograms/metered inhalation, 50-dose unit = £18.50. Label: 8, counselling, dose; also 10 and steroid card with high doses

Dose

Prophylaxis of asthma

- By inhalation of powder

Child 6–12 years 100–400 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, 200–400 micrograms as a single dose each evening if stabilised on daily dose given in 2 divided doses

Child 12–18 years 100–800 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, 200–400 micrograms as a single dose each evening if stabilised on daily dose given in 2 divided doses (max. 800 micrograms)

Respules® (= single-dose units for nebulisation), budesonide 250 micrograms/mL, net price 20 × 2-mL (500-microgram) unit = £32.00; 500 micrograms/mL, 20 × 2-mL (1-mg) unit = £44.64. May be diluted with sterile sodium chloride 0.9%. Label: 8, counselling, dose, 10, steroid card

Dose

Prophylaxis of asthma

- By inhalation of nebuliser suspension

Child 3 months–12 years initially 0.5–1 mg twice daily, reduced to 250–500 micrograms twice daily

Child 12–18 years initially 1–2 mg twice daily, reduced to 0.5–1 mg twice daily

▢ Compound preparations

Symbicort® (AstraZeneca) ^(POM)

Symbicort 100/6 Turbohaler® (= dry powder inhaler), budesonide 100 micrograms, formoterol fumarate 6 micrograms/metered inhalation, net price 120-dose unit = £33.00. Label: 8, counselling, dose

Dose

Prophylaxis of asthma

- By inhalation of powder

Child 6–12 years 2 puffs twice daily reduced to 1 puff once daily if control maintained

Child 12–18 years 1–2 puffs twice daily reduced to 1 puff once daily if control maintained

BUDESONIDE (continued)

Symbicort 200/6 Turbohaler® (= dry powder inhaler), budesonide 200 micrograms, formoterol fumarate 6 micrograms/metered inhalation, net price 120-dose unit = £38.00. Label: 8, counselling, dose; also 10 and steroid card with high doses

Dose

Prophylaxis of asthma

- By inhalation of powder

Child 12–18 years 1–2 puffs twice daily reduced in well-controlled asthma to 1 puff once daily

Symbicort 400/12 Turbohaler® (= dry powder inhaler), budesonide 400 micrograms, formoterol fumarate 12 micrograms/metered inhalation, net price 60-dose unit = £38.00. Label: 8, counselling, dose; also 10 and steroid card with high doses

Dose

Prophylaxis of asthma

- By inhalation of powder

Child 12–18 years 1 puff twice daily; may be reduced in well-controlled asthma to 1 puff once daily

CICLESONIDE

Cautions see notes above

Side-effects see notes above

Indication and dose

Prophylaxis of asthma

- By aerosol inhalation

Child 12–18 years 160 micrograms daily as a single dose reduced to 80 micrograms daily if control maintained

Alvesco® (Nycomed) ▼ ^(PAM)

Aerosol inhalation, ciclesonide 80 micrograms/metered inhalation, net price 120-dose unit = £28.56; 160 micrograms/metered inhalation, 60-dose unit = £16.80, 120-dose unit = £33.60. Label: 8, counselling, dose

Excipients include HFA-134a (a non-CFC propellant)

FLUTICASONE PROPIONATE

Cautions see notes above

Side-effects see notes above; also *very rarely* dyspepsia, hyperglycaemia, and arthralgia

Indication and dose

Prophylaxis of asthma see Management of Chronic Asthma, p. 170, and preparations below

Evohaler® *aerosol inhalation*, fluticasone propionate 50 micrograms/metered inhalation, net price 120-dose unit = £5.44; 125 micrograms/metered inhalation, 120-dose unit = £21.26; 250 micrograms/metered inhalation, 120-dose unit = £36.14. Label: 8, counselling, dose, change to CFC-free inhaler; also 10 and steroid card with high doses

Excipients include HFA-134a (a non-CFC propellant)

Flixotide® (A&H) ^(PAM)

Accuhaler® (dry powder for inhalation), disk containing 60 blisters of *fluticasone propionate* 50 micrograms/bliſter with *Accuhaler®* device, net price = £6.38; 100 micrograms/bliſter with *Accuhaler®* device = £8.93; 250 micrograms/bliſter with *Accuhaler®* device = £21.26; 500 micrograms/bliſter with *Accuhaler®* device = £36.14. Label: 8, counselling, dose; also 10 and steroid card with high doses

Dose

Prophylaxis of asthma

- By inhalation of powder

Child 5–16 years 50–100 micrograms twice daily adjusted as necessary; max. 200 micrograms twice daily

Child 16–18 years 100–500 micrograms twice daily, adjusted as necessary; max. 1 mg twice daily

Dose

Prophylaxis of asthma

- By aerosol inhalation

Child 4–16 years 50–100 micrograms twice daily adjusted as necessary; max. 200 micrograms twice daily

Child 16–18 years 100–500 micrograms twice daily adjusted as necessary; max. 1 mg twice daily

Nebules® (= single-dose units for nebulisation)

fluticasone propionate 250 micrograms/mL, net price 10 × 2-mL (500-microgram) unit = £9.34; 1 mg/mL, 10 × 2-mL (2-mg) unit = £37.35. May be diluted with sterile sodium chloride 0.9%. Label: 8, counselling, dose, 10, steroid card

Dose

Prophylaxis of asthma

- By inhalation of nebuliser suspension

Child 4–16 years 1 mg twice daily

Child 16–18 years 0.5–2 mg twice daily

Diskhaler® (dry powder for inhalation), fluticasone propionate 100 micrograms/bliſter, net price 15 disks of 4 blisters with *Diskhaler®* device = £12.71, 15-disk refill = £12.18; 250 micrograms/bliſter, 15 disks of 4 blisters with *Diskhaler®* device = £24.11, 15-disk refill = £23.58; 500 micrograms/bliſter, 15 disks of 4 blisters with *Diskhaler®* device = £40.05, 15-disk refill = £39.52. Label: 8, counselling, dose; also 10 and steroid card with high doses

Dose

Prophylaxis of asthma

- By inhalation of powder

Child 5–16 years 100–200 micrograms twice daily

Child 16–18 years 100–500 micrograms twice daily adjusted as necessary; max. 1 mg twice daily

Compound preparations

Seretide® (A&H) ^(PAM)

Seretide 100 Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 100 micrograms, salmeterol (as xinafoate) 50 micrograms/bliſter with *Accuhaler®* device, net price = £31.19. Label: 8, counselling, dose

Dose

Prophylaxis of asthma

- By inhalation of powder

Child 5–18 years 1 bliſter twice daily, reduced to 1 bliſter once daily if control maintained

FLUTICASONE PROPIONATE (continued)

Seretide 250 Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 250 micrograms, salmeterol (as xinafoate) 50 micrograms/blister with Accuhaler® device, net price = £36.65. Label: 8, counselling, dose, 10, steroid card

Dose

Prophylaxis of asthma

- By inhalation of powder

Child 12–18 years 1 blister twice daily

Seretide 500 Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 500 micrograms, salmeterol (as xinafoate) 50 micrograms/blister with Accuhaler® device, net price = £40.92. Label: 8, counselling, dose, 10, steroid card

Dose

Prophylaxis of asthma

- By inhalation of powder

Child 12–18 years 1 blister twice daily

Seretide 50 Evohaler® (aerosol inhalation), fluticasone propionate 50 micrograms, salmeterol (as xinafoate) 25 micrograms/metered inhalation, net price 120-dose unit = £18.14. Label: 8, counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant)

Dose

Prophylaxis of asthma

- By aerosol inhalation

Child 5–18 years 2 puffs twice daily, reduced to 2 puffs once daily if control maintained

Seretide 125 Evohaler® (aerosol inhalation), fluticasone propionate 125 micrograms, salmeterol (as xinafoate) 25 micrograms/metered inhalation, net price 120-dose unit = £36.65. Label: 8, counselling, dose, change to CFC-free inhaler, 10, steroid card

Excipients include HFA-134a (a non-CFC propellant)

Dose

Prophylaxis of asthma

- By aerosol inhalation

Child 12–18 years 2 puffs twice daily

Seretide 250 Evohaler® (aerosol inhalation), fluticasone propionate 250 micrograms, salmeterol (as xinafoate) 25 micrograms/metered inhalation, net price 120-dose unit = £62.29. Label: 8, counselling, dose, change to CFC-free inhaler, 10, steroid card

Excipients include HFA-134a (a non-CFC propellant)

Dose

Prophylaxis of asthma

- By aerosol inhalation

Child 12–18 years 2 puffs twice daily

MOMETASONE FUROATE

Cautions see notes above

Side-effects see notes above; also pharyngitis, headache; *less commonly* palpitation

Indication and dose

Prophylaxis of asthma see also Management of Chronic Asthma, p. 170

- By inhalation of powder

Child 12–18 years 200–400 micrograms as a single dose in the evening or in 2 divided doses; dose increased to 400 micrograms twice daily if necessary

Asmanex® (Schering-Plough) ▼ (POM)

Twisthaler (= dry powder inhaler), mometasone furoate 200 micrograms/metered inhalation, net price 30-dose unit = £16.00, 60-dose unit = £24.00; 400 micrograms/metered inhalation, 30-dose unit = £22.20, 60-dose unit = £36.75. Label: 8, counselling, dose, 10, steroid card

Note The *Scottish Medicines Consortium* has advised (November 2003) that *Asmanex®* is restricted for use following failure of first-line inhaled corticosteroids

3.3 Cromoglicate and related therapy and leukotriene receptor antagonists

3.3.1 Cromoglicate and related therapy

3.3.2 Leukotriene receptor antagonists

3.3.1 Cromoglicate and related therapy

The mode of action of **sodium cromoglicate** and **nedocromil** is not completely understood; they may be of value as *prophylaxis* in asthma with an allergic basis, but the evidence for benefit of sodium cromoglicate in children is contentious. Prophylaxis with cromoglicate or nedocromil is less effective than with inhaled corticosteroids (see Management of Chronic Asthma, p. 170).

Nedocromil may be of some benefit in the prophylaxis of exercise-induced asthma.

For the use of sodium cromoglicate and nedocromil in allergic conjunctivitis see section 11.4.2; sodium cromoglicate is used also in allergic rhinitis (section 12.2.1) and allergy-related diarrhoea (section 1.5.4).

SODIUM CROMOGLICATE

(Sodium Cromoglycate)

Cautions discontinue if eosinophilic pneumonia occurs

Side-effects coughing, transient bronchospasm, and throat irritation; *very rarely* hypersensitivity reactions (including angioedema); rhinitis and headache also reported

Indication and dose

Prophylaxis of asthma (see also Management of Chronic Asthma, p. 170)

• By aerosol inhalation

Child 5–18 years 10 mg (2 puffs) 4 times daily, increased if necessary to 6–8 times daily; an additional dose may also be taken before exercise; maintenance, 5 mg (1 puff) 4 times daily

Food allergy section 1.5.4

Allergic conjunctivitis section 11.4.2

Allergic rhinitis section 12.2.1

Intal® CFC-free inhaler (Sanofi-Aventis) (POM)

Aerosol inhalation, sodium cromoglicate 5 mg/metered inhalation, net price 112-dose unit = £15.44. Label: 8, Counselling, change to CFC-free inhaler

Excipients include HFA-227 (a non-CFC propellant)

NEDOCROMIL SODIUM

Side-effects see under Sodium Cromoglicate; also headache, nausea, vomiting, dyspepsia and abdominal pain; bitter taste (masked by mint flavour)

Licensed use not licensed for use in children under 6 years

Indication and dose

Prophylaxis of asthma (but see notes above)

Counselling Regular use is necessary

• By aerosol inhalation

Child 5–18 years 4 mg (2 puffs) 4 times daily, when control achieved may be possible to reduce to twice daily

Allergic conjunctivitis section 11.4.2

Tilade CFC-free inhaler® (Sanofi-Aventis) ▼ (POM)

Aerosol inhalation, mint-flavoured, nedocromil sodium 2 mg/metered inhalation. Net price 112-dose unit = £39.94. Label: 8, counselling, change to CFC-free inhaler

Excipients include HFA-227 (a non-CFC propellant)

3.3.2 Leukotriene receptor antagonists

The leukotriene receptor antagonists, **montelukast** and **zafirlukast**, block the effects of cysteinyl leukotrienes in the airways; they can be used with an inhaled corticosteroid (see Management of Chronic Asthma, p. 170) but adequate control is not always achieved. Montelukast has not been shown to be more effective than a standard dose of inhaled corticosteroid but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis but they are less effective in children with severe asthma who are also receiving high doses of other drugs.

Churg-Strauss syndrome Churg-Strauss syndrome has occurred very rarely in association with the use of leukotriene receptor antagonists; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. The CSM has advised that prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

MONTELUKAST

Cautions interactions: Appendix 1 (leukotriene receptor antagonists)

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises avoid unless essential

Side-effects abdominal pain, thirst; hyperkinesia (in young children), headache; *very rarely* Churg-Strauss syndrome (see notes above); dry mouth, diarrhoea, dyspepsia, nausea, vomiting, hepatic disorders, palpitation, oedema, increased bleeding, hypersensitivity reactions (including anaphylaxis and skin reactions), depression, tre-

□ MONTELUKAST (continued)

mor, asthenia, dizziness, hallucinations, suicidal thoughts and behaviour, paraesthesia, hypoaesthesia, sleep disturbances, abnormal dreams, agitation, aggression, seizures, arthralgia, and myalgia also reported

Indication and dose

Prophylaxis of asthma see notes above and Management of Chronic Asthma, p. 170

- By mouth

Child 6 months–6 years 4 mg once daily in the evening

Child 6–15 years 5 mg once daily in the evening

Child 15–18 years 10 mg once daily in the evening

Symptomatic relief of seasonal allergic rhinitis in children with asthma

- By mouth

Child 15–18 years 10 mg once daily in the evening

Singulair® (MSD) (POM)

Chewable tablets, pink, cherry-flavoured, montelukast (as sodium salt) 4 mg, net price 28-tab pack = £25.69; 5 mg, 28-tab pack = £25.69. Label: 24 **Excipients** include aspartame equivalent to phenylalanine 674 micrograms/4-mg tablet and 842 micrograms/5-mg tablet (section 9.4.1)

Granules, montelukast (as sodium salt) 4 mg, net price 28-sachet pack = £25.69. Counselling, administration

Counselling Granules may be swallowed whole or mixed with cold food (but not fluid) and taken immediately

Tablets, beige, f/c, montelukast (as sodium salt) 10 mg, net price 28-tab pack = £26.97

Note The *Scottish Medicines Consortium* has advised (June 2007) that *Singulair*® chewable tablets and granules are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use, and who are not capable of using inhaled corticosteroids; *Singulair*® chewable tablets and granules should be initiated by a specialist in paediatric asthma

ZAFIRLUKAST

Cautions interactions: Appendix 1 (leukotriene receptor antagonists)

Hepatic disorders Children or their carers should be told how to recognise development of liver disorder and advised to seek medical attention if symptoms or signs such as persistent nausea, vomiting, malaise or jaundice develop

Renal impairment manufacturer advises caution in moderate to severe impairment

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Contra-indications hepatic impairment

Breast-feeding present in milk—manufacturer advises avoid

Side-effects gastro-intestinal disturbances; headache; rarely bleeding disorders, hypersensitivity

reactions including angioedema and skin reactions, arthralgia, myalgia, hepatitis, hyperbilirubinaemia, thrombocytopenia; *very rarely* Churg-Strauss syndrome (see notes above), agranulocytosis

Indication and dose

Prophylaxis of asthma see notes above and Management of Chronic Asthma, p. 170

- By mouth

Child 12–18 years 20 mg twice daily

Accolate® (AstraZeneca) (POM)

Tablets, f/c, zafirlukast 20 mg, net price 56-tab pack = £28.26. Label: 23

3.4 Antihistamines, immunotherapy, and allergic emergencies

3.4.1 Antihistamines

3.4.2 Allergen immunotherapy

3.4.3 Allergic emergencies

3.4.1 Antihistamines

Antihistamines (histamine H₁-receptor antagonists) are classified as *sedating* or *non-sedating*, according to their relative potential for CNS depression. Antihistamines differ in their duration of action, incidence of drowsiness, and antimuscarinic effects; the response to an antihistamine may vary from child to child (see Side-effects, p. 192). Either a sedating or a non-sedating antihistamine may be used to treat an acute allergic reaction; for conditions with more persistent symptoms, a non-sedating antihistamine should be used regularly.

Oral antihistamines are used in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hay fever), and may be of some value in vasomotor rhinitis; rhinorrhoea and sneezing is reduced, but antihistamines are usually less effective for nasal congestion. Antihistamines are used topically to treat allergic

reactions in the eye (section 11.4.2) and in the nose (section 12.2.1). Topical application of antihistamines to the skin is not recommended (section 13.3).

An oral antihistamine may be used to prevent urticaria, and for the treatment of acute urticarial rashes, pruritus, insect bites, and stings. Antihistamines are also used in the management of nausea and vomiting (section 4.6), of migraine (section 4.7.4.1), and the adjunctive management of anaphylaxis and angioedema (section 3.4.3).

Sedating antihistamines are occasionally useful when insomnia is associated with urticaria and pruritus (section 4.1.1). Most of the sedating antihistamines are relatively short acting, but promethazine may be effective for up to 12 hours. **Alimemazine** (trimeprazine) and **promethazine** have a more sedative effect than **chlorphenamine** (chlorpheniramine) and **cyclizine** (section 4.6). Chlorphenamine is used as an adjunct to adrenaline (epinephrine) in the emergency treatment of anaphylaxis and angioedema (section 3.4.3).

The *non-sedating* antihistamine **cetirizine** is safe and effective in children; it causes less sedation and psychomotor impairment than the sedating antihistamines. Other non-sedating antihistamines that are used in children include **desloratadine** (an active metabolite of loratadine), **fexofenadine** (an active metabolite of terfenadine), **levocetirizine** (an isomer of cetirizine), **loratadine**, and **mizolastine**. Most non-sedating antihistamines are long-acting (usually 12–24 hours). There is little evidence that desloratadine or levocetirizine confer any additional benefit—they should be reserved for children who cannot tolerate other therapies.

Cautions and contra-indications Antihistamines should be used with caution in hepatic impairment (see below) and in children with epilepsy. Most antihistamines should be avoided in acute porphyria, but some are thought to be safe (see section 9.8.2). Sedating antihistamines should not be given to children under 2 years, except on specialist advice, because the safety of such use has not been established. Sedating antihistamines have significant antimuscarinic activity—they should **not** be used in neonates and should be used with caution in children with urinary retention, glaucoma, or pyloroduodenal obstruction. **Interactions:** see Appendix 1 (antihistamines).

Hepatic impairment Sedating antihistamines should be avoided in children with severe liver disease—increased risk of coma.

Pregnancy and breast-feeding There is no evidence of teratogenicity associated with the use of antihistamines, except for hydroxyzine and loratadine where embryotoxicity has been reported with high doses in *animal* studies. However, manufacturers of some antihistamines advise avoiding use during pregnancy. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor. Significant amounts of some antihistamines are present in breast milk; although not known to be harmful, manufacturers advise avoiding use in mothers who are breast-feeding.

Side-effects Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely in children, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines (see also notes above). Side-effects that are more common with the older antihistamines include headache, psychomotor impairment, and antimuscarinic effects such as urinary retention, dry mouth, blurred vision, and gastro-intestinal disturbances. Other rare side-effects of antihistamines include hypotension, palpitation, arrhythmias, extrapyramidal effects, dizziness, confusion, depression, sleep disturbances, tremor, convulsions, hypersensitivity reactions (including bronchospasm, angioedema, anaphylaxis, rashes, and photosensitivity reactions), blood disorders, and liver dysfunction.

Non-sedating antihistamines

Skilled tasks Although drowsiness is rare, children and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

CETIRIZINE HYDROCHLORIDE

Cautions see notes above

Renal impairment use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children under 6 years except for use in children 2–6 years for treatment of seasonal allergic rhinitis

Indication and dose

Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria, atopic dermatitis

- By mouth

Child 1–2 years 250 micrograms/kg twice daily

Child 2–6 years 5 mg once daily or 2.5 mg twice daily

Child 6–18 years 10 mg once daily or 5 mg twice daily

Cetirizine (Non-proprietary)

Tablets, cetirizine hydrochloride 10 mg, net price 30-tab pack = 97p. Counselling, skilled tasks

Dental prescribing on NHS Cetirizine 10 mg tablets may be prescribed

Oral solution, cetirizine hydrochloride 5 mg/5 mL, net price 200 mL = £2.43. Counselling, skilled tasks

DESLORATADINE

Note Desloratadine is a metabolite of loratadine

Cautions see notes above

Contra-indications see notes above; also hypersensitivity to loratadine

Side-effects see notes above; rarely myalgia; very rarely hallucinations

Indication and dose

Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

- By mouth

Child 1–6 years 1.25 mg once daily

Child 6–12 years 2.5 mg once daily

Child 12–18 years 5 mg once daily

Neoclaritin® (Schering-Plough) (PoM)

Tablets, blue, f/c, desloratadine 5 mg, net price 30-tab pack = £7.04. Counselling, skilled tasks

Syrup, desloratadine 2.5 mg/5 mL, net price 100 mL (bubblegum-flavour) = £7.04. Counselling, skilled tasks

FEXOFENADINE HYDROCHLORIDE

Note Fexofenadine is a metabolite of terfenadine

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Indication and dose

Symptomatic relief of seasonal allergic rhinitis

- By mouth

Child 6–12 years 30 mg twice daily

Child 12–18 years 120 mg once daily

Symptomatic relief of chronic idiopathic urticaria

- By mouth

Child 12–18 years 180 mg once daily

Fexofenadine (Non-proprietary) (PoM)

Tablets, f/c, fexofenadine hydrochloride 120 mg, net price 30-tab pack = £5.92; 180 mg, 30-tab pack = £7.49. Label: 5, counselling, skilled tasks

Telfast® (Aventis Pharma) (PoM)

Tablets, f/c, peach, fexofenadine hydrochloride 30 mg, net price 60-tab pack = £5.68; 120 mg, 30-tab pack = £6.23; 180 mg, 30-tab pack = £7.89. Label: 5, counselling, skilled tasks

LEVOCETIRIZINE HYDROCHLORIDE

Note Levocetirizine is an isomer of cetirizine

Cautions see notes above

Renal impairment estimated glomerular filtration rate 30–50 mL/minute/1.73 m², reduce dose frequency to alternate days; estimated glomerular filtration rate 10–30 mL/minute/1.73 m², reduce dose frequency to every 3 days; estimated glomerular filtration rate less than 10 mL/minute/1.73 m², avoid

Contra-indications see notes above

Side-effects see notes above; very rarely weight gain

Licensed use tablets not licensed for use in children under 6 years

Indication and dose

Symptomatic relief of allergy such as hay fever, urticaria

- By mouth

Child 2–6 years 1.25 mg twice daily

Child 6–18 years 5 mg once daily

□ LEVOCETIRIZINE HYDROCHLORIDE (continued)

Xyzal[®] (UCB Pharma) (POM)

Tablets, f/c, levocetirizine hydrochloride 5 mg, net price 30-tab pack = £5.20. Counselling, skilled tasks

Oral solution, levocetirizine hydrochloride 2.5 mg/5 mL, net price 200 mL = £6.00. Counselling, skilled tasks

LORATADINE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Indication and dose

Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

- By mouth

Child 2–6 years 5 mg once daily

Child 6–18 years 10 mg once daily

Loratadine (Non-proprietary)

Tablets, loratadine 10 mg, net price 30-tab pack = £1.24. Counselling, skilled tasks

Dental prescribing on NHS Loratadine 10 mg tablets may be prescribed

Syrup, loratadine 5 mg/5 mL, net price 100 mL = £5.16. Counselling, skilled tasks

MIZOLASTINE

Cautions see notes above

Contra-indications see notes above; also susceptibility to QT-interval prolongation (including cardiac disease and hypokalaemia)

Hepatic impairment manufacturer recommends avoid in significant hepatic impairment

Side-effects see notes above; weight gain; anxiety, asthenia; *less commonly* arthralgia and myalgia

Indication and dose

Symptomatic relief of allergy such as hay fever, urticaria

- By mouth

Child 12–18 years 10 mg once daily

Mizollen[®] (Sanofi-Aventis) (POM)

Tablets, m/r, f/c, scored, mizolastine 10 mg, net price 30-tab pack = £5.77. Label: 25, counselling, skilled tasks

Sedating antihistamines

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

ALIMEMAZINE TARTRATE

(Trimeprazine tartrate)

Cautions see notes above

Contra-indications see notes above

Renal impairment avoid

Side-effects see notes above

Licensed use not licensed for use in children under 2 years

Indication and dose

Urticaria, pruritus

- By mouth

Child 6 months–2 years 250 micrograms/kg (max. 2.5 mg) 3–4 times daily—specialist use only

Child 2–5 years 2.5 mg 3–4 times daily

Child 5–12 years 5 mg 3–4 times daily

Child 12–18 years 10 mg 2–3 times daily, in severe cases up to max. 100 mg daily

Premedication section 15.1.4

- By mouth

Child 2–7 years up to max. 2 mg/kg 1–2 hours before operation

Vallergan[®] (Sanofi-Aventis) (POM)

Tablets, blue, f/c, alimemazine tartrate 10 mg, net price 28-tab pack = £3.89. Label: 2

Syrup, straw-coloured, alimemazine tartrate 7.5 mg/5 mL, net price 100 mL = £4.44. Label: 2

Syrup forte, alimemazine tartrate 30 mg/5 mL, net price 100 mL = £6.86. Label: 2

CHLORPHENAMINE MALEATE

(Chlorpheniramine maleate)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also exfoliative dermatitis and tinnitus reported; injections may cause transient hypotension or CNS stimulation and may be irritant

◊ CHLORPHENAMINE MALEATE (*continued*)

Licensed use *syrup* not licensed for use in children under 1 year; *tablets* not licensed for use in children under 6 years; *injection* not licensed for use in neonates

Indication and dose

Symptomatic relief of allergy such as hay fever, urticaria

• By mouth

Child 1 month–2 years 1 mg twice daily

Child 2–6 years 1 mg every 4–6 hours, max. 6 mg daily

Child 6–12 years 2 mg every 4–6 hours, max. 12 mg daily

Child 12–18 years 4 mg every 4–6 hours, max. 24 mg daily

Emergency treatment of anaphylactic reactions, symptomatic relief of allergy

• By intramuscular or intravenous injection

Child under 6 months 250 micrograms/kg (max. 2.5 mg), repeated if required up to 4 times in 24 hours

Child 6 months–6 years 2.5 mg, repeated if required up to 4 times in 24 hours

Child 6–12 years 5 mg, repeated if required up to 4 times in 24 hours

Child 12–18 years 10 mg, repeated if required up to 4 times in 24 hours

Administration for *intravenous injection*, give over 1 minute; if small dose required, dilute with Sodium Chloride 0.9%

Chlorphenamine (Non-proprietary)

Tablets, chlorphenamine maleate 4 mg, net price 28 = £1.12. Label: 2

Dental prescribing on NHS Chlorphenamine tablets may be prescribed

Oral solution, chlorphenamine maleate 2 mg/5 mL, net price 150 mL = £2.25. Label: 2

Dental prescribing on NHS Chlorphenamine oral solution may be prescribed

Injection (PoM¹), chlorphenamine maleate 10 mg/mL, net price 1-mL amp = £1.62

1. (PoM) restriction does not apply where administration is for saving life in emergency

Piriton® (GSK Consumer Healthcare)

Tablets, yellow, scored, chlorphenamine maleate 4 mg, net price 28 = £1.62. Label: 2

Syrup, chlorphenamine maleate 2 mg/5 mL, net price 150 mL = £2.39. Label: 2

HYDROXYZINE HYDROCHLORIDE

Cautions see notes above

Renal impairment use half normal dose

Contra-indications see notes above

Side-effects see notes above

Licensed use *Ucerax*® syrup not licensed for use in children under 1 year

Indication and dose

Pruritus

• By mouth

Child 6 months–6 years initially 5–15 mg at night, increased if necessary to 50 mg daily in 3–4 divided doses

Child 6–12 years initially 15–25 mg at night, increased if necessary to 50–100 mg daily in 3–4 divided doses

Child 12–18 years initially 25 mg at night, increased if necessary to 100 mg in 3–4 divided doses

Atarax® (Alliance) (PoM)

Tablets, both s/c, hydroxyzine hydrochloride 10 mg (orange), net price 84-tab pack = £1.82; 25 mg (green), 28-tab pack = £1.22. Label: 2

Ucerax® (UCB Pharma) (PoM)

Tablets (NHS), f/c, scored, hydroxyzine hydrochloride 25 mg, net price 25-tab pack = £1.22. Label: 2

Syrup, hydroxyzine hydrochloride 10 mg/5 mL. Net price 200-mL pack = £1.78. Label: 2

KETOTIFEN

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also irritability, nervousness; *less commonly* cystitis; *rarely* weight gain; *very rarely* Stevens-Johnson syndrome

Indication and dose

Symptomatic relief of allergy such as allergic rhinitis

• By mouth

Child 3–18 years 1 mg twice daily

Zaditen® (Novartis) (PoM)

Tablets, scored, ketotifen (as hydrogen fumarate) 1 mg, net price 60-tab pack = £10.75. Label: 2, 21

Elixir, ketotifen (as hydrogen fumarate), 1 mg/5 mL, net price 300 mL (strawberry-flavoured) = £12.73. Label: 2, 21

PROMETHAZINE HYDROCHLORIDE**Cautions** see notes above**Contra-indications** see notes above; severe coronary artery disease**Side-effects** see notes above; also restlessness**Indication and dose****Symptomatic relief of allergy such as hay fever, insomnia associated with urticaria and pruritus**• **By mouth****Child 2–5 years** 5 mg twice daily or 5–15 mg at night**Child 5–10 years** 5–10 mg twice daily or 10–25 mg at night**Child 10–18 years** 10–20 mg 2–3 times daily or 25 mg at night increased to 25 mg twice daily if necessary**Sedation** section 4.1.1**Nausea and vomiting** section 4.6**Phenergan**[®] (Sanofi-Aventis)

Dental prescribing on NHS May be prescribed as Promethazine Hydrochloride Tablets 10 mg or 25 mg**Elixir**, golden, promethazine hydrochloride 5 mg/5 mL. Net price 100 mL = £1.93. Label: 2**Dental prescribing on NHS** May be prescribed as Promethazine Hydrochloride Oral Solution 5 mg/5 mL**3.4.2 Allergen immunotherapy**

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can improve symptoms of asthma and allergic rhino-conjunctivitis in children. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in children with hypersensitivity to wasp and bee stings. Children requiring immunotherapy must be referred to a hospital specialist for accurate allergy diagnosis, assessment, and treatment.

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- hypersensitivity to wasp and bee venoms.

Desensitising vaccines should generally be avoided or used with particular care in children with asthma.

Desensitising vaccines should be avoided in pregnant women, in children under 5 years, and in those taking beta-blockers (adrenaline will be ineffective if a hypersensitivity reaction occurs), or ACE inhibitors (risk of severe anaphylactoid reactions).

Hypersensitivity reactions to immunotherapy (especially to wasp and bee venom extracts) can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore the child needs to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), **even when mild**, the child should be observed until these have **resolved completely**.

For details of the management of anaphylactic shock, see section 3.4.3.

Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

BEE AND WASP ALLERGEN EXTRACTS**Cautions** see notes above and consult product literature**CSM advice** The CSM has advised that facilities for cardiopulmonary resuscitation must be immediately available and children monitored closely for 1 hour after each injection**Contra-indications** see notes above and consult product literature**Side-effects** consult product literature**Indication and dose****Hypersensitivity to wasp or bee venom** (see notes above)

- **By subcutaneous injection**
Consult product literature

▢ BEE AND WASP ALLERGEN EXTRACTS (continued)

Pharmalgen® (ALK-Abelló) (POM)

Bee venom extract (*Apis mellifera*) or wasp venom extract (*Vespula* spp.). Net price initial treatment set

= £59.77 (bee), £73.28 (wasp); maintenance treatment set = £69.54 (bee), £89.45 (wasp)

GRASS AND TREE POLLEN EXTRACTS

Cautions see notes above and consult product literature

CSM advice The CSM has advised that facilities for cardiopulmonary resuscitation must be immediately available and children must be monitored closely for 1 hour after each injection

Contra-indications see notes above and consult product literature

Side-effects consult product literature

Indication and dose

Treatment of seasonal allergic hay fever due to grass or tree pollen (see notes above)

See under preparations, below

Pollinex® (Allergy) (POM)

Grasses and rye or tree pollen extract, net price initial treatment set (3 vials) and extension course treatment (1 vial) = £320.00

Dose

- By subcutaneous injection
- Consult product literature

▲ Grass pollen extract

Grazax® (ALK-Abelló) (POM)

Oral lyophilisates (= freeze-dried tablets), grass pollen extract 75 000 units, net price 30-tab pack = £67.50. Counselling, administration

Dose

- By mouth

Child 5–18 years 1 tablet daily; start treatment at least 4 months before start of pollen season and continue for up to 3 years

Counselling Tablets should be placed under the tongue and allowed to dissolve

Omalizumab

Omalizumab is a monoclonal antibody that binds to immunoglobulin E (IgE). It is licensed for use as additional therapy in children over 12 years with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high-dose inhaled corticosteroid together with a long-acting beta₂ agonist. Omalizumab should be initiated by physicians experienced in the treatment of severe persistent asthma.

Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction or withdrawal of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy. Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

For details on the management of anaphylactic shock, see section 3.4.3.

NICE guidance

Omalizumab for severe persistent allergic asthma (November 2007)

Omalizumab is recommended as additional therapy for the prophylaxis of severe persistent allergic asthma in children over 12 years, who cannot be controlled adequately with high-dose inhaled corticosteroids and long-acting beta₂ agonists in addition to leukotriene receptor antagonists, theophylline, oral corticosteroids, oral beta₂ agonists, and smoking cessation where clinically appropriate. The following conditions apply:

- confirmation of IgE-mediated allergy to a perennial allergen by clinical history and allergy skin testing;
- either 2 or more severe exacerbations of asthma requiring hospital admission within the previous year, or 3 or more severe exacerbations of asthma within the previous year, at least one of which required hospital admission, and a further 2 which required treatment or monitoring in excess of the patient's usual regimen, in an accident and emergency unit.

Omalizumab should be initiated and monitored by a physician experienced in both allergy and respiratory medicine in a specialist centre, and discontinued at 16 weeks in patients who have not shown an adequate response to therapy.

OMALIZUMAB

Cautions autoimmune disease; susceptibility to helminth infections—discontinue if infection does not respond to anthelmintic

Hepatic impairment manufacturer advises caution—no information available

Renal impairment manufacturer advises caution—no information available

Pregnancy manufacturer advises avoid unless essential; no evidence of teratogenicity in *animal* studies

Contra-indications

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects headache; injection-site reactions; *less commonly* nausea, diarrhoea, dyspepsia, flushing, fatigue, dizziness, drowsiness, paraesthesia, weight gain, influenza-like symptoms, photosensitivity, hypersensitivity reactions

(including hypotension, bronchospasm, laryngoedema, rash, pruritus, serum sickness, and anaphylaxis); Churg-Strauss syndrome (see notes above), thrombocytopenia, arthralgia, myalgia, and alopecia also reported

Indication and dose

Prophylaxis of severe persistent allergic asthma (see notes above)

• **By subcutaneous injection**

Child 12–18 years according to immunoglobulin E concentration and body-weight, consult product literature

Xolair[®] (Novartis) ▼ [Pm]

Injection, powder for reconstitution, omalizumab, net price 150-mg vial = £256.15 (with solvent)

Excipients include sucrose 108 mg/vial

3.4.3 Allergic emergencies

Adrenaline (epinephrine) provides physiological reversal of the immediate symptoms (such as laryngeal oedema, bronchospasm, and hypotension) associated with hypersensitivity reactions such as *anaphylaxis* and *angioedema*.

Anaphylaxis

Anaphylactic shock requires prompt treatment of *laryngeal oedema*, *bronchospasm*, and *hypotension*. Atopic individuals are particularly susceptible. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow's milk protein, peanuts, and tree nuts may also precipitate anaphylaxis. Medicinal products particularly associated with anaphylaxis include blood products, vaccines, allergen immunotherapy preparations, antibiotics, aspirin and other NSAIDs, heparin, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available when giving injections associated with special risk. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergenic fats or oils.

Treatment of anaphylaxis

First-line treatment includes:

- securing the airway, restoration of blood pressure (laying the child flat and raising the legs, or in the recovery position if unconscious or nauseous and at risk of vomiting);
- administering **adrenaline** (epinephrine) by **intramuscular** injection (for doses see Intramuscular Adrenaline, p. 199); the dose should be repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function [**important**: possible need for *intravenous route using dilute solution* (Adrenaline 1 in 10 000), see Intravenous Adrenaline p. 199];
- administering high-flow **oxygen** (section 3.6) and **intravenous fluids** (section 9.2.2);
- administering an antihistamine, such as **chlorphenamine** (chlorpheniramine), by slow intravenous injection or intramuscular injection (section 3.4.1) as adjunctive treatment given after adrenaline injection and the antihistamine continued orally for 24 to 48 hours according to clinical response to prevent relapse.

Continuing respiratory deterioration requires further treatment with **bronchodilators** including inhaled or intravenous salbutamol (see p. 174), inhaled ipratropium (see p. 178), intravenous aminophylline (see p. 180), or intravenous magnesium sulphate [unlicensed indication] (see Management of Acute Asthma,

p. 168). In addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

An intravenous corticosteroid (section 6.3.2) such as **hydrocortisone** (as sodium succinate) is of secondary value in the initial management of anaphylactic shock because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected children and continued for 24–48 hours according to clinical response.

When a child is so ill that there is doubt as to the adequacy of the circulation, the initial injection of adrenaline may need to be given as a *dilute solution by the intravenous route*, or by the intraosseous route if venous access is difficult—for details of cautions, dose and strength, see under Intravenous Adrenaline (Epinephrine), below.

Some children with severe allergy to insect stings or foods are encouraged to carry prefilled adrenaline syringes for *self-administration* during periods of risk.

Children who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis; avoidance of the allergen is the principal treatment.

Intramuscular adrenaline (epinephrine)

The *intramuscular route* is the *first choice route* for the administration of adrenaline in the management of anaphylactic shock. Adrenaline has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site. The intravenous route should be reserved for extreme emergency when there is doubt about the adequacy of the circulation; for details of cautions, dose and strength see Intravenous Adrenaline (Epinephrine), below.

Carers of children or the child with severe allergy should ideally be instructed in the self-administration of adrenaline by intramuscular injection (for details see Self-administration of Adrenaline (Epinephrine), p. 200).

Prompt injection of adrenaline is of paramount importance. The following adrenaline doses are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

Dose of intramuscular injection of adrenaline (epinephrine) for anaphylactic shock

Age range	Dose	Volume of adrenaline 1 in 1000 (1 mg/mL)
Under 6 years	150 micrograms	0.15 mL ¹
6–12 years	300 micrograms	0.3 mL
12–18 years	500 micrograms	0.5 mL ²
These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse and respiratory function.		

1. Use suitable syringe for measuring small volume
2. 300 micrograms (0.3 mL) if child is small or prepubertal

Intravenous adrenaline (epinephrine)

Intravenous adrenaline should be given only by those experienced in its use, in a setting where patients can be carefully monitored; it should be given to children only when intravenous access is already available.

Where the child is severely ill and there is real doubt about adequacy of the circulation and absorption from the intramuscular injection site, adrenaline may be given by *slow intravenous injection*. Children may respond to as little as 1 microgram/kg (0.01 mL/kg) of the dilute 1 in 10 000 adrenaline injection by *slow intravenous injection* over several minutes, repeated according to response. A single dose of adrenaline by intravenous injection should not exceed 50 micrograms; if multiple doses are required consider giving adrenaline by *slow intravenous infusion*. Great vigilance is needed to ensure that the *correct strength* of

adrenaline injection is used; anaphylactic shock kits need to make a *very clear distinction* between the 1 in 10 000 strength and the 1 in 1000 strength. It is also important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

For reference to the use of the intravenous route for *acute hypotension*, see section 2.7.2.

Self-administration of adrenaline (epinephrine)

Children at considerable risk of anaphylaxis need to carry (or have available) adrenaline at all times and the child, or child's carers, need to be *instructed in advance* how to inject it. Packs for self-administration need to be **clearly labelled with instructions** on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary). It is important to ensure that an adequate supply is provided to treat symptoms until medical assistance is available.

Adrenaline for administration by intramuscular injection is available in 'auto-injectors', pre-assembled syringes (e.g. *Anapen*[®] or *EpiPen*[®]) fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available). A syringe delivering 300 micrograms of adrenaline is recommended for a child over 30 kg. A syringe delivering 150 micrograms of adrenaline is recommended for a child 15–30 kg, but on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children.

ADRENALINE/EPINEPHRINE

Cautions heart disease, hypertension, arrhythmias, cerebrovascular disease, phaeochromocytoma; diabetes mellitus, hyperthyroidism; susceptibility to angle-closure glaucoma

Interactions Severe anaphylaxis in children on non-cardioselective beta-blockers may not respond to adrenaline injection calling for intravenous injection of salbutamol (see section 3.1.1.1); furthermore, adrenaline may cause severe hypertension and bradycardia in those receiving non-cardioselective beta-blockers. Other **interactions**, see Appendix 1 (sympathomimetics).

Side-effects nausea, vomiting; tachycardia, arrhythmias, palpitation, cold extremities, hypertension (risk of cerebral haemorrhage); dyspnoea, pulmonary oedema (on excessive dosage or extreme sensitivity); anxiety, tremor, restlessness, headache, weakness, dizziness; hyperglycaemia; urinary retention; sweating; tissue necrosis at injection site

Indication and dose

Emergency treatment of acute anaphylaxis, angioedema

- By intramuscular injection (preferably midpoint in anterolateral thigh) of 1 in 1000 (1 mg/mL) solution
See notes and table above

Acute anaphylaxis when there is doubt as to the adequacy of the circulation

- By slow intravenous injection of 1 in 10 000 (100 micrograms/mL) solution (extreme caution—specialist use only)
See notes above

Safe Practice Intravenous route should be used with **extreme care** by specialists only, see notes above

Croup (section 3.1)

- By inhalation of nebulised solution of adrenaline 1 in 1000 (1 mg/mL)

Child 1 month–12 years 400 micrograms/kg (max. 5 mg), repeated after 30 minutes if necessary

Administration For nebulisation, dilute adrenaline 1 in 1000 solution with sterile sodium chloride 0.9% solution

Acute hypotension, low cardiac output section 2.7.2

Cardiopulmonary resuscitation section 2.7.3

▲ Intramuscular or subcutaneous

1 Adrenaline/Epinephrine 1 in 1000 (Non-proprietary)

(POM)

Injection, adrenaline (as acid tartrate) 1 mg/mL, net price 0.5-mL amp = 49p; 1-mL amp = 56p
Excipients include sulphites

1 Minijet[®] Adrenaline 1 in 1000 (UCB Pharma) (POM)

Injection, adrenaline (as hydrochloride) 1 in 1000 (1 mg/mL). Net price 1 mL (with 25 gauge × 0.25 inch needle for subcutaneous injection) = £9.81, 1 mL (with 21 gauge × 1.5 inch needle for intramuscular injection) = £5.78 (both disposable syringes)

Excipients include sulphites

1. (POM) restriction does not apply to adrenaline injection 1 mg/mL where administration is for saving life in emergency

ADRENALINE/EPINEPHRINE (continued)

Intravenous

Extreme caution, see notes above

Adrenaline/Epinephrine 1 in 10 000, Dilute (Non-proprietary) ^(POM)

Injection, adrenaline (as acid tartrate) 100 micrograms/mL, 10-mL amp, 1-mL and 10-mL prefilled syringe

Excipients include sulphites

Minijet® Adrenaline 1 in 10 000 (UCB Pharma) ^(POM)

Injection, adrenaline (as hydrochloride) 1 in 10 000 (100 micrograms/mL), net price 3-mL prefilled syringe = £5.70; 10-mL prefilled syringe = £5.30

Excipients include sulphites

Intramuscular injection for self-administration

Anapen® (Lincoln Medical) ^(POM)

¹Anapen® 0.3 mg solution for injection (delivering a single dose of adrenaline 300 micrograms), adrenaline 1 mg/mL (1 in 1000), net price 1.05-mL auto-injector device = £30.67

Excipients include sulphites

Note 0.75 mL of the solution remains in the auto-injector device after use

Dose

Acute anaphylaxis

- By intramuscular injection

Child over 30 kg 300 micrograms repeated after 10–15 minutes as necessary

Anapen® Junior 0.15 mg solution for injection (delivering a single dose of adrenaline 150 micrograms), adrenaline 500 micrograms/mL (1 in 2000), net price 1.05-mL auto-injector device = £30.67

Excipients include sulphites

Note 0.75 mL of the solution remains in the auto-injector device after use

Dose

Acute anaphylaxis

- By intramuscular injection

Child 15–30 kg 150 micrograms (but on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children) repeated after 10–15 minutes as necessary

EpiPen® (ALK-Abelló) ^(POM)

¹EpiPen® Auto-injector 0.3 mg (delivering a single dose of adrenaline 300 micrograms), adrenaline 1 mg/mL (1 in 1000), net price 2-mL auto-injector = £28.05

Excipients include sulphites

Note 1.7 mL of the solution remains in the Auto-injector after use

Dose

Acute anaphylaxis

- By intramuscular injection

Child over 30 kg 300 micrograms repeated after 5–15 minutes as necessary

Epipen® Jr Auto-injector 0.15 mg (delivering a single dose of adrenaline 150 micrograms), adrenaline 500 micrograms/mL (1 in 2000), net price 2-mL auto-injector = £28.05

Excipients include sulphites

Note 1.7 mL of the solution remains in the Auto-injector after use

Dose

Acute anaphylaxis

- By intramuscular injection

Child 15–30 kg 150 micrograms (but on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children) repeated after 5–15 minutes as necessary

Angioedema

Angioedema is dangerous if laryngeal oedema is present. In this circumstance adrenaline (epinephrine) injection and oxygen should be given as described under Anaphylaxis (see above); antihistamines and corticosteroids should also be given (see again above). Tracheal intubation may be necessary. In some children with laryngeal oedema, adrenaline 1 in 1000 (1 mg/mL) solution may be given by nebuliser. However, nebulised adrenaline cannot be relied upon for a systemic effect—intramuscular adrenaline should be used.

Hereditary angioedema The administration of C₁ esterase inhibitor (in fresh frozen plasma or in partially purified form) may terminate acute attacks of hereditary angioedema, but is not practical for long-term prophylaxis. **Tranexamic acid** (section 2.11) is used for short-term or long-term prophylaxis of hereditary angioedema; short-term prophylaxis is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards. **Danazol** [unlicensed indication, see BNF section 6.7.2] is best avoided in children because of its androgenic effects but it can be used for short-term prophylaxis of hereditary angioedema.

1. ^(POM) restriction does not apply to adrenaline injection 1 mg/mL where administration is for saving life in emergency

3.5 Respiratory stimulants and pulmonary surfactants

3.5.1 Respiratory stimulants

3.5.1 Respiratory stimulants

Respiratory stimulants (analeptic drugs), such as caffeine and doxapram, should only be given under **expert supervision** in hospital; it is important to rule out any underlying disorder, such as seizures, hypoglycaemia, or infection, causing respiratory exhaustion before starting treatment with a respiratory stimulant.

Caffeine (as caffeine base) is licensed for the treatment of idiopathic apnoea in preterm neonates; it is used in preference to theophylline. Caffeine can also be used to improve trigger ventilation, or assist extubation in ventilated infants. Caffeine has fewer adverse effects and a longer half-life than theophylline in neonates. It is well absorbed when given orally; intravenous treatment is rarely necessary. Plasma-caffeine concentration should be measured if the child has previously been treated with theophylline. The therapeutic range for plasma-caffeine concentration is usually 10–20 mg/litre (50–100 micromol/litre), but a concentration of 25–35 mg/litre (130–180 micromol/litre) may be required.

Doxapram may be given by continuous intravenous infusion or by mouth for preterm neonates and infants who continue to have troublesome apnoea despite treatment with caffeine. When given by continuous intravenous infusion, blood pressure monitoring and frequent measurement of arterial blood gas and pH are necessary to ensure correct dosage.

CAFFEINE

Cautions gastro-oesophageal reflux; cardiovascular disease; monitor plasma-caffeine concentration (see notes above); monitor closely for 1 week after stopping treatment

Side-effects hypertension, tachycardia; irritability, restlessness; hypoglycaemia, hyperglycaemia; fluid and electrolyte imbalance

Licensed use not licensed for use as an adjunct to extubation in pre-term neonates

Indication and dose

Neonatal apnoea, adjunct to extubation in pre-term neonates

• By mouth

Neonate initially 10 mg/kg, then 2.5–5 mg/kg once daily starting 24 hours after initial dose (some neonates may require 10 mg/kg/day)

• By intravenous infusion

Neonate initially 10 mg/kg over 30 minutes, then 2.5–5 mg/kg over 10 minutes once daily starting 24 hours after initial dose (some neonates may require 10 mg/kg/day)

Note Dose expressed as caffeine base

Safe practice When prescribing, always state dose in terms of caffeine base

Caffeine base 1 mg = caffeine *citrate* 2 mg

Caffeine (Non-proprietary) ^(POM)

Injection, caffeine 5 mg/mL, net price 1-mL amp = £4.44

Electrolytes Na⁺ < 0.5 mmol/amp

▲ Caffeine citrate preparations

Caffeine citrate oral liquid available from 'special-order' manufacturers or specialist importing companies, see p. 943

DOXAPRAM HYDROCHLORIDE

Cautions impaired cardiac reserve; risk of QT interval prolongation; **interactions:** Appendix 1 (doxapram)

Contra-indications severe hypertension, thyrotoxicosis, epilepsy, physical obstruction of respiratory tract

Side-effects perineal warmth, dizziness, sweating, moderate increase in blood pressure and heart rate; hyperexcitability; high doses may cause convulsions; oral dose may cause slowed gastric emptying

Licensed use not licensed for use in children

Indication and dose

Neonatal apnoea (see notes above)

• By intravenous infusion

Neonate initially 2.5 mg/kg over 5–10 minutes, then by *continuous intravenous infusion* 300 microgram/kg/hour adjusted according to response, up to max. 1.5 mg/kg/hour

• By mouth (after initial intravenous dose)

Neonate 6 mg/kg 4 times daily

◊ DOXAPRAM HYDROCHLORIDE (continued)

Administration for intravenous infusion, dilute injection solution (20 mg/mL) to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%

For administration by mouth, dilute doxapram injection solution with Glucose 5% if necessary

Dopram[®] (Anpharm) (POM)

Injection, doxapram hydrochloride 20 mg/mL. Net price 5-mL amp = £3.00

Intravenous infusion, doxapram hydrochloride 2 mg/mL in glucose 5%. Net price 500-mL bottle = £21.33

3.5.2 Pulmonary surfactants

Pulmonary surfactants derived from animal lungs, **beractant** and **poractant alfa** are used to prevent and treat respiratory distress syndrome (hyaline membrane disease) in preterm neonates. Prophylactic use of a pulmonary surfactant may reduce the need for mechanical ventilation and is more effective than 'rescue treatment' in preterm neonates of 29 weeks or less post-menstrual age.

Pulmonary surfactants may also be of benefit in neonates with meconium aspiration syndrome or intrapartum streptococcal infection.

Pulmonary immaturity with surfactant deficit is the commonest reason for respiratory failure in the neonate, especially in those of less than 30 weeks post-menstrual age. Betamethasone (section 6.3.2) given to the mother (at least 12 hours but preferably 48 hours) before delivery substantially enhances pulmonary maturity in the neonate.

Cautions Continuous monitoring is required to avoid hyperoxaemia caused by rapid improvement in arterial oxygen concentration.

Side-effects Pulmonary haemorrhage has been rarely associated with pulmonary surfactants, especially in more preterm neonates. Obstruction of the endotracheal tube by mucous secretions has also been reported.

BERACTANT

Cautions see notes above

Side-effects see notes above

Licensed use licensed for use in respiratory distress syndrome in newborn premature infants, birth-weight over 700 g, and as prophylaxis in neonates less than 32 weeks post-menstrual age

Indication and dose

Treatment of respiratory distress syndrome in preterm neonate; prophylaxis of respiratory distress syndrome in preterm neonate

- By endotracheal tube

Neonate phospholipid 100 mg/kg equivalent to a volume of 4 mL/kg, preferably within 8 hours of birth; may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses

Survanta[®] (Abbott) (POM)

Suspension, beractant (bovine lung extract) providing phospholipid 25 mg/mL, with lipids and proteins, net price 8-mL vial = £306.43

PORACTANT ALFA

Cautions see notes above

Side-effects see notes above

Licensed use licensed for use in respiratory distress syndrome in newborn premature infants, birth-weight over 700 g, and as prophylaxis in neonates 24–32 weeks post-menstrual age

Indication and dose

Treatment of respiratory distress syndrome or hyaline membrane disease in preterm neonate; prophylaxis of respiratory distress syndrome in preterm neonate

- By endotracheal tube

Neonate treatment, 100–200 mg/kg; further doses of 100 mg/kg may be repeated 12 hours

later and after further 12 hours if still intubated; max. total dose 300–400 mg/kg; *prophylaxis*, 100–200 mg/kg soon after birth (preferably within 15 minutes); further doses of 100 mg/kg may be repeated 6–12 hours later and after further 12 hours if still intubated; max. total dose 300–400 mg/kg

Curosor[®] (Chiesi) (POM)

Suspension, poractant alfa (porcine lung phospholipid fraction) 80 mg/mL, net price 1.5-mL vial = £298.74; 3-mL vial = £580.64

3.6 Oxygen

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; administration of an inappropriate concentration of oxygen may have serious or even fatal consequences. High concentrations of oxygen can cause pulmonary epithelial damage (bronchopulmonary dysplasia), convulsions, and retinal damage, especially in preterm neonates.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation. In most acutely ill children with an expected or known normal or low arterial carbon dioxide ($P_a\text{CO}_2$), oxygen saturation should be maintained above 92%; some clinicians may aim for a target of 94–98%. In some clinical situations, such as carbon monoxide poisoning, (see also Emergency Treatment of Poisoning, p. 46), it is more appropriate to aim for the highest possible oxygen saturation until the child is stable. Hypercapnic respiratory failure is rare in children; in those children at risk, a lower oxygen saturation target of 88–92% is indicated, see below.

High concentration oxygen therapy, with concentrations of up to 60%, is safe in uncomplicated cases of conditions such as pneumonia, pulmonary embolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions, low arterial oxygen ($P_a\text{O}_2$) is usually associated with low or normal arterial carbon dioxide ($P_a\text{CO}_2$) and there is little risk of hypoventilation and carbon dioxide retention.

In severe acute asthma, the arterial carbon dioxide ($P_a\text{CO}_2$) is usually subnormal but as asthma deteriorates it may rise steeply. These patients usually require a high concentration (40–60%) of oxygen and if the arterial carbon dioxide ($P_a\text{CO}_2$) remains high despite treatment, intermittent positive pressure ventilation needs to be considered urgently. Where facilities for blood gas measurements are not immediately available, for example while transferring the patient to hospital, 35% to 50% oxygen delivered through a conventional mask is recommended.

For neonates and infants with breathing difficulties, *high concentration oxygen therapy* is usually given in an incubator or by nasal cannula if the concentration of oxygen required is less than 50%; a humidified headbox must be used for concentration of oxygen greater than 60%.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for children at risk of hypercapnic respiratory failure, which is more likely in children with:

- advanced cystic fibrosis;
- advanced non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target concentration of 88–92%. The aim is to provide the child with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis.

Domiciliary oxygen Oxygen should only be prescribed for use in the home after careful evaluation in hospital by a respiratory care specialist. Children and their carers should be advised of the risks of continuing to smoke when receiving oxygen, including the risk of fire. Smoking cessation therapy (section 4.10) should be tried before home oxygen prescription.

Long-term oxygen therapy

The aim of long-term oxygen therapy is to maintain oxygen saturation of at least 92%. Children (especially those with chronic neonatal lung disease) often require

supplemental oxygen, either for 24-hours a day or during periods of sleep; many children are eventually weaned off long-term oxygen therapy as their condition improves.

Long-term oxygen therapy should be considered for children with conditions such as:

- bronchopulmonary dysplasia (chronic neonatal lung disease);
- congenital heart disease with pulmonary hypertension;
- pulmonary hypertension secondary to pulmonary disease;
- interstitial lung disease and obliterative bronchiolitis;
- cystic fibrosis;
- obstructive sleep apnoea syndrome;
- neuromuscular or skeletal disease requiring non-invasive ventilation;
- pulmonary malignancy or other terminal disease with disabling dyspnoea.

Increased respiratory depression is seldom a problem in children with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; children and their carers should be warned to call for medical help if drowsiness or confusion occurs.

Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness.

Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for children on long-term oxygen therapy who need to be away from home on a regular basis.

Oxygen therapy equipment

Under the NHS oxygen may be supplied as **oxygen cylinders**. Oxygen flow can be adjusted by means of an oxygen flow meter. Oxygen delivered from a cylinder should be passed through a humidifier if used for long periods.

Oxygen concentrators are more economical for children who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis (see below). A concentrator is recommended for a child who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a 'Y' connection.

A nasal cannula is usually preferred to a face mask for long-term oxygen therapy from an oxygen concentrator. Nasal cannulas can, however, cause dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the child to talk, eat, and drink, but the concentration is not controlled and the method may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the child is underventilating.

Arrangements for supplying oxygen

The following services may be ordered in England and Wales:

- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The supplier will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the patient's consent to pass on the patient's details to the supplier and the fire brigade. The supplier will contact the patient to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the patient to use the equipment.

The clinician should send order forms to the supplier by facsimile (see below); a copy of the HOOF should be sent to the Primary Care Trust or Local Health Board. The supplier will continue to provide the service until a revised order is received, or until notified that the patient no longer requires the home oxygen service.

HOOF and further instructions are available at www.bprs.co.uk/oxygen.html.

Eastern England	BOC Medical
South West	to order:
	Tel: 0800 136 603
	Fax: 0800 169 9989

North East	Air Liquide
South East London	to order:
Kent, Surrey, and Sussex	Tel: 0500 823 773
South West London	Fax: 0800 781 4610
Thames Valley, Hampshire, and Isle of Wight	

North West	Air Products
Yorkshire and Humberside	to order:
East Midlands	Tel: 0800 373 580
West Midlands	Fax: 0800 214 709
North London	
Wales	

In **Scotland**, refer the child for assessment by a paediatric respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. In **Northern Ireland** oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. In **Scotland** and **North-eastern Ireland**, prescriptions for oxygen cylinders and accessories can be dispensed by pharmacies contracted to provide domiciliary oxygen services.

3.7 Mucolytics

Mucolytics, such as **carbocisteine** and **mecysteine**, are used to facilitate mucociliary clearance and expectoration by reducing sputum viscosity but evidence of efficacy is limited.

Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA); it is used to reduce sputum viscosity in children with cystic fibrosis. Dornase alfa is administered by inhalation using a jet nebuliser (section 3.1.5), usually once daily at least 1 hour before physiotherapy; however, alternate-day therapy may be as effective as daily treatment. Not all children benefit from treatment with dornase alfa; improvement occurs within 2 weeks, but in more severely affected children a trial of 6–12 weeks may be required.

Nebulised **hypertonic sodium chloride** solution may improve mucociliary clearance in children with cystic fibrosis.

Mesna (*Mistabron*®), available from 'special-order' manufacturers or specialist importing companies, see p.943) is used in some children with cystic fibrosis when other mucolytics have failed to reduce sputum viscosity; 3–6 mL of a 20% solution is nebulised twice daily.

Acetylcysteine has been used to treat meconium ileus in neonates and distal intestinal obstruction syndrome in children with cystic fibrosis, but evidence of efficacy is lacking. *Gastrografin*® (section 1.6.5), or a bowel cleansing preparation containing macrogols (section 1.6.5), is usually more effective. Acetylcysteine may be used as a mucolytic to prevent further obstruction.

ACETYL CYSTEINE

Cautions history of peptic ulceration; asthma

Side-effects hypersensitivity-like reactions including rashes and anaphylaxis

Licensed use not licensed for use in meconium ileus or for distal intestinal obstructive syndrome in children with cystic fibrosis

Indication and dose

Meconium ileus (but see notes above)

- By mouth

NEONATE 200–400 mg up to 3 times daily if necessary

Treatment of distal intestinal obstructive syndrome (but see notes above)

- By mouth

Child 1 month–2 years 0.4–3 g as a single dose

Child 2–7 years 2–3 g as a single dose

Child 7–18 years 4–6 g as a single dose

Prevention of distal intestinal obstruction syndrome

- By mouth

Child 1 month–2 years 100–200 mg 3 times daily

Child 2–12 years 200 mg 3 times daily

Child 12–18 years 200–400 mg 3 times daily

Administration For *oral* administration, use oral granules, or dilute injection solution (200 mg/mL) to a concentration of 50 mg/mL; orange or blackcurrant juice or cola drink may be used as a diluent to mask the bitter taste

Acetylcysteine (Non-proprietary) (POM)

Oral granules, acetylcysteine 100 mg/sachet; 200 mg/sachet. Label: 13

Available from 'special-order' manufacturers or specialist importing companies, see p.943

Injection

See Emergency treatment of poisoning, p.38

CARBOCISTEINE

Cautions history of peptic ulceration

Pregnancy manufacturer advises avoid in first trimester

Contra-indications active peptic ulceration

Side-effects rarely gastro-intestinal bleeding; hypersensitivity reactions (including rash and anaphylaxis) also reported

Indication and dose

Reduction of sputum viscosity

- By mouth

Child 2–5 years 62.5–125 mg 4 times daily

Child 5–12 years 250 mg 3 times daily

Child 12–18 years initially 2.25 g daily in divided doses, then 1.5 g daily in divided doses as condition improves

Carbocisteine (Sanofi-Aventis) (POM)

Capsules, carbocisteine 375 mg, net price 120-cap pack = £16.68

Brands include *Mucodyne*[®]

Oral liquid, carbocisteine 125 mg/5 mL, net price 300 mL = £4.57; 250 mg/5 mL, 300 mL = £5.84

Brands include *Mucodyne*[®] *Paediatric* 125 mg/5 mL (cherry- and raspberry-flavoured) and *Mucodyne*[®] 250 mg/5 mL (cinnamon- and rum-flavoured)

DORNASE ALFA

Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase)

Cautions

Pregnancy no evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk

Breast-feeding amount probably too small to be harmful—manufacturer advises caution

Side-effects pharyngitis, voice changes, chest pain; occasionally laryngitis, rashes, urticaria, conjunctivitis

Indication and dose

Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function

- By inhalation of nebulised solution (by jet nebuliser)

Child 5–18 years 2500 units (2.5 mg) once daily

Pulmozyme[®] (Roche) (POM)

Nebuliser solution, dornase alfa 1000 units (1 mg)/mL. Net price 2.5-mL (2500 units) vial = £17.57

Note For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable

MECYSTEINE HYDROCHLORIDE

(Methyl Cysteine Hydrochloride)

Cautions history of peptic ulceration

Contra-indications

Pregnancy manufacturer advises avoid

Breast-feeding manufacturer advises avoid

Indication and dose

Reduction of sputum viscosity

- By mouth

Child 5–12 years 100 mg 3 times daily

▢ MECYSTEINE HYDROCHLORIDE (continued)

Child 12–18 years 200 mg 4 times daily for 2 days, then 200 mg 3 times daily for 6 weeks, then 200 mg twice daily

Visclair® (Ranbaxy)

Tablets, yellow, s/c, e/c, mecysteine hydrochloride 100 mg, net price 100 = £17.65. Label: 5, 22, 25

Hypertonic sodium chloride

Nebulised hypertonic sodium chloride solution (3–7%) is used to mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis).

MucoClear® (Pari)

Nebuliser solution, sodium chloride 6%, net price 20 × 4 mL = £12.98; 60 × 4 mL = £29.98

Dose

- By inhalation of nebulised solution
- Child** 4 mL twice daily

3.8 Aromatic inhalations

Inhalations containing volatile substances such as eucalyptus oil are traditionally used to relieve congestion and ease breathing. Although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting. Boiling water should not be used for inhalations owing to the risk of scalding.

Strong aromatic decongestants (applied as rubs or to pillows) are not recommended for infants under the age of 3 months. **Sodium chloride 0.9%** solution given as nasal drops can be used to liquefy mucous secretions and relieve nasal congestion in infants and young children.

Benzoïn Tincture, Compound, BP (Friars' Balsam)

Tincture, balsamic acids approx. 4.5%. Label: 15

Dose

Nasal congestion

- By inhalation

Add one teaspoonful to a pint of hot, **not** boiling, water and inhale the vapour

Menthol and Eucalyptus Inhalation, BP 1980

Inhalation, racementhol or levomenthol 2 g, eucalyptus oil 10 mL, light magnesium carbonate 7 g, water to 100 mL

Dose

Nasal congestion

- By inhalation

Add one teaspoonful to a pint of hot, **not** boiling, water and inhale the vapour

Dental prescribing on the NHS May be prescribed as Menthol and Eucalyptus Inhalation BP, 1980

Karvol® (Crookes) 

Inhalation capsules, levomenthol 35.55 mg, with chlorobutanol, pine oils, terpineol, and thymol, net price 10-cap pack = £2.25; 20-cap pack = £4.06

Inhalation solution, levomenthol 7.9%, with chlorobutanol, pine oils, terpineol, and thymol, net price 12-mL dropper bottle = £1.90

Dose

Nasal congestion

- By inhalation

Express into handkerchief or add to a pint of hot, **not** boiling, water the contents of 1 capsule or 6 drops of solution; avoid in infants under 3 months

3.9 Cough preparations

3.9.1 Cough suppressants

3.9.2 Expectorant and demulcent cough preparations

3.9.1 Cough suppressants

Cough may be a symptom of an underlying disorder such as asthma (section 3.1), gastro-oesophageal reflux disease (section 1.1), or rhinitis (section 12.2.1), which should be addressed before prescribing cough suppressants. Cough may be associated with smoking or environmental pollutants. Cough can also result from bronchiectasis including that associated with cystic fibrosis; cough can also have a significant habit component. There is little evidence of any significant

benefit from the use of cough suppressants in children with acute cough in ambulatory settings. Cough suppressants may cause sputum retention and this can be harmful in children with bronchiectasis.

The use of cough suppressants containing **pholcodine** or similar opioid analgesics is not generally recommended in children and should be avoided altogether in children under 6 years, see MHRA/CHM advice below.

Sedating antihistamines (section 3.4.1) are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

MHRA/CHM advice (March 2008 and February 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- brompheniramine, chlorphenamine, diphenhydramine, doxylamine, promethazine, or triprolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipecacuanha (expectorants);
- phenylephrine, pseudoephedrine, ephedrine, oxymetazoline, or xylometazoline (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

PHOLCODINE

Cautions may cause sputum retention

Contra-indications

Hepatic impairment avoid or reduce dose—may precipitate coma

Pregnancy avoid in third trimester, respiratory depression and withdrawal effects in neonate

Side-effects nausea, sputum retention, constipation

Indication and dose

Dry or painful cough (but not generally recommended for children, see notes above)

- By mouth

Child 6–12 years 2–5 mg 3–4 times daily

Child 12–18 years 5–10 mg 3–4 times daily

Pholcodine Linctus, BP

Linctus (= oral solution), pholcodine 5 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 1%. Net price 100 mL = 43p
Brands include *Pavacol-D*[®] (sugar-free), *Galenphol*[®] (sugar-free)

Pholcodine Linctus, Strong, BP

Linctus (= oral solution), pholcodine 10 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 2%. Net price 100 mL = 35p
Brands include *Galenphol*[®]

Galenphol[®] (Thornton & Ross)

Paediatric linctus (= oral solution), orange, sugar-free, pholcodine 2 mg/5 mL. Net price 90-mL pack = £1.11

3.9.2 Expectorant and demulcent cough preparations

Simple linctus and other demulcent cough preparations containing soothing substances, such as syrup or glycerol, may temporarily relieve a dry irritating cough. These preparations have the advantage of being harmless and inexpensive and sugar-free versions are available.

Expectorants are claimed to promote expulsion of bronchial secretions but there is no evidence that any drug can specifically facilitate expectoration.

Compound cough preparations for children are on sale to the public but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time, see MHRA/CHM advice above.

Simple Linctus, Paediatric, BP

Linctus (= oral solution), citric acid monohydrate 0.625% in a suitable vehicle with an anise flavour. Net price 100 mL = 72p

A sugar-free version is also available

Dose

Cough

- By mouth

Child 1 month–12 years 5–10 mL 3–4 times daily

Simple Linctus, BP

Linctus (= oral solution), citric acid monohydrate 2.5% in a suitable vehicle with an anise flavour. Net price 100 mL = 42p

A sugar-free version is also available

Dose**Cough**

- **By mouth**

Child 12–18 years 5 mL 3–4 times daily

3.10 Systemic nasal decongestants

Nasal congestion in children due to allergic or vasomotor rhinitis should be treated with oral antihistamines (section 3.4.1), topical nasal preparations containing corticosteroids (section 12.2.1), or topical decongestants (section 12.2.2).

There is little evidence to support the use of systemic decongestants in children.

Pseudoephedrine has few sympathomimetic effects, and is commonly combined with other ingredients (including antihistamines) in preparations intended for the relief of cough and cold symptoms but it should not be used in children under 6 years, see MHRA/CHM advice, p. 209.

PSEUDOEPHEDRINE HYDROCHLORIDE

Cautions hypertension, heart disease, diabetes, hyperthyroidism, raised intra-ocular pressure; **interactions:** Appendix 1 (sympathomimetics)

Hepatic impairment caution in severe hepatic impairment

Renal impairment manufacturer advises caution in moderate to severe renal impairment

Pregnancy defective closure of the abdominal wall (gastrochisis) reported very rarely in newborns after first trimester exposure

Breast-feeding amount too small to be harmful

Contra-indications treatment with MAOI within previous 2 weeks

Side-effects tachycardia, anxiety, restlessness, insomnia; *rarely* hallucinations, rash; urinary retention also reported

Indication and dose

Congestion of mucous membranes of upper respiratory tract

- **By mouth**

Child 6–12 years 30 mg 3–4 times daily

Child 12–18 years 60 mg 3–4 times daily

¹Galpseud® (Thornton & Ross) 

Tablets, pseudoephedrine hydrochloride 60 mg, net price 20 = £1.06

Linctus, orange, sugar-free, pseudoephedrine hydrochloride 30 mg/5 mL, net price 100 mL = 69p

¹Sudafed® (McNeil) 

Tablets, red, f/c, pseudoephedrine hydrochloride 60 mg, net price 24 = £2.12

Elixir, red, pseudoephedrine hydrochloride 30 mg/5 mL, net price 100 mL = £1.48

1. Can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see *Medicines, Ethics and Practice*, No. 32, London, Pharmaceutical Press, 2008 (and subsequent editions as available)

4.1 Hypnotics and anxiolytics

- 4.1.1 Hypnotics
- 4.1.2 Anxiolytics
- 4.1.3 Barbiturates

Most anxiolytics ('sedatives') will induce sleep when given at night and most hypnotics will sedate when given during the day. Hypnotics and anxiolytics should be reserved for short courses to alleviate acute conditions after causal factors have been established.

The role of drug therapy in the management of anxiety disorders in children and adolescents is uncertain; drug therapy should be initiated only by specialists after psychosocial interventions have failed. Benzodiazepines and tricyclic antidepressants have been used but adverse effects may be problematic.

Skilled tasks Hypnotics and anxiolytics may impair judgement and increase reaction time, and so affect ability to drive or perform skilled tasks; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair performance on the following day.

CSM advice

1. Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling or subjecting the individual to unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness.
2. The use of benzodiazepines to treat short-term 'mild' anxiety is inappropriate and unsuitable.
3. Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or subjecting the individual to extreme distress.

4.1.1 Hypnotics

The prescribing of hypnotics to children, except for occasional use such as for sedation for procedures (section 15.1.4), is not justified. There is a risk of habituation with prolonged use. Problems settling children at night should be managed with behavioural therapy.

Dental procedures Some anxious children may benefit from the use of a hypnotic for 1 to 3 nights before the dental appointment. Hypnotics do not relieve pain, and if pain interferes with sleep an appropriate analgesic should be given.

Chloral and derivatives

Chloral hydrate and derivatives were formerly popular hypnotics for children. **Triclofos** causes fewer gastro-intestinal disturbances than chloral hydrate.

Chloral hydrate and triclofos are now mainly used for sedation during diagnostic procedures (section 15.1.4) and in intensive care units. These drugs accumulate on prolonged use.

CHLORAL HYDRATE

Cautions reduce dose in debilitated; avoid prolonged use (and abrupt withdrawal thereafter); avoid contact with skin and mucous membranes; **interactions:** Appendix 1 (anxiolytics and hypnotics)

Hepatic impairment can precipitate coma; reduce dose in mild to moderate hepatic impairment; avoid in severe impairment

Skilled tasks Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications severe cardiac disease, gastritis, acute porphyria (section 9.8.2)

Renal impairment manufacturer advises avoid in severe impairment

Pregnancy avoid

Breast-feeding sedation in infant—manufacturer advises avoid

Side-effects gastric irritation (nausea and vomiting reported), abdominal distention, flatulence, headache, tolerance, dependence, excitement, delirium (especially on abrupt withdrawal), ketonuria, and rash

Licensed use not licensed for sedation for painless procedures

Indication and dose

Insomnia (but not recommended)

- By mouth or by rectum (if oral route not available)

Neonate 30–50 mg/kg at bedtime

Child 1 month–12 years 30–50 mg/kg (max. 1 g) at night

Child 12–18 years 0.5–1 g (max. 2 g) at night

Sedation for painless procedures

- By mouth or by rectum (if oral route not available)

Neonate 30–50 mg/kg 45–60 minutes before procedure; doses up to 100 mg/kg may be used with respiratory monitoring

Child 1 month–12 years 30–50 mg/kg (max. 1 g) 45–60 minutes before procedure; higher doses up to 100 mg/kg (max. 2 g) may be used

Child 12–18 years 1–2 g 45–60 minutes before procedure

Administration for administration by mouth dilute liquid with plenty of water or juice to mask unpleasant taste.

▢ CHLORAL HYDRATE (continued)

Chloral Mixture, BP 2000 ^(PoM) (Chloral Oral Solution)

Mixture, chloral hydrate 500 mg/5 mL in a suitable vehicle. Available from 'special-order' manufacturers or specialist importing companies, see p. 943

Chloral Elixir, Paediatric, BP 2000 ^(PoM) (Chloral Oral Solution, Paediatric)

Elixir, chloral hydrate 200 mg/5 mL (4%) in a suitable vehicle with a black currant flavour. Available from 'special-order' manufacturers or specialist importing companies, see p. 943

Chloral Hydrate (Non-proprietary) ^(PoM)

Suppositories, chloral hydrate 25 mg, 50 mg, 60 mg, 100 mg, 200 mg, 500 mg. Available from 'special-order' manufacturers or specialist importing companies, see p. 943

▲ Chloral betaine

Welldorm® (Alphashow) ^(PoM)

Tablets, blue-purple, f/c, chloral betaine 707 mg (= chloral hydrate 414 mg). Net price 30-tab pack = £7.90. Label: 19, 27

Dose

Short-term treatment of insomnia

• By mouth

Child 12–18 years 1–2 tablets with water or milk at bedtime, max. 5 tablets (chloral hydrate 2 g) daily

Elixir, red, chloral hydrate 143.3 mg/5 mL. Net price 150-mL pack = £6.67. Label: 19, 27

Dose

Short-term treatment of insomnia

• By mouth

Neonate 1–1.75 mL/kg (chloral hydrate 30–50 mg/kg) with water or milk at bedtime

Child 1 month–12 years 1–1.75 mL/kg (chloral hydrate 30–50 mg/kg) with water or milk at bedtime; max. 35 mL (chloral hydrate 1 g) daily

Child 12–18 years 15–45 mL (chloral hydrate 0.4–1.3 g) with water or milk at bedtime; max. 70 mL (chloral hydrate 2 g) daily

TRICLOFOS SODIUM

Cautions avoid prolonged use (and abrupt withdrawal thereafter); **interactions:** Appendix 1 (anxiolytics and hypnotics)

Hepatic impairment can precipitate coma

Renal impairment start with small doses in severe impairment, increased cerebral sensitivity

Skilled tasks Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications cardiac disease; gastritis; acute porphyria (section 9.8.2); pregnancy; breast-feeding

Side-effects abdominal distension, flatulence, gastric irritation including nausea and vomiting, dizziness, malaise, ataxia, drowsiness, headache, lightheadedness, vertigo, confusion, paranoia, excitement, nightmares, delirium (especially on abrupt withdrawal), ketonuria, blood disorders, skin reactions, and urticaria

Licensed use not licensed for sedation for painless procedures

Indication and dose

Insomnia (but not recommended)

• By mouth

Neonate 25–30 mg/kg at night

Child 1 month–1 year 25–30 mg/kg at night

Child 1–5 years 250–500 mg at night

Child 6–12 years 0.5–1 g at night

Child 12–18 years 1–2 g at night

Sedation for painless procedures

• By mouth

Neonate 25–30 mg/kg 45–60 minutes before procedure

Child 1 month–18 years 30–50 mg/kg (max. 2 g) 45–60 minutes before procedure; higher doses up to 100 mg/kg (max. 2 g) may be used but respiratory monitoring is required

Triclofos Oral Solution, BP ^(PoM) (Triclofos Elixir)

Oral solution, triclofos sodium 500 mg/5 mL. Net price 300 mL = £28.23. Label: 19

Antihistamines

Some **antihistamines** (section 3.4.1) such as promethazine are used for occasional insomnia in adults; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

The use of antihistamines as hypnotics in children is not usually justified.

PROMETHAZINE HYDROCHLORIDE

Cautions section 3.4.1

Contra-indications section 3.4.1

Side-effects section 3.4.1

Licensed use not licensed for use in children under 2 years

Indication and dose

Sedation (short-term use)

- By mouth

Child 2–5 years 15–20 mg

Child 5–10 years 20–25 mg

Child 10–18 years 25–50 mg

Sedation in intensive care

- By mouth or by slow intravenous injection or by deep intramuscular injection

Child 1 month–12 years 0.5–1 mg/kg (max. 25 mg) 4 times daily, adjusted according to response

Child 12–18 years 25–50 mg 4 times daily, adjusted according to response

Allergy and urticaria section 3.4.1

Nausea and vomiting section 4.6

Phenergan[®] (Rhône-Poulenc Rorer)

Injection ^(POM)1, promethazine hydrochloride 25 mg/mL, net price 1-mL amp = 70p

1. ^(POM) restriction does not apply where administration is for saving life in emergency

Oral preparations

Section 3.4.1

Melatonin

Melatonin is a pineal hormone which may affect sleep pattern. Clinical experience suggests that it may be of value for treating sleep onset insomnia and delayed sleep phase syndrome in children with conditions such as visual impairment, cerebral palsy, attention deficit hyperactivity disorder, autism, and learning difficulties. It is also sometimes used before magnetic resonance imaging (MRI), computed tomography (CT), or EEG investigations. Little is known about its long-term effects in children, but there is a theoretical basis for an effect on sexual development. Treatment with melatonin should be initiated and supervised by a specialist, but may be continued by general practitioners under a shared-care arrangement. The need for continuing melatonin therapy should be reviewed every 6 months.

MELATONIN

Cautions interactions: Appendix 1 (melatonin)

Renal impairment no information available—manufacturer advises caution

Contra-indications autoimmune disease

Hepatic impairment manufacturer advises avoid

Pregnancy no information available—manufacturer advises avoid

Breast-feeding present in milk—manufacturer advises avoid

Side-effects abdominal pain, constipation, dry mouth, weight gain, drowsiness, dizziness, migraine, asthenia, sleep disorders, restlessness, nervousness, irritability, and sweating; rarely flatulence, halitosis, hypersalivation, vomiting, hypertriglyceridaemia, aggression, agitation, fatigue, impaired memory, mood changes, hot flushes, priapism, increased libido, leucopenia,

thrombocytopenia, muscle cramp, lacrimation, visual disturbances, and skin reactions

Licensed use not licensed for use in children

Indication and dose

Sleep onset insomnia and delayed sleep phase syndrome (see notes above)

- By mouth

Child 1 month–18 years initially 2–3 mg increased if necessary after 1–2 weeks to 4–6 mg; max. 10 mg

Circadin[®] (Lundbeck) ▼ ^(POM)

Tablets, m/r, melatonin 2 mg, net price 21-tab pack = £10.77. Label: 2, 21, 25

Note Other formulations of melatonin are available from 'special-order' manufacturers or specialist importing companies, see p. 943

4.1.2 Anxiolytics

Anxiolytic treatment should be used in children only to relieve acute anxiety (and related insomnia) caused by fear (e.g. before surgery, section 15.1.4.1).

Anxiolytic treatment should be limited to the lowest possible dose for the shortest possible time (see CSM advice, section 4.1).

Buspirone

Buspirone is thought to act at specific serotonin (5HT_{1A}) receptors; safety and efficacy in children have yet to be determined.

4.1.3 Barbiturates

Classification not used in *BNF for Children*.

4.2 Drugs used in psychoses and related disorders**4.2.1 Antipsychotic drugs****4.2.2 Antipsychotic depot injections****4.2.3 Antimanic drugs****Advice on doses above *BNF for Children* upper limit**

1. Consider alternative approaches including adjuvant therapy.
2. Bear in mind risk factors, including obesity.
3. Consider potential for drug interactions—see **interactions**: Appendix 1 (antipsychotics).
4. Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and reduce dose if prolonged QT interval or other adverse abnormality develops.
5. Increase dose slowly and not more often than once weekly.
6. Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
7. Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

Important When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be **lower** than the corresponding oral dose (owing to absence of first-pass effect), particularly if the child is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for **each route** and should **not** imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least **daily**.

4.2.1 Antipsychotic drugs

There is little information on the efficacy and safety of antipsychotic drugs in children and adolescents and much of the information available has been extrapolated from adult data; in particular, little is known about the long-term effects of antipsychotic drugs on the developing nervous system. Antipsychotic drugs should be initiated and managed under the close supervision of an appropriate specialist.

Antipsychotic drugs are also known as ‘neuroleptics’ and (misleadingly) as ‘major tranquillisers’. Antipsychotic drugs generally tranquillise without impairing consciousness and without causing paradoxical excitement but they should not be regarded merely as tranquillisers. For conditions such as schizophrenia the tranquillising effect is of secondary importance.

In the short term they are used to calm disturbed children whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

Schizophrenia Antipsychotic drugs relieve florid psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse. Although they are usually less effective in apathetic withdrawn children, they sometimes appear to have an activating influence. Children with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a child with a definite diagnosis of schizophrenia may be necessary even after the first episode of illness in order to prevent the manifest illness from becoming chronic. Withdrawal of drug treatment requires careful surveillance because children who appear well on medication may suffer a disastrous relapse if treatment is withdrawn inappropriately. In addition the need for continuation of treatment may not become immediately evident because relapse is often delayed for several weeks after cessation of treatment.

Antipsychotic drugs are considered to act by interfering with dopaminergic transmission in the brain by blocking dopamine D_2 receptors, which may give rise to the extrapyramidal effects described below, and also to hyperprolactinaemia. Antipsychotic drugs may also affect cholinergic, alpha-adrenergic, histaminergic, and serotonergic receptors.

Choice of drug is influenced by the potential for side-effects and is often guided by individual circumstances e.g. the psychological effects of potential weight gain. The drugs most commonly used in children are haloperidol, risperidone, and olanzapine.

Cautions and contra-indications Antipsychotic drugs should be used with **caution** in children with hepatic impairment (can precipitate coma), renal impairment (start with small dose; increased cerebral sensitivity), cardiovascular disease, epilepsy (and conditions predisposing to epilepsy), depression, myasthenia gravis, or a personal or family history of angle-closure glaucoma (avoid chlorpromazine, pericyazine and prochlorperazine in these conditions). Caution is also required in severe respiratory disease and in children with a history of jaundice or who have blood dyscrasias (perform blood counts if unexplained infection or fever develops). As photosensitisation may occur with higher dosages, children should avoid direct sunlight.

Antipsychotic drugs may be **contra-indicated** in comatose states, CNS depression, and phaeochromocytoma. Most antipsychotic drugs are best avoided during pregnancy unless essential; extrapyramidal effects may occur in neonates. Although the amount present in breast milk is probably too small to be harmful, *animal* studies indicate possible adverse effects of these drugs on developing nervous system and therefore it is advisable to discontinue breast-feeding during treatment; **interactions**: Appendix 1 (antipsychotics).

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

Withdrawal Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse.

Side-effects Extrapyramidal symptoms are the most troublesome. They occur most frequently with the piperazine phenothiazines (such as perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (such as haloperidol), and the depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:

- *parkinsonian symptoms* (including tremor), which may appear gradually (but less commonly than in adults);
- *dystonia* (abnormal face and body movements) and *dyskinesia*, which appear after only a few doses;
- *akathisia* (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated; and
- *tardive dyskinesia* (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

Parkinsonian symptoms remit if the drug is withdrawn and may be suppressed by the administration of **antimuscarinic** drugs (section 4.9.2). However, routine administration of such drugs is not justified because not all children are affected and because they may unmask or worsen tardive dyskinesia.

Tardive dyskinesia is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia may occur and treatment must be carefully and regularly reviewed.

Hypotension and interference with temperature regulation are dose-related side-effects.

Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of some antipsychotic drugs. Discontinuation of the antipsychotic is essential because there is no proven effective treatment, but cooling, bromocriptine, and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

Other side-effects include: drowsiness; apathy; agitation, excitement and insomnia; convulsions; dizziness; headache; confusion; gastro-intestinal disturbances; nasal congestion; antimuscarinic symptoms (such as dry mouth, constipation, difficulty with micturition, and blurred vision); cardiovascular symptoms (such as hypotension, tachycardia, and arrhythmias); ECG changes (cases of sudden death have occurred); endocrine effects such as menstrual disturbances, galactorrhoea, gynaecomastia, impotence, and weight gain; blood dyscrasias (such as agranulocytosis and leucopenia), photosensitisation, contact sensitisation and rashes, and jaundice (including cholestatic); corneal and lens opacities, and purplish pigmentation of the skin, cornea, conjunctiva, and retina.

Overdosage: for poisoning with phenothiazines and related compounds, see Emergency Treatment of Poisoning, p. 43.

Classification of antipsychotics The **phenothiazine** derivatives can be divided into 3 main groups.

Group 1: chlorpromazine, levomepromazine (methotrimeprazine), and promazine, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.

Group 2: pericyazine and pipotiazine, generally characterised by moderate sedative effects, marked antimuscarinic effects, but fewer extrapyramidal side-effects than groups 1 or 3.

Group 3: perphenazine, prochlorperazine, and trifluoperazine, generally characterised by fewer sedative effects, fewer antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

Drugs of other chemical groups resemble the phenothiazines of *group 3* in their clinical properties. They include the **butyrophenones** (e.g. haloperidol); **diphenylbutylpiperidines** (e.g. pimozide); **thioxanthenes** (flupentixol and zuclopentixol); and the **substituted benzamides** (e.g. sulpiride).

For details of the newer antipsychotic drugs amisulpride, clozapine, olanzapine, quetiapine, and risperidone, see under Atypical Antipsychotics, p. 221.

Choice As indicated above, the various drugs differ somewhat in predominant actions and side-effects. Selection is influenced by the degree of sedation required and the child's susceptibility to extrapyramidal side-effects. However, the differences between antipsychotic drugs are less important than the great variability in response; moreover, tolerance to secondary effects such as sedation usually develops. The atypical antipsychotic drugs may be appropriate if extrapyramidal side-effects are a particular concern (see under Atypical Antipsychotics, p. 221). **Clozapine** is used for schizophrenia when other antipsychotic drugs are ineffective or not tolerated.

Prescribing of more than one antipsychotic drug at the same time is **not** recommended; it may constitute a hazard and there is no significant evidence that side-effects are minimised.

Chlorpromazine is still widely used despite the wide range of adverse effects associated with it. It has a marked sedating effect and is useful for treating violent children without causing stupor.

Pimozide (see CSM warning, p. 220) is less sedating than chlorpromazine.

Sulpiride in high doses controls florid positive symptoms, but in lower doses it has an alerting effect on children with apathetic withdrawn schizophrenia.

Haloperidol and **trifluoperazine** are also of value but their use is limited by the high incidence of extrapyramidal symptoms. Haloperidol may be preferred for the rapid control of hyperactive psychotic states; it causes less hypotension than chlorpromazine.

Other uses Nausea and vomiting (section 4.6), choreas, motor tics, and intractable hiccup.

Equivalent doses of oral antipsychotic drugs

These equivalences are intended **only** as an approximate guide; individual dosage instructions should **also** be checked; children should be carefully monitored after **any** change in medication

Antipsychotic drug	Daily dose
Chlorpromazine	100 mg
Clozapine	50 mg
Haloperidol	2–3 mg
Pimozide	2 mg
Risperidone	0.5–1 mg
Sulpiride	200 mg
Trifluoperazine	5 mg

Important These equivalences must **not** be extrapolated beyond the max. dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate

Dosage

After an initial period of stabilisation, the total daily oral dose can be given as a single dose in most children. For the advice of The Royal College of Psychiatrists on doses above the *BNF for Children* upper limit, see p. 215.

CHLORPROMAZINE HYDROCHLORIDE

Warning Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care

Cautions see notes above; also children should remain supine and the blood pressure monitored for 30 minutes after intramuscular injection

Contra-indications see notes above

Side-effects see notes above; also intramuscular injection may be painful, cause hypotension and tachycardia, and give rise to nodule formation

Indication and dose

Childhood schizophrenia and other psychoses (under specialist supervision)

- **By mouth**

Child 1–6 years 500 micrograms/kg every 4–6 hours adjusted according to response (max. 40 mg daily)

Child 6–12 years 10 mg 3 times daily, adjusted according to response (max. 75 mg daily)

Child 12–18 years 25 mg 3 times daily (*or* 75 mg at night), adjusted according to response, to usual maintenance dose of 75–300 mg daily (but up to 1 g daily may be required)

Relief of acute symptoms of psychoses (under specialist supervision) but see also Cautions and Side-effects

- **By deep intramuscular injection**

Child 1–6 years 500 micrograms/kg every 6–8 hours (max. 40 mg daily)

Child 6–12 years 500 micrograms/kg every 6–8 hours (max. 75 mg daily)

Child 12–18 years 25–50 mg every 6–8 hours

Induction of hypothermia (to prevent shivering) (under specialist supervision)

- **By deep intramuscular injection**

Child 1–12 years initially 0.5–1 mg/kg, followed by maintenance 500 micrograms/kg every 4–6 hours

Child 12–18 years 25–50 mg every 6–8 hours

Chlorpromazine (Non-proprietary) ^[POM]

Tablets, coated, chlorpromazine hydrochloride 25 mg, 28-tab pack = £3.35; 50 mg, 28-tab pack = £3.40; 100 mg, 28-tab pack = £3.57. Label: 2, 11 Brands include *Chloractil*[®]

Oral solution, chlorpromazine hydrochloride 25 mg/5 mL, net price 150 mL = £1.47, 100 mg/5 mL, 150 mL = £3.57. Label: 2, 11

Injection, chlorpromazine hydrochloride 25 mg/mL, net price 1-mL amp = 60p; 2-mL amp = 63p

Largactil[®] (Sanofi-Aventis) ^[POM]

Injection, chlorpromazine hydrochloride 25 mg/mL. Net price 2-mL amp = 63p

HALOPERIDOL

Cautions see notes above; also subarachnoid haemorrhage and metabolic disturbances such as hypokalaemia, hypocalcaemia, or hypomagnesaemia

Contra-indications see notes above

Side-effects see notes above, but less sedating and fewer antimuscarinic or hypotensive symptoms; pigmentation and photosensitivity reactions rare; extrapyramidal symptoms, particularly dystonic reactions and akathisia especially in thyrotoxic patients; rarely weight loss; hypoglycaemia; inappropriate antidiuretic hormone secretion

Licensed use not licensed for use in children for nausea and vomiting in palliative care

Indication and dose

Schizophrenia and other psychoses, mania, short-term adjunctive management of psychomotor agitation, excitement and violent or dangerously impulsive behaviour (under specialist supervision)

- By mouth

Child 12–18 years initially 0.5–3 mg 2–3 times daily or 3–5 mg 2–3 times daily in severely affected or resistant disease; in resistant schizophrenia up to 30 mg daily may be needed; adjusted according to response to lowest effective maintenance dose (as low as 5–10 mg daily)

Motor tics (including Tourette syndrome) (under specialist supervision)

- By mouth

Child 5–12 years 12.5–25 micrograms/kg twice daily, adjusted according to response up to 10 mg daily

Child 12–18 years 1.5 mg 3 times daily, adjusted according to response up to 10 mg daily

Nausea and vomiting in palliative care

- By mouth

Child 12–18 years 1.5 mg once daily at night, increased to 1.5 mg twice daily if necessary; max. 5 mg twice daily

- By continuous intravenous or subcutaneous infusion

Child 1 month–12 years 25–85 micrograms/kg over 24 hours

Child 12–18 years 1.5–5 mg over 24 hours

Haloperidol (Non-proprietary) (POM)

Tablets, haloperidol 500 micrograms, net price 28-tab pack = 91p; 1.5 mg, 28-tab pack = £1.62; 5 mg, 28-tab pack = £3.93; 10 mg, 28-tab pack = £4.27; 20 mg, 28-tab pack = £11.17. Label: 2

Dozic® (Rosemont) (POM)

Oral liquid, sugar-free, haloperidol 1 mg/mL, net price 100-mL pack = £6.86. Label: 2

Haldol® (Janssen-Cilag) (POM)

Tablets, both scored, haloperidol 5 mg (blue), net price 100-tab pack = £7.35; 10 mg (yellow), 100-tab pack = £14.37. Label: 2

Oral liquid, sugar-free, haloperidol 2 mg/mL, net price 100-mL pack (with pipette) = £4.72. Label: 2

Injection, haloperidol 5 mg/mL, net price 1-mL amp = 30p

Serenace® (IVAX) (POM)

Capsules, green, haloperidol 500 micrograms, net price 30-cap pack = 98p. Label: 2

Tablets, haloperidol 1.5 mg, net price 30-tab pack = £1.73; 5 mg (pink), 30-tab pack = £4.90; 10 mg (pale pink), 30-tab pack = £8.81. Label: 2

Oral liquid, sugar-free, haloperidol 2 mg/mL, net price 500-mL pack = £43.83. Label: 2

LEVOMEPRMAZINE

(Methotrimeprazine)

Cautions see notes above; children receiving large initial doses should remain supine

Contra-indications see notes above

Side-effects see notes above; occasionally raised erythrocyte sedimentation rate occurs

Indication and dose

Restlessness and confusion in palliative care

- By continuous subcutaneous infusion

Child 1–12 years 0.35–3 mg/kg over 24 hours

Child 12–18 years 12.5–200 mg over 24 hours

Nausea and vomiting in palliative care

- By continuous intravenous or subcutaneous infusion

Child 1 month–12 years 100–400 micrograms/kg over 24 hours

Child 12–18 years 5–25 mg over 24 hours

Administration for administration by *subcutaneous infusion* dilute with a suitable volume of Sodium Chloride 0.9%

Nozinan® (Link) (POM)

Tablets, scored, levomepromazine maleate 25 mg, net price 84-tab pack = £20.26. Label: 2

Injection, levomepromazine hydrochloride 25 mg/mL, net price 1-mL amp = £2.01

PERICIAZINE

(Periciazine)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; more sedating; hypotension common when treatment initiated; respiratory depression

▢ PERICAZINE (continued)

Licensed use tablets not licensed for use in children

Indication and dose

Schizophrenia, psychoses (severe mental or behavioural disorders only) (under specialist supervision)

- By mouth

Child 1–12 years initially 500 micrograms daily for 10-kg child, increased by 1 mg for each additional 5 kg to max. total daily dose of 10 mg; dose may be gradually increased according to response but maintenance should not exceed twice initial dose

Child 12–18 years initially 25 mg 3 times daily increased at weekly intervals by steps of 25 mg according to response; usual max. 100 mg 3 times daily; total daily dose may alternatively be given in 2 divided doses

Neulactil® (Sanofi-Aventis) (POM)

Tablets, yellow, scored, pericyazine 2.5 mg, net price 84-tab pack = £9.23; 10 mg, 84-tab pack = £24.95. Label: 2

Syrup forte, brown, pericyazine 10 mg/5 mL. Net price 100-mL pack = £12.08. Label: 2

PERPHENAZINE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; less sedating; extrapyramidal symptoms, especially dystonia, more frequent, particularly at high dosage; rarely systemic lupus erythematosus

Indication and dose

Schizophrenia and other psychoses, mania, short-term adjunctive management of anxiety, severe psychomotor agitation, excitement, violent or dangerously impulsive behaviour (under specialist supervision)

- By mouth

Child 14–18 years initially 4 mg 3 times daily adjusted according to the response; max. 24 mg daily

Fentazin® (Goldshield) (POM)

Tablets, both s/c, perphenazine 2 mg, net price 100-tab pack = £22.38; 4 mg, 100-tab pack = £26.34. Label: 2

PIMOZIDE

Cautions see notes above

CSM warning Following reports of sudden unexplained death, the CSM recommends ECG before treatment. The CSM also recommends that patients on pimozide should have an annual ECG (if the QT interval is prolonged, treatment should be reviewed and either withdrawn or dose reduced under close supervision) and that pimozide should **not** be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antimalarials, anti-arrhythmic drugs and certain antihistamines and should **not** be given with drugs which cause electrolyte disturbances (especially diuretics)

Contra-indications see notes above; history of arrhythmias or congenital QT prolongation

Side-effects see notes above; less sedating; serious arrhythmias reported; glycosuria and, rarely, hyponatraemia reported

Licensed use not licensed for use in Tourette syndrome

Indication and dose

Schizophrenia (under specialist supervision)

- By mouth

Child 12–18 years initially 1 mg daily, increased according to response in steps of 2–4 mg at intervals of not less than 1 week; usual dose range 2–20 mg daily

Tourette syndrome (under specialist supervision)

- By mouth

Child 2–12 years 1–4 mg daily

Child 12–18 years 2–10 mg daily

Orap® (Janssen-Cilag) (POM)

Tablets, scored, green, pimozide 4 mg, net price 100-tab pack = £27.41. Label: 2

SULPIRIDE

Cautions see notes above; also excited, agitated, or aggressive children (even low doses may aggravate symptoms)

Pregnancy limited experience in humans but no evidence of harm in animal studies

Contra-indications see notes above; also acute porphyria (section 9.8.2)

Side-effects see notes above; also hepatitis

Licensed use not licensed for use in Tourette syndrome

Indication and dose

Schizophrenia (under specialist supervision)

- By mouth

Child 14–18 years 200–400 mg twice daily; max. 800 mg daily in predominantly negative

⚠️ **SULPIRIDE** (continued)

symptoms, dose increased to max. 2.4 g daily in mainly positive symptoms

Tourette syndrome (under specialist supervision)

- **By mouth**

Child 2–12 years 50–400 mg twice daily

Child 12–18 years 100–400 mg twice daily

Sulpiride (Non-proprietary) (POM)

Tablets, sulpiride 200 mg, net price 30-tab pack = £6.92; 56-tab pack = £6.46; 400 mg, 30-tab pack = £12.87. Label: 2

Dolmatil® (Sanofi-Synthelabo) (POM)

Tablets, both scored, sulpiride 200 mg, net price 100-tab pack = £13.85; 400 mg (f/c), 100-tab pack = £36.29. Label: 2

Sulpor® (Rosemont) (POM)

Oral solution, sugar-free, lemon- and aniseed-flavoured, sulpiride 200 mg/5 mL, net price 150 mL = £25.38. Label: 2

TRIFLUOPERAZINE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; extrapyramidal symptoms more frequent, especially at doses exceeding 6 mg daily; pancytopenia; thrombocytopenia; hyperthermia; anorexia

Indication and dose

Schizophrenia and other psychoses, short-term adjunctive management of psychomotor agitation, excitement and violent or dangerously impulsive behaviour (under specialist supervision)

- **By mouth**

Child 12–18 years initially 5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to response

Short-term adjunctive management of severe anxiety (under specialist supervision)

- **By mouth**

Child 3–6 years up to 500 micrograms twice daily

Child 6–12 years up to 2 mg twice daily

Child 12–18 years 1–2 mg twice daily, increased if necessary to 3 mg twice daily

Antiemetic section 4.6

Trifluoperazine (Non-proprietary) (POM)

Tablets, coated, trifluoperazine (as hydrochloride) 1 mg, net price 100-tab pack = £6.10; 5 mg, 100-tab pack = £5.32. Label: 2

Oral solution, trifluoperazine (as hydrochloride) 5 mg/5 mL, net price 150-mL pack = £9.33. Label: 2

Stelazine® (Goldshield) (POM)

Tablets, blue, f/c, trifluoperazine (as hydrochloride) 1 mg, net price 112-tab pack = £3.43; 5 mg, 112-tab pack = £4.89. Label: 2

Syrup, sugar-free, yellow, trifluoperazine (as hydrochloride) 1 mg/5 mL, net price 200-mL pack = £2.95. Label: 2

Atypical antipsychotics

The 'atypical antipsychotic' drugs **amisulpride**, **clozapine**, **olanzapine**, **quetiapine**, and **risperidone** may be better tolerated than other antipsychotic drugs; extrapyramidal symptoms may be less frequent than with older antipsychotic drugs.

Clozapine, olanzapine, and quetiapine cause little or no elevation of prolactin concentration; when changing from other antipsychotic drugs, a reduction in prolactin may increase fertility.

Clozapine is used for the treatment of schizophrenia only in children unresponsive to, or intolerant of, conventional antipsychotic drugs. It can cause agranulocytosis and its use is restricted to patients registered with a clozapine Patient Monitoring Service (see under Clozapine).

Cautions and contra-indications While atypical antipsychotic drugs have not generally been associated with clinically significant prolongation of the QT interval, they should be used with care if prescribed with other drugs that increase the QT interval. Atypical antipsychotic drugs should be used with caution in children with cardiovascular disease, or a history of epilepsy; **interactions:** Appendix 1 (antipsychotics).

Skilled tasks Atypical antipsychotic drugs may affect performance of skilled tasks (e.g. driving); effects of alcohol are enhanced.

Withdrawal Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse.

Side-effects Side-effects of the atypical antipsychotic drugs include weight gain, dizziness, postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some children, extrapyramidal symptoms (usually mild and transient and which respond to dose reduction or to an antimuscarinic drug), and occasionally tardive dyskinesia on long-term administration (discontinue drug on appearance of early signs). Hyperglycaemia and sometimes diabetes can occur, particularly with clozapine, olanzapine and risperidone; monitoring weight and plasma glucose may identify the development of hyperglycaemia. Neuroleptic malignant syndrome has been reported rarely. Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide (p. 245) provided that patients are not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.

AMISULPRIDE

Cautions see notes above

Renal impairment halve dose if estimated glomerular filtration rate 30–60 mL/minute/1.73 m²; use one-third dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; no information available if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Contra-indications see notes above; phaeochromocytoma, prolactin-dependent tumours

Pregnancy avoid

Breast-feeding avoid

Side-effects see notes above; also insomnia, anxiety, agitation, drowsiness, gastro-intestinal disorders such as constipation, nausea, vomiting, and dry mouth; hyperprolactinaemia; *occasionally* bradycardia; *rarely* seizures

Indication and dose

Acute psychotic episode (under specialist supervision)

• **By mouth**

Child 15–18 years 200–400 mg twice daily adjusted according to response; max. 1.2 g daily

Predominantly negative symptoms (under specialist supervision)

• **By mouth**

Child 15–18 years 50–300 mg daily

Amisulpride (Non-proprietary) (POM)

Tablets, amisulpride 50 mg, net price 60-tab pack = £19.00; 100 mg, 60-tab pack = £33.73; 200 mg, 60-tab pack = £56.47; 400 mg, 60-tab pack = £112.45. Label: 2

Solian[®] (Sanofi-Synthelabo) (POM)

Tablets, scored, amisulpride 50 mg, net price 60-tab pack = £23.69; 100 mg, 60-tab pack = £36.72; 200 mg, 60-tab pack = £61.38, 400 mg, 60-tab pack = £122.76. Label: 2

Solution, 100 mg/mL, net price 60 mL (caramel flavour) = £30.69. Label: 2

CLOZAPINE

Cautions see notes above; monitor leucocyte and differential blood counts (see Agranulocytosis, below); susceptibility to angle-closure glaucoma; taper off other antipsychotics before starting; close medical supervision during initiation (risk of collapse because of hypotension)

Hepatic impairment monitor hepatic function regularly; avoid in symptomatic, or progressive liver disease or hepatic failure

Pregnancy manufacturers advise caution

Withdrawal On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe child carefully

Agranulocytosis Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm³ or if absolute neutrophil count below 1500/mm³ discontinue permanently and refer to haematologist. Avoid drugs which depress leucopoiesis; children (or carers) should

report immediately symptoms of infection, especially influenza-like illness

Myocarditis and cardiomyopathy Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported. The CSM has advised:

- physical examination and medical history before starting clozapine;
- specialist examination if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk;
- persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy;
- if myocarditis or cardiomyopathy suspected clozapine should be stopped and child evaluated urgently by cardiologist;
- discontinue permanently in clozapine-induced myocarditis or cardiomyopathy

Gastro-intestinal obstruction Reactions resembling gastro-intestinal obstruction reported. Clozapine should be used cautiously with drugs which cause constipation (e.g. antimuscarinic drugs) or in children with history of colo-

◊ CLOZAPINE (continued)

nic disease or bowel surgery. Monitor for constipation and prescribe laxative if required

Contra-indications severe cardiac disorders (e.g. myocarditis; see Cautions); history of neutropenia or agranulocytosis (see Cautions); bone-marrow disorders; paralytic ileus (see Cautions); alcoholic and toxic psychoses; history of circulatory collapse; drug intoxication; coma or severe CNS depression; uncontrolled epilepsy

Renal impairment manufacturer advises avoid in severe renal impairment

Breast-feeding avoid

Side-effects see notes above; also constipation (see Cautions), hypersalivation, dry mouth, nausea, vomiting, anorexia; tachycardia, ECG changes, hypertension; drowsiness, headache, tremor, seizures, fatigue, impaired temperature regulation; urinary incontinence and retention; leucopenia, eosinophilia, leucocytosis; blurred vision; sweating; *less commonly* agranulocytosis (**important**: see Cautions); *rarely* dysphagia, hepatitis, cholestatic jaundice, pancreatitis, circulatory collapse, arrhythmia, myocarditis (**important**: see Cautions), pericarditis, thromboembolism, agitation, confusion, delirium, anaemia; *very rarely* parotid gland enlargement, intestinal obstruction (see Cautions), cardiomyopathy, myocardial infarction, respiratory depression, priapism, interstitial nephritis, thrombocytopenia, thrombocytopenia, hyperlipidaemia, fulminant hepatic necrosis, and skin reactions

Licensed use not licensed for use in children under 16 years

Indication and dose

Schizophrenia in children unresponsive to, or intolerant of, conventional antipsychotic drugs (under specialist supervision)

• By mouth

Child 12–18 years 12.5 mg once or twice on first day then 25–50 mg on second day then

increased gradually (if well tolerated) in steps of 25–50 mg daily over 14–21 days up to 300 mg daily in divided doses (larger dose at night, up to 200 mg daily may be taken as a single dose at bedtime); if necessary may be further increased in steps of 50–100 mg once (preferably) or twice weekly; usual dose 200–450 mg daily (max. 900 mg daily)

Note Restarting after interval of more than 2 days, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

Clozaril® (Novartis) (POM)

Tablets, yellow, clozapine 25 mg (scored), net price 28-tab pack = £6.17, 84-tab pack (hosp. only) = £18.49; 100 mg, 28-tab pack = £24.64, 84-tab pack (hosp. only) = £73.92. Label: 2, 10, patient information leaflet

Note Child, prescriber, and supplying pharmacist must be registered with the Clozaril Patient Monitoring Service—takes several days to do this

Denzapine® (Merz) (POM)

Tablets, yellow, scored, clozapine 25 mg, net price 28-tab pack = £6.17, 84-tab pack = £18.49; 100 mg, 28-tab pack = £24.64, 84-tab pack = £73.92. Label: 2, 10, patient information leaflet

Note Child, prescriber, and supplying pharmacist must be registered with the Denzapine Patient Monitoring Service—takes several days to do this

Zaponex® (IVAX) (POM)

Tablets, yellow, scored, clozapine 25 mg, net price 84-tab pack = £22.17; 100 mg, 84-tab pack = £50.00. Label: 2, 10, patient information leaflet

Note Child, prescriber, and supplying pharmacist must be registered with the Zaponex Treatment Access System—takes several days to do this

OLANZAPINE

Cautions see notes above; also susceptibility to angle-closure glaucoma, paralytic ileus, diabetes mellitus (risk of exacerbation or ketoacidosis), low leucocyte or neutrophil count, bone-marrow depression, hyper-eosinophilic disorders, myeloproliferative disease

Hepatic impairment initial dose 5mg daily, increased slowly

Renal impairment initial dose 5mg daily, increased slowly

Pregnancy manufacturer advises use only if potential benefit outweighs risk; neonatal lethargy, tremor and hypertonia reported when used in third trimester

Contra-indications

Breast-feeding manufacturer advises avoid—present in milk

Side-effects see notes above; also mild, transient antimuscarinic effects; drowsiness, speech difficulty, abnormal gait, hallucinations, akathisia, asthenia, increased appetite, increased body

temperature, raised triglyceride concentration, oedema, hyperprolactinaemia (but clinical manifestations rare); urinary incontinence; eosinophilia; *less commonly* hypotension, bradycardia, QT interval prolongation, photosensitivity; *rarely* seizures, leucopenia, rash; *very rarely* thromboembolism, hypercholesterolaemia, hypothermia, urinary retention, priapism, thrombocytopenia, neutropenia, rhabdomyolysis, hepatitis, pancreatitis; *with injection*, injection-site reactions, sinus pause, hypoventilation

Licensed use not licensed for use in children

Indication and dose

Schizophrenia, combination therapy for mania (under specialist supervision)

• By mouth

Child 12–18 years initially 5–10 mg daily adjusted to usual range of 5–20 mg daily; doses greater than 10 mg daily only after reassessment; max. 20 mg daily

OLANZAPINE (continued)

Monotherapy for mania (under specialist supervision)

- **By mouth**

Child 12–18 years 15 mg daily adjusted to usual range of 5–20 mg daily; doses greater than 15 mg only after reassessment; max. 20 mg daily

Note When one or more factors present that might result in slower metabolism (e.g. female gender, non-smoker) consider lower initial dose and more gradual dose increase

Zyprexa[®] (Lilly) (POM)

Tablets, f/c, olanzapine 2.5 mg, net price 28-tab pack = £33.29; 5 mg, 28-tab pack = £48.78; 7.5 mg,

56-tab pack = £146.34; 10 mg, 28-tab pack = £79.45, 15 mg (blue), 28-tab pack = £119.18; 20 mg (pink), 28-tab pack = £158.90. Label: 2

Orodispersible tablet (Velotab[®]), yellow, olanzapine 5 mg, net price 28-tab pack = £48.78; 10 mg, 28-tab pack = £79.45; 15 mg, 28-tab pack = £119.18; 20 mg, 28-tab pack = £158.90. Label: 2, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling *Velotab[®]* may be placed on the tongue and allowed to dissolve or dispersed in water, orange juice, apple juice, milk, or coffee

QUETIAPINE

Cautions see notes above; cerebrovascular disease

Hepatic impairment manufacturer advises initial dose of 25 mg daily

Renal impairment manufacturer advises initial dose of 25 mg daily

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Contra-indications

Breast-feeding avoid

Side-effects see notes above; also drowsiness, dyspepsia, constipation, dry mouth, mild asthenia, rhinitis, tachycardia; leucopenia, neutropenia and occasionally eosinophilia reported; elevated plasma-triglyceride and cholesterol concentrations; reduced plasma-thyroid hormone concentrations; possible QT interval prolongation; rest-

less leg syndrome; *rarely* oedema; *very rarely* priapism

Licensed use not licensed for use in children

Indication and dose

Schizophrenia (under specialist supervision)

- **By mouth**

Child 12–18 years initially 25 mg twice daily adjusted in steps of 25–50 mg according to response; max. 750 mg daily

Seroquel[®] (AstraZeneca) (POM)

Tablets, f/c, quetiapine (as fumarate) 25 mg (peach), net price 60-tab pack = £33.83; 100 mg (yellow), 60-tab pack = £113.10; 150 mg (pale yellow), 60-tab pack = £113.10; 200 mg (white), 60-tab pack = £113.10; 300 mg (white), 60-tab pack = £170.00. Label: 2

RISPERIDONE

Cautions see notes above; monitor height, body-weight, bowel habit, pulse, blood pressure, and developmental status including sexual maturation; assess for movement disorders before starting and monitor neurological parameters during treatment; family history of sudden cardiac death (perform ECG)

Hepatic impairment initially 500 micrograms twice daily increased in steps of 500 micrograms twice daily to 1–2 mg twice daily

Renal impairment initially 500 micrograms twice daily increased in steps of 500 micrograms twice daily to 1–2 mg twice daily

Pregnancy manufacturer advises use only if potential benefit outweighs risk; extrapyramidal effects reported in neonate when taken in third trimester

Contra-indications breast-feeding

Side-effects see notes above; also sleep disturbances, agitation, anxiety, and headache; *less commonly* constipation, nausea and vomiting, dyspepsia, abdominal pain, hypertension, impaired concentration, dizziness, fatigue, hyperprolactinaemia, sexual dysfunction, urinary incontinence, abnormal vision, and rash; *rarely* seizures, hyponatraemia, abnormal temperature

regulation, and epistaxis; oedema and blood disorders also reported

Licensed use not licensed for use in children under 15 years for psychoses; not licensed for use in autism

Indication and dose

Acute and chronic psychoses (under specialist supervision)

- **By mouth**

Child 12–18 years 2 mg in 1–2 divided doses on first day *then* 4 mg in 1–2 divided doses on second day (slower titration appropriate in some children); usual dose range 4–6 mg daily; doses above 10 mg daily only if benefit considered to outweigh risk (max. 16 mg daily)

Short-term treatment (up to 6 weeks) of persistent aggression in conduct disorder (under specialist supervision)

- **By mouth**

Child 5–18 years and body-weight under 50 kg initially 250 micrograms once daily increased according to response in steps of 250 micrograms on alternate days; usual dose 500 micrograms daily (up to 750 micrograms once daily has been required)

◁ RISPERIDONE (continued)

Child 5–18 years and body-weight over 50 kg initially 500 micrograms once daily increased according to response in steps of 500 micrograms on alternate days; usual dose 1 mg daily (up to 1.5 mg once daily has been required)

Short-term treatment of severe aggression in autism (under specialist supervision)

• By mouth

Child over 5 years and 15–20 kg 250 micrograms daily increased if necessary after 3 days to 500 micrograms daily; thereafter increased by 250 micrograms daily at 2-week intervals to max. 1.5 mg daily

Child over 20 kg up to 12 years 250 micrograms daily increased if necessary after 3 days to 750 micrograms daily; thereafter increased by 500 micrograms daily at 2-week intervals; max. daily dose 2.5 mg if under 45 kg; max. daily dose 3.5 mg if over 45 kg

Risperidone (Non-proprietary) ▼ (POM)

Tablets, risperidone 500 micrograms, net price 20-tab pack = £4.34; 1 mg, 20-tab pack = £7.62, 60-tab pack = £17.93; 2 mg, 60-tab pack = £41.80; 3 mg, 60-tab pack = £60.69; 4 mg, 60-tab pack = £81.15; 6 mg, 28-tab pack = £57.87. Label: 2

Orodispersible tablets, risperidone 1 mg, net price 28-tab pack = £18.39; 2 mg 28-tab pack = £33.31. Label: 2, counselling, administration

Counselling Tablets should be placed on the tongue, allowed to dissolve and swallowed

Liquid, risperidone 1 mg/mL, net price 100-mL pack = £55.25. Label: 2, counselling, use of dose syringe

Note Liquid may be diluted with mineral water, orange juice or black coffee (should be taken immediately)

Risperdal® (Janssen-Cilag) ▼ (POM)

Tablets, f/c, scored, risperidone 500 micrograms (brown-red), net price 20-tab pack = £7.06; 1 mg (white), 20-tab pack = £11.61, 60-tab pack = £34.84; 2 mg (orange), 60-tab pack = £68.69; 3 mg (yellow), 60-tab pack = £101.01; 4 mg (green), 60-tab pack = £133.34; 6 mg (yellow), 28-tab pack = £94.28. Label: 2

Orodispersible tablets (Quicklet®), pink, risperidone 500 micrograms, net price 28-tab pack = £11.43; 1 mg, 28-tab pack = £18.39; 2 mg, 28-tab pack = £34.66; 3 mg, 28-tab pack = £50.34; 4 mg, 28-tab pack = £64.84. Label: 2, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling Tablets should be placed on the tongue, allowed to dissolve and swallowed

Liquid, risperidone 1 mg/mL, net price 100-mL pack = £56.12. Label: 2, counselling, use of dose syringe

Note Liquid may be diluted with mineral water, orange juice or black coffee (should be taken immediately)

4.2.2 Antipsychotic depot injections

There is limited information on the use of antipsychotic depot injections in children and use should be restricted to specialist centres.

4.2.3 Antimanic drugs

Drugs are used in mania to control acute attacks and to prevent their recurrence.

Benzodiazepines

Use of benzodiazepines (section 4.1) may be helpful in the initial stages of treatment until lithium achieves its full effect; they should not be used for long periods because of the risk of dependence.

Antipsychotic drugs

In an acute attack of mania, treatment with an antipsychotic drug (section 4.2.1) is usually required because it may take a few days for lithium to exert its antimanic effect. Lithium may be given concurrently with the antipsychotic drug, and treatment with the antipsychotic gradually tailed off as lithium becomes effective. Alternatively, lithium therapy may be commenced once the child's mood has been stabilised with the antipsychotic. The adjunctive use of atypical antipsychotics such as olanzapine (section 4.2.1) and risperidone with either lithium or valproic acid may also be of benefit.

High doses of haloperidol may be hazardous when used with lithium; irreversible toxic encephalopathy has been reported.

Carbamazepine

Carbamazepine (section 4.8.1) may be used for the prophylaxis of bipolar disorder (manic-depressive disorder) in children unresponsive to lithium; it seems to be

particularly effective in those with rapid-cycling manic-depressive illness (4 or more affective episodes per year).

Valproic acid

Valproic acid (as the semisodium salt) is licensed in adults for the treatment of manic episodes associated with bipolar disorder. It may be useful in children unresponsive to lithium. Sodium valproate (section 4.8.1) has also been used.

Lithium

Lithium salts are used in the prophylaxis and treatment of mania, in the prophylaxis of bipolar disorder (manic-depressive disorder) and in the prophylaxis of recurrent depression (unipolar illness or unipolar depression). Lithium should be used in children only on the advice of a specialist.

The decision to give prophylactic lithium must be based on careful consideration of the likelihood of recurrence in the individual child, and the benefit weighed against the risks. In long-term use lithium has been associated with thyroid disorders and mild cognitive and memory impairment. Long-term treatment should therefore be undertaken only with careful assessment of risk and benefit, and with regular monitoring of thyroid function. The need for continued therapy should be assessed regularly and children should be maintained on lithium after 3–5 years only if benefit persists.

Serum concentrations Lithium salts have a narrow therapeutic/toxic ratio and should not be prescribed unless facilities for monitoring serum-lithium concentrations are available. There seem few if any reasons for preferring one or other of the salts of lithium available. Doses are adjusted to achieve serum-lithium concentration of 0.4–1 mmol/litre on samples taken 12 hours after the preceding dose. It is important to determine the optimum range for each individual child.

Overdosage, usually with serum-lithium concentration of over 1.5 mmol/litre, may be fatal and toxic effects include tremor, ataxia, dysarthria, nystagmus, renal impairment, and convulsions. If these potentially hazardous signs occur, treatment should be stopped, serum-lithium concentrations redetermined, and steps taken to reverse lithium toxicity. In mild cases withdrawal of lithium and administration of generous amounts of sodium and fluid will reverse the toxicity. Serum-lithium concentration in excess of 2 mmol/litre require urgent treatment as indicated under Emergency Treatment of Poisoning, p. 42.

Interactions Lithium toxicity is made worse by sodium depletion, therefore concurrent use of diuretics (particularly thiazides) is hazardous and should be avoided. For other **interactions** with lithium, see Appendix 1 (lithium).

Withdrawal While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of a few weeks and children and carers should be warned of possible relapse if it is discontinued abruptly.

Lithium cards

A lithium treatment card available from pharmacies tells children and carers how to take lithium preparations, what to do if a dose is missed, and what side-effects to expect. It also explains why regular blood tests are important and warns that some medicines and illnesses can change serum-lithium concentration.

Cards may be purchased from the National Pharmacy Association.

Tel: (01727) 858 687 sales@npa.co.uk

LITHIUM CARBONATE

Cautions measure serum-lithium concentration regularly (every 3 months on stabilised regimens), measure renal function and thyroid function every 6–12 months on stabilised regimens and advise children and carers to seek attention if symptoms of hypothyroidism develop (females

are at greater risk) e.g. lethargy, feeling cold; maintain adequate sodium and fluid intake; test renal function before initiating and if evidence of toxicity, avoid in cardiac disease, and conditions with sodium imbalance such as Addison's disease; reduce dose or discontinue in diarrhoea,

◊ LITHIUM CARBONATE (continued)

vomiting and intercurrent infection (especially if sweating profusely); psoriasis (risk of exacerbation); diuretic treatment, myasthenia gravis; surgery (section 15.1); if possible avoid abrupt withdrawal (see notes above); **interactions:** Appendix 1 (lithium)

Counselling Children should maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake; lithium treatment cards are available from pharmacies (see above)

Renal impairment avoid if possible or reduce dose and monitor serum-lithium concentration carefully

Pregnancy avoid if possible in first trimester (risk of teratogenicity, including cardiac abnormalities); dose requirements increased in second and third trimesters (but return to normal abruptly on delivery); close monitoring of serum-lithium concentration advised (risk of toxicity in neonate)

Breast-feeding present in milk and risk of toxicity in infant—manufacturer advises avoid

Side-effects gastro-intestinal disturbances, fine tremor, renal impairment (particularly impaired urinary concentration and polyuria), polydipsia, leucocytosis; also weight gain and oedema (may respond to dose reduction); hyperparathyroidism and hypercalcaemia reported; signs of intoxication are blurred vision, increasing gastro-intestinal disturbances (anorexia, vomiting, diarrhoea), muscle weakness, increased CNS disturbances (mild drowsiness and sluggishness increasing to giddiness with ataxia, coarse tremor, lack of co-ordination, dysarthria), and require withdrawal of treatment; with severe **overdosage** (serum-lithium concentration above 2 mmol/litre) hyperreflexia and hyperextension of limbs, convulsions, toxic psychoses, syncope, renal failure, circulatory failure, coma, and occasionally, death; goitre, raised antidiuretic hormone concentration, hypothyroidism, hypokalaemia, ECG changes, and kidney changes may also occur; see also Emergency Treatment of Poisoning, p. 42

Indication and dose

Treatment and prophylaxis of mania, bipolar disorder, recurrent depression (see also notes above), aggressive or self-mutilating behaviour

• By mouth

See under preparations below, adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has

remained constant for 4 weeks and every 3 months thereafter; doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Note Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment

Note Lithium carbonate 200 mg \equiv lithium citrate 509 mg

Camcolit® (Norgine) (POM)

Camcolit 250® tablets, f/c, scored, lithium carbonate 250 mg (Li^+ 6.8 mmol), net price 100-tab pack = £3.09 Label: 10, lithium card, counselling, see above

Camcolit 400® tablets, m/r, f/c, scored, lithium carbonate 400 mg (Li^+ 10.8 mmol), net price 100-tab pack = £4.13. Label: 10, lithium card, 25, counselling, see above

Dose

Treatment

• By mouth

(see above for advice on bioavailability and serum-lithium monitoring)

Child 12–18 years initially 1–1.5 g daily

Prophylaxis

• By mouth

(see above for advice on bioavailability and serum-lithium monitoring)

Child 12–18 years initially 300–400 mg daily

Liskonum® (GSK) (POM)

Tablets, m/r, f/c, scored, lithium carbonate 450 mg (Li^+ 12.2 mmol), net price 60-tab pack = £2.88.

Label: 10, lithium card, 25, counselling, see above

Dose

Treatment

• By mouth

(see above for advice on bioavailability and serum-lithium monitoring)

Child 12–18 years initially 225–675 mg twice daily

Prophylaxis

• By mouth

(see above for advice on bioavailability and serum-lithium monitoring)

Child 12–18 years initially 225–450 mg twice daily

LITHIUM CITRATE

Cautions see under Lithium Carbonate and notes above

Counselling Patients should maintain an adequate fluid intake and should avoid dietary changes which might reduce or increase sodium intake; lithium treatment cards are available from pharmacies (see above)

Side-effects see under Lithium Carbonate and notes above

Licensed use not licensed for use in children

Indication and dose

See under Lithium Carbonate and notes above

• By mouth

Adjust to achieve serum-lithium concentration of 0.4–1 mmol/litre as described under Lithium Carbonate above

Note Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment

Note Lithium carbonate 200 mg \equiv lithium citrate 509 mg

□ LITHIUM CITRATE (*continued*)

Li-Liquid® (Rosemont) (POM)

Oral solution, lithium citrate 509 mg/5 mL (Li⁺ 5.4 mmol/5 mL), yellow, net price 150-mL pack = £5.79; 1.018 g/5 mL (Li⁺ 10.8 mmol/5 mL), orange, 150-mL pack = £11.58. Label: 10, lithium card, counselling, see above

Priadel® (Sanofi-Synthelabo) (POM)

Liquid, sugar-free, lithium citrate 520 mg/5 mL (approx. Li⁺ 5.4 mmol/5 mL), net price 150-mL pack = £5.84. Label: 10, lithium card, counselling, see above

4.3 Antidepressant drugs

- 4.3.1 Tricyclic antidepressant drugs
- 4.3.2 Monoamine-oxidase inhibitors
- 4.3.3 Selective serotonin re-uptake inhibitors
- 4.3.4 Other antidepressant drugs

Depression in children should be managed by an appropriate specialist and treatment should involve psychological therapy.

The major classes of antidepressant drugs include the tricyclics and related antidepressant drugs, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs).

Choice of antidepressant drug should be based on the individual child's requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy.

When drug treatment of depression is considered necessary in children, the SSRIs should be considered first-line treatment; following a safety and efficacy review, **fluoxetine** is licensed to treat depression in children.

Tricyclic antidepressant drugs should generally be avoided for the treatment of depression in children.

St John's wort (*Hypericum perforatum*) is a popular unlicensed herbal remedy for treating mild depression in adults. In the absence of adequate evidence of safety or efficacy in children, St John's wort should not be used for the treatment of depression in children. It interacts with a number of conventional drugs, see Appendix 1 (St John's wort).

Hyponatraemia and antidepressant therapy

Hyponatraemia (possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressant drugs. The CSM has advised that hyponatraemia should be considered in all children who develop drowsiness, confusion, or convulsions while taking an antidepressant drug.

Suicidal behaviour and antidepressant therapy

The use of antidepressant drugs has been linked with suicidal thoughts and behaviour. Where necessary, children should be monitored for suicidal behaviour, self-harm, and hostility, particularly at the beginning of treatment or if the dose is changed.

Withdrawal Gastro-intestinal symptoms of nausea, vomiting, and anorexia, accompanied by headache, giddiness, 'chills', and insomnia, and sometimes by hypomania, panic-anxiety, and extreme motor restlessness may occur if an antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in children who have been on long-term maintenance treatment). SSRIs have been associated with a specific withdrawal syndrome (section 4.3.3).

Anxiety Management of *acute anxiety* in children with drug treatment is contentious (section 4.1.2). For *chronic anxiety* (of longer than 4 weeks' duration), it may be appropriate to use an antidepressant drug before a benzodiazepine.

4.3.1 Tricyclic antidepressant drugs

The safety and efficacy of tricyclic antidepressant drugs in the treatment of depression in children has not been established. Treatment should be managed by an appropriate specialist and should involve psychological therapy.

For reference to the role of some tricyclic antidepressant drugs in some forms of *neuralgia*, see section 4.7.3, and in *nocturnal enuresis* in children, see section 7.4.2.

Dosage It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment.

In most children the long half-life of tricyclic antidepressant drugs allows **once-daily** administration, usually at night; the use of modified-release preparations is therefore unnecessary.

Choice Tricyclic antidepressant drugs should generally be avoided for the treatment of depression in children (see above). Tricyclic and related antidepressant drugs block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine is more selective for serotonergic transmission, and imipramine is more selective for noradrenergic transmission. Tricyclic antidepressant drugs can be roughly divided into those with additional sedative properties and those without. Those with **sedative** properties include amitriptyline and doxepin. Those with **less sedative** properties include imipramine and nortriptyline.

Amitriptyline and **imipramine** have more marked antimuscarinic and cardiac side-effects than some other tricyclic or related antidepressant drugs, such as **doxepin**; this may be important in some children.

Side-effects *Arrhythmias* and *heart block* occasionally follow the use of tricyclic antidepressant drugs, particularly amitriptyline, and may be a factor in the sudden death of children with cardiac disease. They are also sometimes associated with *convulsions* (and should be prescribed with special caution in epilepsy as they lower the convulsive threshold).

Other side-effects of tricyclic antidepressant drugs include *drowsiness*, *dry mouth*, *blurred vision*, *constipation*, and *urinary retention* (all attributed to antimuscarinic activity), and sweating. The child should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Neuroleptic malignant syndrome (section 4.2.1) may, *very rarely*, arise in the course of antidepressant drug treatment.

Suicidal behaviour has been linked with antidepressant drugs (see p. 228).

Overdosage Limited quantities of tricyclic antidepressant drugs should be prescribed at any one time because their cardiovascular effects are dangerous in overdosage. In particular, overdosage with **amitriptyline** is associated with a relatively high rate of fatality. For advice on overdosage see Emergency Treatment of Poisoning, p. 40.

Withdrawal If possible tricyclic antidepressant drugs should be withdrawn slowly (see also section 4.3.1).

AMITRIPTYLINE HYDROCHLORIDE

Cautions cardiac disease (particularly with arrhythmias, see Contra-indications below), history of epilepsy, thyroid disease, pheochromocytoma, history of mania, psychoses (may aggravate psychotic symptoms), susceptibility to angle-closure glaucoma, history of urinary retention, concurrent electroconvulsive therapy; if possible avoid abrupt withdrawal; anaesthesia (increased risk of arrhythmias and hypotension, see surgery section 15.1); acute porphyria (section 9.8.2); see section 7.4.2 for additional nocturnal enuresis

warnings; **interactions:** Appendix 1 (antidepressants, tricyclic)

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Hepatic impairment sedative effects increased; avoid in severe hepatic impairment

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding amount too small to be harmful but manufacturer advises avoid

AMITRIPTYLINE HYDROCHLORIDE (continued)

Contra-indications arrhythmias (particularly heart block), not indicated in manic phase, severe liver disease

Side-effects dry mouth, sedation, blurred vision (disturbance of accommodation, increased intra-ocular pressure), constipation, nausea, difficulty with micturition; cardiovascular side-effects (such as ECG changes, arrhythmias, postural hypotension, tachycardia, syncope, particularly with high doses); sweating, tremor, rashes and hypersensitivity reactions (including urticaria, photosensitivity), behavioural disturbances, hypomania or mania, confusion or delirium, headache, interference with sexual function, blood—glucose changes; increased appetite and weight gain (occasionally weight loss); endocrine side-effects such as testicular enlargement, gynaecomastia, galactorrhoea; also convulsions (see also Cautions), movement disorders and dyskinesias, dysarthria, paraesthesia, taste disturbances, tinnitus, fever, agranulocytosis, leucopenia, eosinophilia, purpura, thrombocytopenia, hyponatraemia (see Hyponatraemia and Anti-depressant Therapy, p. 228), abnormal liver function tests (jaundice); for a general outline of side-effects see also notes above; **overdosage:** see Emergency Treatment of Poisoning, p. 40 (high rate of fatality—see Overdosage, p. 229)

Licensed use not licensed for use in neuropathic pain

Indication and dose

Depression (but see notes above)

- **By mouth**

Child 16–18 years 10–25 mg 3 times daily (total daily dose may alternatively be given as a single

dose at bedtime) increased gradually as necessary to 150–200 mg daily

Nocturnal enuresis

- **By mouth**

Child 6–11 years 10–20 mg at night

Child 11–16 years 25–50 mg at night

Note Max. period of treatment (including gradual withdrawal) 3 months—full physical examination before further course, see also section 7.4.2

Neuropathic pain in palliative care

- **By mouth**

Child 2–12 years initially 200–500 micrograms/kg (max. 25 mg) once daily at night, increased if necessary; max. 1 mg/kg twice daily on specialist advice

Child 12–18 years initially 10–25 mg once daily at night, increased gradually if necessary to usual dose 75 mg at night; higher doses on specialist advice

Amitriptyline (Non-proprietary) (PoM)

Tablets, coated, amitriptyline hydrochloride 10 mg, net price 28 = 97p; 25 mg, 28 = 97p; 50 mg, 28 = £1.12. Label: 2

Oral solution, amitriptyline hydrochloride 25 mg/5 mL, net price 150 mL = £13.30; 50 mg/5 mL, 150 mL = £14.48. Label: 2

DOXEPIN

Cautions see under Amitriptyline Hydrochloride

Contra-indications see under Amitriptyline Hydrochloride

Breast-feeding manufacturer advises avoid—accumulation of doxepin metabolite may cause sedation and respiratory depression

Side-effects see under Amitriptyline Hydrochloride

Indication and dose

Depressive illness, particularly where sedation is required (but see notes above)

- **By mouth**

Child 12–18 years initially 75 mg daily in divided doses or as a single dose at bedtime,

adjusted according to response; usual maintenance 30–300 mg daily (doses above 100 mg given in 3 divided doses)

Sinepin® (Marlborough) (PoM)

Capsules, doxepin (as hydrochloride) 25 mg, net price 28-cap pack = £3.77; 50 mg, 28-cap pack = £5.71. Label: 2

IMIPRAMINE HYDROCHLORIDE

Cautions see under Amitriptyline Hydrochloride

Pregnancy tachycardia, irritability, and muscle spasms reported in neonates when used in third trimester

Contra-indications see under Amitriptyline Hydrochloride

Side-effects see under Amitriptyline Hydrochloride, but less sedating

Licensed use not licensed for use for attention deficit hyperactivity disorder

◊ **IMIPRAMINE HYDROCHLORIDE** (*continued*)**Indication and dose****Nocturnal enuresis**

- By mouth

Child 6–8 years 25 mg at bedtime

Child 8–11 years 25–50 mg at bedtime

Child 11–18 years 50–75 mg at bedtime

Note Max. period of treatment (including gradual withdrawal) 3 months—full physical examination before further course, see also section 7.4.2

Attention deficit hyperactivity disorder (under specialist supervision)

- By mouth

Child 6–18 years 10–30 mg twice daily

Imipramine (Non-proprietary) (POM)

Tablets, coated, imipramine hydrochloride 10 mg, net price 28-tab pack = £1.20; 25 mg, 28-tab pack = £1.17. Label: 2

NORTRIPTYLINE

Cautions see under Amitriptyline Hydrochloride; manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily, but evidence of practical value uncertain

Contra-indications see under Amitriptyline Hydrochloride

Side-effects see under Amitriptyline Hydrochloride, but less sedating

Indication and dose

Depression (but see notes above)

- By mouth

Child 12–18 years low dose initially increased as necessary to 30–50 mg daily in divided doses or as a single dose (max. 150 mg daily)

Nocturnal enuresis

- By mouth

Child 6–8 years 10 mg at night

Child 8–11 years 10–20 mg at night

Child 11–18 years 25–35 mg at night

Note Max. period of treatment (including gradual withdrawal) 3 months—full physical examination and ECG before further course, see also section 7.4.2

Allegron[®] (King) (POM)

Tablets, nortriptyline (as hydrochloride) 10 mg, net price 100-tab pack = £12.06; 25 mg (orange, scored), 100-tab pack = £24.02. Label: 2

4.3.2 Monoamine-oxidase inhibitors

(MAOIs)

Classification not used in *BNF for Children*.

4.3.3 Selective serotonin re-uptake inhibitors

Citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, and sertraline selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT); they are termed selective serotonin re-uptake inhibitors (SSRIs).

CSM advice (depressive illness in children and adolescents)

The CSM has advised that the balance of risks and benefits for the treatment of depressive illness in individuals under 18 years is considered unfavourable for the SSRIs **citalopram, escitalopram, paroxetine, and sertraline**, and for **mirtazapine** and **venlafaxine**. Clinical trials have failed to show efficacy and have shown an increase in harmful outcomes. However, it is recognised that specialists may sometimes decide to use these drugs in response to individual clinical need; children and adolescents should be monitored carefully for suicidal behaviour, self-harm or hostility, particularly at the beginning of treatment. Only **fluoxetine** has been shown in clinical trials to be effective for treating depressive illness in children and adolescents. However, it is possible that, in common with the other SSRIs, it is associated with a small risk of self-harm and suicidal thoughts. Overall, the balance of risks and benefits for fluoxetine in the treatment of depressive illness in individuals under 18 years is considered favourable, but children and adolescents must be carefully monitored as above.

Cautions SSRIs should be used with caution in children with epilepsy (avoid if poorly controlled, discontinue if convulsions develop), cardiac disease, diabetes mellitus, susceptibility to angle-closure glaucoma, a history of mania or bleeding disorders (especially gastro-intestinal bleeding), and if used together with other drugs that increase the risk of bleeding. They should also be used with caution in those receiving concurrent electroconvulsive therapy (prolonged seizures

reported with fluoxetine). SSRIs may also impair performance of skilled tasks (e.g. driving). **Interactions:** Appendix 1 (antidepressants, SSRI).

Withdrawal Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; the dose should be tapered over a few weeks to avoid these effects.

Contra-indications SSRIs should not be used if the child enters a manic phase.

Side-effects SSRIs are less sedating and have fewer antimuscarinic and cardiotoxic effects than tricyclic antidepressant drugs (section 4.3.1). Side-effects of the SSRIs include gastro-intestinal effects (dose-related and fairly common—include nausea, vomiting, dyspepsia, abdominal pain, diarrhoea, constipation), anorexia with weight loss (increased appetite and weight gain also reported) and hypersensitivity reactions including rash (consider discontinuation—may be sign of impending serious systemic reaction, possibly associated with vasculitis), urticaria, angioedema, anaphylaxis, arthralgia, myalgia and photosensitivity; other side-effects include dry mouth, nervousness, anxiety, headache, insomnia, tremor, dizziness, asthenia, hallucinations, drowsiness, convulsions (see Cautions above), galactorrhoea, sexual dysfunction, urinary retention, sweating, hypomania or mania (see Cautions above), movement disorders and dyskinesias, visual disturbances, hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 228), and bleeding disorders including ecchymoses and purpura. Suicidal behaviour has been linked with antidepressants, see p. 228.

CITALOPRAM

Cautions see notes above

Hepatic impairment use doses at lower end of range

Renal impairment no information available for estimated glomerular filtration rate less than 20 mL/minute/1.73 m²

Pregnancy manufacturers advise use only if potential benefit outweighs risk; risk of neonatal withdrawal

Breast-feeding present in milk—manufacturer advises avoid

Contra-indications see notes above

Side-effects see notes above; also palpitation, tachycardia, postural hypotension, coughing, yawning, confusion, impaired concentration, malaise, amnesia, migraine, paraesthesia, abnormal dreams, taste disturbance, increased salivation, rhinitis, tinnitus, polyuria, micturition disorders, euphoria

Licensed use not licensed for use in children

Indication and dose

Major depression (but see CSM advice, above)

- By mouth as tablets

Child 12–18 years initially 10 mg once daily, increased if necessary to 20 mg once daily over 2–4 weeks; max. 60 mg once daily

- By mouth as oral drops

Child 12–18 years initially 8 mg once daily increased if necessary to 16 mg once daily over 2–4 weeks; max. 48 mg once daily

Citalopram (Non-proprietary) (P_{HM})

Tablets, citalopram (as hydrobromide) 10 mg, net price 28-tab pack = £1.08; 20 mg, 28-tab pack = £1.25; 40 mg, 28-tab pack = £1.46. Counselling, driving

Oral drops, citalopram (as hydrochloride) 40 mg/mL, net price 15-mL pack = £19.66. Counselling, driving, administration

Note 4 drops (8 mg) can be considered equivalent in therapeutic effect to 10-mg tablet

Mix with water, orange juice, or apple juice before taking

Cipramil[®] (Lundbeck) (P_{HM})

Tablets, f/c, citalopram (as hydrobromide) 10 mg, net price 28-tab pack = £8.97; 20 mg (scored), 28-tab pack = £14.91; 40 mg, 28-tab pack = £25.20. Counselling, driving

Oral drops, sugar-free, citalopram (as hydrochloride) 40 mg/mL, net price 15-mL pack = £20.16. Counselling, driving, administration

Note 4 drops (8 mg) can be considered equivalent in therapeutic effect to 10-mg tablet

Mix with water, orange juice, or apple juice before taking

FLUOXETINE

Cautions see notes above

Hepatic impairment reduce dose; avoid in severe hepatic impairment

Pregnancy manufacturer advises use only if potential benefit outweighs risk (no evidence of teratogenicity)

Breast-feeding present in breast milk, manufacturer advises avoid

Contra-indications see notes above

Side-effects see notes above; also vasodilatation, postural hypotension, pharyngitis, dyspnoea, chills, taste disturbances, sleep disturbances,

□ FLUOXETINE (continued)

euphoria, confusion, yawning, impaired concentration, changes in blood sugar, alopecia, urinary frequency; *rarely* pulmonary inflammation and fibrosis; *very rarely* hepatitis, toxic epidermal necrolysis, and neuroleptic malignant syndrome-like event

Indication and dose

Major depression

• By mouth

Child 8–18 years 10 mg once daily increased after 1–2 weeks if necessary, max. 20 mg once daily

Long duration of action Consider the long half-life of fluoxetine when adjusting dosage (or in overdose)

Fluoxetine (Non-proprietary) ^(POM)

Capsules, fluoxetine (as hydrochloride) 20 mg, net price 30-cap pack = £1.02; 60 mg, 30-cap pack = £55.76. Counselling, driving
Brands include *Oxactin*®

Liquid, fluoxetine (as hydrochloride) 20 mg/5 mL, net price 70 mL = £7.41. Counselling, driving
Brands include *Prozep*®

Prozac® (Lilly) ^(POM)

Capsules, fluoxetine (as hydrochloride) 20 mg (green/yellow), net price 30-cap pack = £14.21. Counselling, driving

Liquid, fluoxetine (as hydrochloride) 20 mg/5 mL, net price 70 mL = £13.26. Counselling, driving

FLUVOXAMINE MALEATE

Cautions see notes above

Hepatic impairment reduce dose

Renal impairment start with smaller dose

Pregnancy manufacturers advise use only if potential benefit outweighs risk; risk of neonatal withdrawal

Breast-feeding present in milk—manufacturer advises avoid

CSM advice The CSM has advised that concomitant use of fluvoxamine and theophylline or aminophylline should usually be avoided; see also **interactions**: Appendix 1 (antidepressants, SSRIs)

Contra-indications see notes above

Side-effects see notes above; palpitation, tachycardia (may also cause bradycardia); *rarely* postural hypotension, confusion, ataxia, paraesthesia, malaise, taste disturbance, neuroleptic malignant syndrome-like event, abnormal liver function tests, usually symptomatic (discontinue treatment)

Indication and dose

Obsessive-compulsive disorder

• By mouth

Child 8–18 years initially 25 mg daily increased if necessary in steps of 25 mg every 4–7 days according to response (total daily doses above 50 mg in 2 divided doses); max. 100 mg twice daily

Note If no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

Fluvoxamine (Non-proprietary) ^(POM)

Tablets, fluvoxamine maleate 50 mg, net price 60-tab pack = £6.80; 100 mg, 30-tab pack = £8.34. Counselling, driving

Faverin® (Solvay) ^(POM)

Tablets, f/c, scored, fluvoxamine maleate 50 mg, net price 60-tab pack = £17.10; 100 mg, 30-tab pack = £17.10. Counselling, driving

SERTRALINE

Cautions see notes above; renal impairment

Hepatic impairment reduce dose in mild or moderate hepatic impairment; avoid in severe impairment

Pregnancy manufacturers advise use only if potential benefit outweighs risk; risk of neonatal withdrawal

Breast-feeding present in milk but not known to be harmful in short-term use

Contra-indications see notes above

Side-effects see notes above; pancreatitis, hepatitis, jaundice, liver failure, tachycardia, postural hypotension, amnesia, paraesthesia, aggression, urinary incontinence, and menstrual irregularities also reported

Licensed use not licensed for use in children for depression

Indication and dose

Obsessive-compulsive disorder

• By mouth

Child 6–12 years initially 25 mg daily increased to 50 mg daily after 1 week, further increased if

necessary in steps of 50 mg at intervals of at least 1 week; max. 200 mg daily

Child 12–18 years initially 50 mg daily increased if necessary in steps of 50 mg over several weeks; usual range 50–200 mg daily

Major depression (but see CSM advice, above)

• By mouth

Child 12–18 years initially 50 mg once daily increased if necessary in steps of 50 mg daily at intervals of at least a week; max. 200 mg once daily

Sertraline (Non-proprietary) ^(POM)

Tablets, sertraline (as hydrochloride) 50 mg, net price 28-tab pack = £1.37; 100 mg, 28-tab pack = £1.80. Counselling, driving

Lustral® (Pfizer) ^(POM)

Tablets, both f/c, sertraline (as hydrochloride) 50 mg (scored), net price 28-tab pack = £17.82; 100 mg, 28-tab pack = £29.16. Counselling, driving

4.3.4 Other antidepressant drugs

Classification not used in *BNF for Children*.

4.4 CNS stimulants and other drugs for attention deficit hyperactivity disorder

CNS stimulants should only be prescribed for children with severe and persistent symptoms of *attention deficit hyperactivity disorder* (ADHD), when the diagnosis has been confirmed by a specialist; treatment may be continued by general practitioners under a shared-care arrangement. Treatment often needs to be continued into adolescence, and may need to be continued into adulthood.

Drug treatment of ADHD should be part of a comprehensive treatment programme. The choice of drug should take into consideration co-morbid conditions (such as tic disorders, Tourette syndrome, and epilepsy), different adverse effects of the drugs, potential for drug misuse, and preferences of the child and carers.

Methylphenidate and **atomoxetine** are used for the management of ADHD; **dexamfetamine** (dexamphetamine) is an alternative in children who do not respond to these drugs. Growth is not generally affected by treatment with CNS stimulants but it is advisable to monitor growth during treatment.

A tricyclic antidepressant such as **imipramine** (section 4.3.1) is sometimes used in the treatment of ADHD; it should not be prescribed concomitantly with a CNS stimulant.

Modafinil is used for the treatment of daytime sleepiness associated with narcolepsy; dependence with long-term use cannot be excluded and it should therefore be used with caution.

Dexamfetamine and methylphenidate [both unlicensed] are also used to treat narcolepsy.

ATOMOXETINE

Cautions cardiovascular disease including hypertension and tachycardia; monitor growth; QT-interval prolongation (avoid concomitant administration of drugs that prolong QT-interval); history of seizures; susceptibility to angle-closure glaucoma; **interactions:** Appendix 1 (atomoxetine)

Hepatic disorders Following rare reports of hepatic disorders, the CSM has advised that children and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine or jaundice

Suicidal ideation Following reports of suicidal thoughts and behaviour, CSM has advised that children and carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression

Hepatic impairment see hepatic disorders above; also halve dose in moderate liver disease; quarter dose in severe liver disease

Pregnancy no information available; manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects anorexia, dry mouth, nausea, vomiting, abdominal pain, constipation, dyspepsia, flatulence; palpitation, tachycardia, increased blood pressure, postural hypotension, hot flushes; sleep disturbance, dizziness, headache, fatigue, lethargy, depression, anxiety, irritability, tremor, rigors; urinary retention, prostatitis, sexual dysfunction, menstrual disturbances; mydriasis, conjunctivitis; dermatitis, pruritus, rash, sweating; *less commonly* suicidal ideation

(see Suicidal Ideation, above), cold extremities; *very rarely* hepatic disorders (see Hepatic Disorders, above), seizures, Raynaud's phenomenon, and angle-closure glaucoma

Indication and dose

Attention deficit hyperactivity disorder initiated by specialist

• By mouth

Child over 6 years (body-weight under 70 kg) initially 500 micrograms/kg daily for 7 days then increased according to response to usual maintenance dose 1.2 mg/kg daily; usual max. 100 mg daily, but may be increased to 1.8 mg/kg (max. 120 mg) daily under the direction of a specialist

Child (body-weight over 70 kg) initially 40 mg daily for 7 days then increased according to response to usual maintenance dose 80 mg daily; usual max. 100 mg daily, but may be increased to max. 120 mg daily under the direction of a specialist

Note Total daily dose may be given *either* as a single dose in the morning *or* in 2 divided doses with last dose no later than early evening

Strattera® (Lilly) ▼ (POM)

Capsules, atomoxetine (as hydrochloride) 10 mg (white), net price 7-cap pack = £15.02, 28-cap pack = £60.06; 18 mg (gold/white), 7-cap pack = £15.02, 28-cap pack = £60.06; 25 mg (blue/white), 7-cap pack = £15.02, 28-cap pack = £60.06; 40 mg (blue), 7-cap pack = £15.02, 28-cap pack = £60.06; 60 mg (blue/gold), 28-cap pack = £60.06. Label: 3

DEXAMFETAMINE SULPHATE

(Dexamphetamine sulphate)

Cautions mild hypertension (contra-indicated if moderate or severe)—monitor blood pressure; history of epilepsy (discontinue if convulsions occur); tics and Tourette syndrome (use with caution)—discontinue if tics occur; monitor growth (see also below); avoid abrupt withdrawal; data on safety and efficacy of long-term use not complete; acute porphyria (see section 9.8.2); **interactions:** Appendix 1 (sympathomimetics) **Growth restriction** Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

Contra-indications cardiovascular disease including moderate to severe hypertension, hyperexcitability or agitated states, hyperthyroidism, history of drug or alcohol abuse, glaucoma

Skilled tasks May affect performance of skilled tasks (e.g. driving); effects of alcohol unpredictable

Pregnancy manufacturer advises avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity)

Breast-feeding significant amount in milk—avoid

Side-effects insomnia, restlessness, irritability and excitability, nervousness, night terrors, euphoria, tremor, dizziness, headache; convulsions (see also Cautions); dependence and tolerance, sometimes psychosis; anorexia, gas-

tro-intestinal symptoms, growth restriction (see also under Cautions); dry mouth, sweating, tachycardia (and anginal pain), palpitation, increased blood pressure; visual disturbances; cardiomyopathy reported with chronic use; central stimulants have provoked choreoathetoid movements, tics and Tourette syndrome in predisposed individuals (see also Cautions above); **overdose:** see Emergency Treatment of Poisoning, p. 43

Indication and dose

Refractory attention deficit hyperactivity disorder initiated by specialist

• **By mouth**

Child 4–6 years initially 2.5 mg once daily, increased if necessary by 2.5 mg at intervals of 1 week; usual max. 20 mg daily; maintenance dose given in 2–3 divided doses

Child 6–18 years initially 5–10 mg once daily, increased if necessary by 5 mg at intervals of 1 week; usual max. 20 mg daily (older children have received max. 40 mg); maintenance dose given in 2–3 divided doses

Administration tablets can be halved

Dexedrine® (UCB Pharma) 

Tablets, scored, dexamfetamine sulphate 5 mg. Net price 28-tab pack = £3.00. Counselling, driving

METHYLPHENIDATE HYDROCHLORIDE

Cautions monitor growth (if prolonged treatment), blood pressure and full blood count; anxiety or agitation; tics or a family history of Tourette syndrome; epilepsy (discontinue if increased seizure frequency); avoid abrupt withdrawal; **interactions:** Appendix 1 (sympathomimetics)

Pregnancy limited experience—manufacturer advises avoid unless potential benefit outweighs risk; toxicity in *animals*

Contra-indications severe depression, suicidal ideation; drug or alcohol dependence, psychosis; hyperthyroidism; cardiovascular disease

Breast-feeding no information available—manufacturer advises avoid

Side-effects abdominal pain, nausea, vomiting, dyspepsia, dry mouth; anorexia, reduced weight gain; tachycardia, palpitation, arrhythmias, changes in blood pressure; tics (*very rarely* Tourette syndrome), insomnia, nervousness, asthenia, depression, irritability, aggression, headache, drowsiness, dizziness, movement disorders; fever, arthralgia; rash, pruritus, alopecia; *less commonly* diarrhoea, abnormal dreams, confusion, suicidal ideation, urinary frequency, haematuria, muscle cramps, epistaxis; *rarely* growth restriction, visual disturbances; *very rarely* hepatic dysfunction, cerebral arteritis, psychosis, seizures, neuroleptic malignant syndrome, tolerance and dependence, blood disorders including leucopenia and thrombocytopenia, exfoliative dermatitis, and erythema multiforme

Licensed use not licensed for use in children under 6 years

Indication and dose

Attention deficit hyperactivity disorder initiated by specialist

• **By mouth**

Child 4–6 years 2.5 mg twice daily increased if necessary at weekly intervals by 2.5 mg daily to max. 1.4 mg/kg daily in divided doses; discontinue if no response after 1 month, suspend treatment every 1–2 years to assess condition

Child 6–18 years initially 5 mg 1–2 times daily, increased if necessary at weekly intervals by 5–10 mg daily; usual max. 60 mg daily in divided doses but may be increased to 2.1 mg/kg daily (max. 90 mg daily) under the direction of a specialist; discontinue if no response after 1 month, suspend treatment every 1–2 years to assess condition

Evening dose If effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose)

Note Treatment may be started using a modified-release preparation

Administration *Equasym®* and *Ritalin®* tablets may be halved; contents of *Equasym XL®* capsules can be sprinkled on a tablespoon of apple sauce, then swallowed immediately without chewing

▢ METHYLPHENIDATE HYDROCHLORIDE (continued)

Methylphenidate Hydrochloride (Non-proprietary) CD

Tablets, methylphenidate hydrochloride 5 mg, net price 30-tab pack = £2.78; 10 mg, 30-tab pack = £5.80; 20 mg, 30-tab pack = £9.98
Brands include *Equasym*[®], *Medikinet*[®]

Ritalin[®] (Novartis) CD

Tablets, scored, methylphenidate hydrochloride 10 mg, net price 30-tab pack = £5.57

▣ Modified release

Concerta[®] XL (Janssen-Cilag) CD

Tablets, m/r, methylphenidate hydrochloride 18 mg (yellow), net price 30-tab pack = £29.70; 27 mg (grey), 30-tab pack = £35.06; 36 mg (white), 30-tab pack = £40.43. Label: 25

Counselling Tablet membrane may pass through gastro-intestinal tract unchanged

Cautions dose form not appropriate for use in dysphagia or if gastro-intestinal lumen restricted

Dose

• By mouth

Child 6–18 years initially 18 mg once daily (in the morning), increased if necessary in weekly steps of 18 mg according to response; usual max. 54 mg once daily, but may be increased to 2.1 mg/kg daily (max. 108 mg daily) under the direction of a specialist; discontinue if no response after 1 month; suspend treatment every 1–2 years to assess condition

Note Total daily dose of 15 mg of standard-release formulation is considered equivalent to *Concerta*[®] XL 18 mg once daily

Equasym XL[®] (UCB Pharma) CD

Capsules, m/r, methylphenidate hydrochloride 10 mg (white/green), net price 30-cap pack = £25.00; 20 mg (white/blue), 30-cap pack = £30.00; 30 mg (white/brown), 30-cap pack = £35.00.
Label: 25

Dose

• By mouth

Child 6–18 years initially 10 mg once daily in the morning before breakfast, increased gradually if necessary; usual max. 60 mg daily, but may be increased to 2.1 mg/kg daily (max. 90 mg daily) under the direction of a specialist; discontinue if no response after 1 month; suspend treatment every 1–2 years to assess condition

Medikinet XL[®] (Flynn) CD

Capsules, m/r, methylphenidate hydrochloride 10 mg (lilac/white), net price 28-cap pack = £21.00; 20 mg (lilac), 28-cap pack = £28.00; 30 mg (purple/light grey), 28-cap pack = £33.72; 40 mg (purple/grey), 28-cap pack = £44.95. Label: 25

Dose

• By mouth

Child 6–18 years 10 mg once daily in the morning with breakfast, adjusted according to response; usual max. 60 mg daily, but may be increased to 2.1 mg/kg daily (max. 90 mg daily) under the direction of a specialist; discontinue if no response after 1 month; suspend treatment every 1–2 years to assess condition

Note Contents of capsule can be sprinkled on a table-spoon of apple sauce (then swallowed immediately without chewing)

MODAFINIL

Cautions monitor blood pressure and heart rate in hypertension (see Contra-indications); possibility of dependence; **interactions:** Appendix 1 (modafinil)

Hepatic impairment halve dose in severe liver disease

Renal impairment manufacturer advises use half normal dose in severe impairment

Contra-indications moderate to severe uncontrolled hypertension, arrhythmia; history of left ventricular hypertrophy, of cor pulmonale, or of clinically significant stimulant-induced mitral-valve prolapse (including ischaemic ECG changes, chest pain and arrhythmias)

Pregnancy manufacturer advises avoid

Breast-feeding manufacturer advises avoid—no information available

Side-effects dry mouth, appetite changes, gastro-intestinal disturbances (including nausea, diarrhoea, constipation, and dyspepsia), abdominal pain; tachycardia, vasodilation, chest pain, palpitation; headache (uncommonly migraine), anxiety, sleep disturbances, dizziness, depression, confusion, paraesthesia, asthenia; visual disturbances; *less commonly* mouth ulcers, glossitis, pharyngitis, dysphagia, taste disturbance, increased thirst, hypertension, hypotension, bradycardia, arrhythmia, peripheral oedema, hypercholesterolaemia, rhinitis, dyspnoea, agita-

tion, dyskinesia, amnesia, emotional lability, abnormal dreams, tremor, decreased libido, weight changes, hyperglycaemia, urinary frequency, menstrual disturbances, eosinophilia, leucopenia, myasthenia, muscle cramps, dry eye, sinusitis, epistaxis, myalgia, arthralgia, acne, sweating, rash, and pruritus; *very rarely* psychosis, mania, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Licensed use not licensed for use in children under 12 years

Indication and dose

Narcolepsy

• By mouth

Child 5–12 years initially 100 mg daily in the morning, dose adjusted according to response to 100–400 mg daily *either* in 2 divided doses morning and at noon *or* as a single dose in the morning

Child 12–18 years 200 mg daily, *either* in 2 divided doses morning and at noon *or* as a single dose in the morning, dose adjusted according to response to 200–400 mg daily in 2 divided doses *or* as a single dose

Provigil[®] (Cephalon) ▼ PMI

Tablets, modafinil 100 mg, net price 30-tab pack = £55.80; 200 mg, 30-tab pack = £111.60

4.5 Drugs used in the treatment of obesity

Obesity is associated with many health problems including cardiovascular disease, diabetes mellitus, gallstones, and osteoarthritis. Factors that aggravate obesity may include depression, other psychosocial problems, and some drugs.

The main treatment of the obese individual is a suitable diet, carefully explained to the individual or carer, with appropriate support and encouragement; increased physical activity should also be encouraged. If appropriate, smoking cessation (while maintaining body weight) may be worthwhile before attempting supervised weight loss, since cigarette smoking may be more harmful than obesity.

Obesity should be managed in an appropriate setting by staff who have been trained in the management of obesity in children; the individual or carer should receive advice on diet and lifestyle modification and should be monitored for changes in weight as well as in blood pressure, blood lipids, and other associated conditions.

NICE has recommended (December 2006) that drug treatment should only be considered for obese children after dietary, exercise, and behavioural approaches have been started, and who have associated conditions such as orthopaedic problems or sleep apnoea; treatment is intended both to facilitate weight loss and to maintain reduced weight. Initial treatment should involve a 6–12 month trial of orlistat or sibutramine, with regular reviews of effectiveness, tolerance, and adherence.

Choice **Orlistat**, a lipase inhibitor, reduces the absorption of dietary fat. Some weight loss in those taking orlistat probably results from a reduction in fat intake to avoid severe gastro-intestinal effects including steatorrhoea. Vitamin supplementation (especially of vitamin D) may be considered if there is concern about deficiency of fat-soluble vitamins.

Sibutramine is a centrally acting appetite suppressant that inhibits the re-uptake of noradrenaline and serotonin.

There is little evidence to guide selection between orlistat and sibutramine, but it may be appropriate to choose orlistat for those who have a high intake of fat whereas sibutramine may be chosen for those who cannot control their eating; the cautions, contra-indications and side-effects of the two drugs should also be considered. On stopping treatment with orlistat or sibutramine there may be a gradual reversal of weight loss.

Combination therapy involving more than one anti-obesity drug should not be used until further information about efficacy and long-term safety is available.

Thyroid hormones have no place in the treatment of obesity except in biochemically proven hypothyroid children. The use of diuretics, chorionic gonadotrophin, or amphetamines is not appropriate for weight reduction.

4.6 Drugs used in nausea and vertigo

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

Antihistamines are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The **phenothiazines** are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They may be considered for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics. **Prochlorperazine**, **perphenazine**, and **trifluoperazine** are less sedating than **chlorpromazine**; severe dystonic reactions sometimes occur with phenothiazines (see below). Other antipsychotic drugs including

haloperidol and **levomepromazine** (methotrimeprazine) (section 4.2.1) are also used for the relief of nausea in palliative care (see p.27 and p.28). Some phenothiazines are available as rectal suppositories, which can be useful in children with persistent vomiting or with severe nausea; for children over 12 years prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Metoclopramide is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastro-duodenal, hepatic, and biliary disease. In postoperative nausea and vomiting, metoclopramide has limited efficacy. For the role of metoclopramide in cytotoxic-induced nausea and vomiting see section 8.1.

Acute dystonic reactions

Phenothiazines and metoclopramide can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible. With metoclopramide, dystonic effects usually occur shortly after starting treatment and subside within 24 hours of stopping it. An antimuscarinic drug such as procyclidine (section 4.9.2) is used to abort dystonic attacks.

Domperidone acts at the chemoreceptor trigger zone; it has the advantage over metoclopramide and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. For the role of domperidone in cytotoxic-induced nausea and vomiting see section 8.1. Domperidone is also used to treat vomiting due to emergency hormonal contraception (section 7.3.5).

Granisetron and **ondansetron** are specific 5HT₃ antagonists which block 5HT₃ receptors in the gastro-intestinal tract and in the CNS. They are of value in the management of nausea and vomiting in children receiving cytotoxics and in postoperative nausea and vomiting.

Nabilone is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics. Side-effects such as drowsiness and dizziness occur frequently with standard doses.

Dexamethasone (section 6.3.2) has antiemetic effects. For the role of dexamethasone in cytotoxic-induced nausea and vomiting see section 8.1.

Vomiting during pregnancy

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as **promethazine**, may be required. **Prochlorperazine** or **metoclopramide** may be considered as second-line treatments. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine must be considered in order to reduce the risk of Wernicke's encephalopathy.

Postoperative nausea and vomiting

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. The aim is to prevent postoperative nausea and vomiting from occurring. Drugs used include some **phenothiazines** (e.g. prochlorperazine), **metoclopramide**, **5HT₃ antagonists**, **antihistamines** (such as cyclizine), and **dexamethasone**. A combination of two antiemetic drugs acting at different sites may be needed in resistant postoperative nausea and vomiting.

Opioid-induced nausea and vomiting

Cyclizine, ondansetron, and prochlorperazine are used to relieve opioid-induced nausea and vomiting; ondansetron has the advantage of not producing sedation.

Motion sickness

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is **hyoscine hydrobromide**. For children over 10 years old, a transdermal hyoscine patch provides prolonged activity but it needs to be applied several hours before travelling. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired **promethazine** is useful, but generally a slightly less sedating antihistamine such as **cyclizine** or **cinnarizine** is preferred. The 5HT₃ antagonists, domperidone, metoclopramide, and the phenothiazines (except the antihistamine phenothiazine promethazine) are **ineffective** in motion sickness.

Other vestibular disorders

Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting.

Antihistamines (such as cinnarizine), and **phenothiazines** (such as prochlorperazine) are effective for prophylaxis and treatment of nausea and vertigo resulting from vestibular disorders; however, when nausea and vertigo are associated with middle ear surgery, treatment can be difficult.

Cytotoxic chemotherapy

For the management of nausea and vomiting induced by cytotoxic chemotherapy, see section 8.1.

Palliative care

For the management of nausea and vomiting in palliative care, see p. 27 and p. 28.

Migraine

For the management of nausea and vomiting associated with migraine, see p. 263.

Antihistamines

CINNARIZINE

Cautions see section 3.4.1

Hepatic impairment sedation inappropriate in severe liver disease—avoid

Pregnancy manufacturer advises avoid

Breast-feeding although not known to be harmful, manufacturer advises avoid

Contra-indications see section 3.4.1

Side-effects see section 3.4.1; also *rarely* weight gain, sweating, lichen planus, and lupus-like skin reactions

Indication and dose

Relief of symptoms of vestibular disorders

- By mouth

Child 5–12 years 15 mg 3 times daily

Child 12–18 years 30 mg 3 times daily

Motion sickness

- By mouth

Child 5–12 years 15 mg 2 hours before travel then 7.5 mg every 8 hours during journey if necessary

Child 12–18 years 30 mg 2 hours before travel then 15 mg every 8 hours during journey if necessary

Cinnarizine (Non-proprietary)

Tablets, scored, cinnarizine 15 mg, net price 84-tab pack = £15.91. Label: 2

Stugeron® (Janssen-Cilag)

Tablets, scored, cinnarizine 15 mg, net price 15-tab pack = £1.48, 100-tab pack = £3.49. Label: 2

CYCLIZINE

Cautions see section 3.4.1; severe heart failure; may counteract haemodynamic benefits of opioids; **interactions:** Appendix 1 (antihistamines)

Hepatic impairment sedation inappropriate in severe liver disease—avoid

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications see section 3.4.1

Side-effects see section 3.4.1

Licensed use tablets not licensed for use in children under 6 years; injection not licensed for use in children

□ CYCLIZINE (continued)

Indication and dose

Nausea and vomiting of known cause; nausea and vomiting associated with vestibular disorders and palliative care

- By mouth or by intravenous injection over 3–5 minutes

Child 1 month–6 years 0.5–1 mg/kg up to 3 times daily; max. single dose 25 mg

Child 6–12 years 25 mg up to 3 times daily

Child 12–18 years 50 mg up to 3 times daily

- By rectum

Child 2–6 years 12.5 mg up to 3 times daily

Child 6–12 years 25 mg up to 3 times daily

Child 12–18 years 50 mg up to 3 times daily

- By continuous intravenous or subcutaneous infusion

Child 1 month–2 years 3 mg/kg over 24 hours

Child 2–5 years 50 mg over 24 hours

Child 6–12 years 75 mg over 24 hours

Child 12–18 years 150 mg over 24 hours

Administration for administration *by mouth*, tablets may be crushed

Valoid® (Amdipharm)

Tablets, scored, cyclizine hydrochloride 50 mg. Net price 100 = £7.41. Label: 2

Injection ^[POM], cyclizine lactate 50 mg/mL. Net price 1-mL amp = 49p

Cyclizine (Non-proprietary)

Suppositories, 12.5 mg, 25 mg, 50 mg, 100 mg.

Available from 'special-order' manufacturers or specialist importing companies, see p. 943

PROMETHAZINE HYDROCHLORIDE

Cautions see section 3.4.1

Contra-indications see section 3.4.1

Side-effects see section 3.4.1 but more sedating

Indication and dose

Nausea and vomiting

- By mouth

Child 2–5 years 5 mg at bedtime on night before travel, repeat following morning if necessary

Child 5–10 years 10 mg at bedtime on night before travel, repeat following morning if necessary

Child 10–18 years 20–25 mg at bedtime on night before travel, repeat following morning if necessary

Allergy and urticaria section 3.4.1

Sedation section 4.1.1

■ Preparations

Section 3.4.1

PROMETHAZINE TEOCLATE

Cautions see section 3.4.1

Contra-indications see section 3.4.1

Side-effects see section 3.4.1

Licensed use not licensed to treat vomiting of pregnancy

Indication and dose

Nausea, vomiting, labyrinthine disorders

- By mouth

Child 5–10 years 12.5–37.5 mg daily

Child 10–18 years 25–75 mg daily (max. 100 mg)

Child 10–18 years 25 mg at bedtime on night before travel *or* 25 mg 1–2 hours before travel

Severe vomiting during pregnancy

- By mouth

25 mg at bedtime increased if necessary to max. 100 mg daily (but see also Vomiting During Pregnancy, p. 238)

Avomine® (Manx)

Tablets, scored, promethazine teoclate 25 mg. Net price 10-tab pack = £1.13; 28-tab pack = £3.13. Label: 2

Motion sickness prevention

- By mouth

Child 5–10 years 12.5 mg at bedtime on night before travel *or* 12.5 mg 1–2 hours before travel

Phenothiazines and related drugs

CHLORPROMAZINE HYDROCHLORIDE

Cautions see Chlorpromazine Hydrochloride, section 4.2.1

Contra-indications see Chlorpromazine Hydrochloride, section 4.2.1

Side-effects see Chlorpromazine Hydrochloride, section 4.2.1

Indication and dose

Nausea and vomiting of terminal illness (where other drugs are unsuitable)

- By mouth

Child 1–6 years 500 micrograms/kg every 4–6 hours; max. 40 mg daily

Child 6–12 years 500 micrograms/kg every 4–6 hours; max. 75 mg daily

Child 12–18 years 10–25 mg every 4–6 hours

- By deep intramuscular injection

Child 1–6 years 500 micrograms/kg every 6–8 hours; max. 40 mg daily

Child 6–12 years 500 micrograms/kg every 6–8 hours; max. 75 mg daily

Child 12–18 years initially 25 mg then 25–50 mg every 3–4 hours until vomiting stops

- Preparations

Section 4.2.1

PERPHENAZINE

Cautions see Perphenazine, section 4.2.1

Contra-indications see Perphenazine, section 4.2.1

Side-effects see Perphenazine, section 4.2.1; extrapyramidal symptoms

Indication and dose

Severe nausea and vomiting unresponsive to other antiemetics

- By mouth

Child 14–18 years 4 mg 3 times daily, adjusted according to response, max. 24 mg daily

- Preparations

Section 4.2.1

PROCHLORPERAZINE

Cautions see Prochlorperazine, section 4.2.1; hypotension more likely after intramuscular injection

Contra-indications see Prochlorperazine, section 4.2.1

Side-effects see Prochlorperazine, section 4.2.1; extrapyramidal symptoms, particularly dystonias, more frequent; respiratory depression may occur in susceptible children

Licensed use injection not licensed for use in children

Indication and dose

Prevention and treatment of nausea and vomiting

- By mouth

Child 1–12 years and over 10 kg 250 micrograms/kg 2–3 times daily

Child 12–18 years 5–10 mg, repeated if necessary up to 3 times daily

- By intramuscular injection

Child 2–5 years, 1.25–2.5 mg, repeated if necessary up to 3 times daily

Child 5–12 years 5–6.25 mg, repeated if necessary up to 3 times daily

Child 12–18 years 12.5 mg, repeated if necessary up to 3 times daily

Note Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate

Prochlorperazine (Non-proprietary) (POM)

Tablets, prochlorperazine maleate 5 mg, net price 28 = £2.09, 84 = £4.14. Label: 2

Stemetil[®] (Castlemead) (POM)

Tablets, prochlorperazine maleate 5 mg (off-white), net price 84-tab pack = £6.18. Label: 2

Syrup, straw-coloured, prochlorperazine mesilate 5 mg/5 mL. Net price 100-mL pack = £3.48. Label: 2

Injection, prochlorperazine mesilate 12.5 mg/mL. Net price 1-mL amp = 54p

- Buccal preparation

Buccastem[®] (R&C) (POM)

Tablets (buccal), pale yellow, prochlorperazine maleate 3 mg. Net price 5 × 10-tab pack = £5.75. Label: 2, counselling, administration, see under Dose below

Dose

- By mouth

Child 12–18 years 1–2 tablets twice daily; tablets are placed high between upper lip and gum and left to dissolve

TRIFLUOPERAZINE

Cautions see Trifluoperazine section 4.2.1

Contra-indications see Trifluoperazine section 4.2.1

Side-effects see Trifluoperazine section 4.2.1; extrapyramidal symptoms

Indication and dose

Severe nausea and vomiting unresponsive to other antiemetics

- By mouth

Child 3–5 years up to 500 micrograms twice daily

Child 6–12 years up to 2 mg twice daily

Child 12–18 years 1–2 mg twice daily; max. 3 mg twice daily

■ **Preparations**

Section 4.2.1

Domperidone and metoclopramide

DOMPERIDONE

Cautions children; interactions: Appendix 1 (domperidone)

Renal impairment manufacturer advises reduce dose in renal impairment

Breast-feeding amount probably too small to be harmful

Contra-indications prolactinaemia; where increased gastro-intestinal motility harmful

Hepatic impairment avoid

Pregnancy manufacturer advises avoid

Side-effects rarely gastro-intestinal disturbances (including cramps), and hyperprolactinaemia; very rarely extrapyramidal effects and rashes

Indication and dose

Nausea and vomiting

- By mouth

Child over 1 month and body-weight up to 35 kg 250–500 micrograms/kg 3–4 times daily; max. 2.4 mg/kg in 24 hours

Body-weight 35 kg and over 10–20 mg 3–4 times daily, max. 80 mg daily

- By rectum

Body-weight 15–35 kg 30 mg twice daily

Body-weight over 35 kg 60 mg twice daily

Gastro-intestinal stasis section 1.2

Domperidone (Non-proprietary) ^(PoM)

Tablets, 10 mg (as maleate), net price 30-tab pack = £1.37; 100-tab pack = £2.55

Suspension, domperidone 5 mg/mL, net price 200-mL pack = £7.00

Motilium[®] (Winthrop) ^(PoM)

Tablets, f/c, domperidone 10 mg (as maleate), net price 30-tab pack = £2.82; 100-tab pack = £9.41

Suspension, sugar-free, domperidone 5 mg/5 mL, net price 200-mL pack = £2.16

Suppositories, domperidone 30 mg, net price 10 = £3.18

METOCLOPRAMIDE HYDROCHLORIDE

Cautions atopic allergy (including asthma); may mask underlying disorders such as cerebral irritation; epilepsy; acute porphyria (section 9.8.2); interactions: Appendix 1 (metoclopramide)

Hepatic impairment reduce dose

Renal impairment avoid or use small dose; increased risk of extrapyramidal reactions in severe impairment

Pregnancy not known to be harmful but manufacturer advises use only when compelling reasons

Contra-indications gastro-intestinal obstruction, perforation or haemorrhage; 3–4 days after gastro-intestinal surgery; phaeochromocytoma

Breast-feeding small amount present in milk; manufacturer advises avoid large single doses

Side-effects extrapyramidal effects (see p. 238), hyperprolactinaemia, occasionally tardive dyskinesia on prolonged administration; also reported, anxiety, confusion, drowsiness, restlessness, diarrhoea, depression, neuroleptic

malignant syndrome, rashes, pruritus, oedema; cardiac conduction abnormalities reported following intravenous administration; rarely methaemoglobinaemia (more severe in G6PD deficiency)

Licensed use not licensed for use in neonates as a prokinetic

Indication and dose

Severe intractable vomiting of known cause, vomiting associated with radiotherapy and cytotoxics, aid to gastro-intestinal intubation, as a prokinetic in neonates

- By mouth, or by intramuscular injection or by intravenous injection over 1–2 minutes

Neonate 100 micrograms/kg every 6–8 hours (by mouth or by intravenous injection only)

Child 1 month–1 year and body-weight up to 10 kg 100 micrograms/kg (max. 1 mg) twice daily

▣ METOCLOPRAMIDE HYDROCHLORIDE (continued)

Child 1–3 years and body-weight 10–14 kg
1 mg 2–3 times daily

Child 3–5 years and body-weight 15–19 kg
2 mg 2–3 times daily

Child 5–9 years and body-weight 20–29 kg
2.5 mg 3 times daily

Child 9–18 years and body-weight 30–60 kg
5 mg 3 times daily

Child 15–18 years and body-weight over 60 kg
10 mg 3 times daily

Note Daily dose of metoclopramide should not normally exceed 500 micrograms/kg

Premedication in diagnostic procedures

- By mouth as a single dose 5–10 minutes before examination

Child 1 month–3 years and body-weight up to 14 kg 100 micrograms/kg, max. 1 mg

Child 3–5 years and body-weight 15–19 kg
2 mg

Child 5–9 years and body-weight 20–29 kg
2.5 mg

Child 9–15 years and body-weight 30–60 kg
5 mg

Child 15–18 years and body-weight over 60 kg
10 mg

Metoclopramide (Non-proprietary) ^(POM)

Tablets, metoclopramide hydrochloride 10 mg, net price 28-tab pack = 90p

Oral solution, metoclopramide hydrochloride 5 mg/5 mL, net price 100-mL pack = £3.83. Counselling, use of pipette

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Injection, metoclopramide hydrochloride 5 mg/mL, net price 2-mL amp = 26p

Maxolon® (Amdipham) ^(POM)

Tablets, scored, metoclopramide hydrochloride 10 mg, net price 84-tab pack = £5.25

Syrup, sugar-free, metoclopramide hydrochloride 5 mg/5 mL. Net price 200-mL pack = £3.83

Paediatric liquid, sugar-free, metoclopramide hydrochloride 1 mg/mL. Net price 15-mL pack with pipette = £1.51. Counselling, use of pipette

Injection, metoclopramide hydrochloride 5 mg/mL. Net price 2-mL amp = 27p

▀ Compound preparations (for migraine)

Section 4.7.4.1

5HT₃ antagonists

GRANISETRON

Cautions

Pregnancy manufacturer advises use only when compelling reasons—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects constipation, headache, rash; hypersensitivity reactions reported; *rarely* movement disorders

Licensed use sterile solution not licensed for use in children under 2 years

Indication and dose

Treatment and prevention of nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy

- By mouth

Child 12–18 years 1–2 mg within 1 hour before start of treatment, then 1 mg twice daily during treatment (total daily dose may alternatively be given as a single dose); when intravenous infusion also used, max. combined total 9 mg in 24 hours

- By intravenous infusion

Child 1 month–12 years prevention, 40 micrograms/kg (max. 3 mg) before start of cytotoxic

therapy; treatment, 40 micrograms/kg (max. 3 mg) repeated within 24 hours if necessary (not less than 10 minutes after initial dose)

- By intravenous injection or by intravenous infusion

Child 12–18 years prevention, 3 mg before start of cytotoxic therapy (up to 2 additional 3-mg doses may be given within 24 hours); treatment, 3 mg repeated if necessary (doses must not be given less than 10 minutes apart), max. 9 mg in 24 hours

Administration for *intravenous infusion*, dilute 3 mL in 10–30 mL Glucose 5% or Sodium Chloride 0.9%, or Compound Sodium Lactate; give over 5 minutes

Kytril® (Roche) ^(POM)

Tablets, f/c, granisetron (as hydrochloride) 1 mg, net price 10-tab pack = £65.49; 2 mg, 5-tab pack = £65.49

Sterile solution, granisetron (as hydrochloride) 1 mg/mL, for dilution and use as injection or infusion, net price 1-mL amp = £8.60, 3-mL amp = £25.79

ONDANSETRON

Cautions QT interval prolongation (avoid concomitant administration of drugs that prolong QT interval)

Hepatic impairment reduce dose in moderate or severe hepatic impairment

Pregnancy no information available; manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding manufacturer advises avoid—no information available

Side-effects constipation; headache; flushing; injection-site reactions; *less commonly* hiccups, hypotension, bradycardia, chest pain, arrhythmias, movement disorders, seizures; *on intravenous administration, rarely* dizziness, transient visual disturbances (*very rarely* transient blindness)

Licensed use oral and parenteral preparations not licensed for use in children under 2 years

Indication and dose

Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting

• **By slow intravenous injection or by intravenous infusion**

Child 1–12 years 5 mg/m² immediately before chemotherapy (max. single dose 8 mg), then **either** repeat every 8–12 hours during chemotherapy and for at least 24 hours afterwards or give by mouth

Child 12–18 years 8 mg immediately before chemotherapy, then **either** repeated every 8–12 hours during chemotherapy and for at least 24 hours afterwards or give by mouth

• **By mouth following intravenous administration**

Child 1–12 years 4 mg every 8–12 hours for up to 5 days

Child 12–18 years 8 mg every 8–12 hours for up to 5 days

Treatment and prevention of postoperative nausea and vomiting

• **By slow intravenous injection**

Child 2–12 years 100 micrograms/kg (max. 4 mg), as a single dose before, during, or after induction of anaesthesia

Child 12–18 years 4 mg, as a single dose at induction of anaesthesia

Administration for *slow intravenous injection*, give over 2–5 minutes

For *intravenous infusion*, dilute to a concentration of 320–640 micrograms/mL with Glucose 5% or Sodium Chloride 0.9% or Ringer's Solution; give over at least 15 minutes

Ondansetron (Non-proprietary) (Pom)

Tablets, ondansetron (as hydrochloride) 4 mg, net price 30-tab pack = £89.69; 8 mg, 10-tab pack = £59.71

Brands include *Ondemet*[®]

Injection, ondansetron (as hydrochloride) 2 mg/mL, net price 2-mL amp = £5.39, 4-mL amp = £10.79

Brands include *Ondemet*[®]

Zofran[®] (GSK) (Pom)

Tablets, yellow, f/c, ondansetron (as hydrochloride) 4 mg, net price 30-tab pack = £107.91; 8 mg, 10-tab pack = £71.94

Oral lyophilisates (*Zofran Melt*[®]), ondansetron 4 mg, net price 10-tab pack = £35.97; 8 mg, 10-tab pack = £71.94. Counselling, administration
Excipients include aspartame (section 9.4.1)

Counselling Tablets should be placed on the tongue, allowed to disperse and swallowed

Syrup, sugar-free, strawberry-flavoured, ondansetron (as hydrochloride) 4 mg/5 mL, net price 50-mL pack = £35.97

Injection, ondansetron (as hydrochloride) 2 mg/mL, net price 2-mL amp = £5.99; 4-mL amp = £11.99

Cannabinoid

NABILONE

Cautions history of psychiatric disorder; hypertension; heart disease; adverse effects on mental state can persist for 48–72 hours after stopping;
interactions: Appendix 1 (nabilone)

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications

Hepatic impairment avoid in severe hepatic impairment

Pregnancy manufacturer advises avoid unless essential

Breast-feeding no information available—manufacturer advises avoid

Side-effects drowsiness, vertigo, euphoria, dry mouth, ataxia, visual disturbance, concentration difficulties, sleep disturbance, dysphoria, hypotension, headache and nausea; also confusion, disorientation, hallucinations, psychosis, depres-

sion, decreased coordination, tremors, tachycardia, decreased appetite, and abdominal pain
Behavioural effects Children and carers should be made aware of possible changes of mood and other adverse behavioural effects

Licensed use not licensed for use in children

Indication and dose

Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (under close observation, preferably in hospital setting)

• **By mouth**

Consult local treatment protocol for details

Nabilone (Valeant) (Pom)

Capsules, blue/white, nabilone 1 mg. Net price 20-cap pack = £125.84. Label: 2, counselling, behavioural effects

Hyoscine

HYOSCINE HYDROBROMIDE

(Scopolamine Hydrobromide)

Cautions urinary retention, cardiovascular disease, gastro-intestinal obstruction; **interactions:** Appendix 1 (antimuscarinics)

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving) and may persist for up to 24 hours or longer after removal of patch; effects of alcohol enhanced

Hepatic impairment manufacturer advises caution

Renal impairment manufacturer advises caution

Pregnancy manufacturer advises use only if potential benefit outweighs risk; injection may depress neonatal respiration

Breast-feeding amount too small to be harmful

Contra-indications closed-angle glaucoma

Side-effects drowsiness, dry mouth, dizziness, blurred vision, difficulty with micturition

Licensed use not licensed for use in excessive respiratory secretions or hypersalivation associated with clozapine therapy

Indication and dose**Motion sickness**

• By mouth

Child 4–10 years 75–150 micrograms 30 minutes before start of journey, repeated every 6 hours if required; max. 3 doses in 24 hours

Child 10–18 years 150–300 micrograms 30 minutes before start of journey, repeated every 6 hours if required; max. 3 doses in 24 hours

• By topical application

Child 10–18 years apply 1 patch (1 mg) to hairless area of skin behind ear 5–6 hours before journey; replace if necessary after 72 hours, siting replacement patch behind the other ear

Excessive respiratory secretions

• By mouth or by sublingual administration

Child 2–12 years 10 micrograms/kg, max. 300 micrograms 4 times daily

Child 12–18 years 300 micrograms 4 times daily

• By transdermal route

Child 1 month–3 years 250 micrograms every 72 hours (quarter of a patch)

Child 3–10 years 500 micrograms every 72 hours (half a patch)

Child 10–18 years 1 mg every 72 hours (one patch)

- By subcutaneous injection, intravenous injection, intravenous infusion, or subcutaneous infusion

See Prescribing in Palliative Care, p. 26 and p. 28

Hypersalivation associated with clozapine therapy

- By mouth

Child 12–18 years 300 micrograms up to 3 times daily; max. 900 micrograms daily

Premedication section 15.1.3

Administration patch applied to hairless area of skin behind ear; if less than whole patch required either cut with scissors along full thickness ensuring membrane is not peeled away or cover portion to prevent contact with skin
For administration *by mouth*, injection solution may be given orally

Joy-Rides® (GSK Consumer Healthcare)

Chewable tablets, hyoscine hydrobromide 150 micrograms, net price 12-tab pack = £1.49. Label: 2, 24

Kwells® (Bayer Consumer Care)

Chewable tablets, hyoscine hydrobromide 150 micrograms (*Kwells*® Kids), net price 12-tab pack = £1.52; 300 micrograms, 12-tab pack = £1.52. Label: 2

Scopoderm TTS® (Novartis Consumer Health) (FOM)

Patch, self-adhesive, pink, releasing hyoscine approx. 1 mg/72 hours when in contact with skin. Net price 2 = £4.30. Label: 19, counselling, see below

Counselling Explain accompanying instructions to child and carer, in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time

4.7 Analgesics

4.7.1 Non-opioid analgesics

4.7.2 Opioid analgesics

4.7.3 Neuropathic pain

4.7.4 Antimigraine drugs

The non-opioid drugs (section 4.7.1), paracetamol and ibuprofen (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics (section 4.7.2) are more suitable for moderate to severe pain, particularly of visceral origin.

Pain in palliative care For advice on pain relief in palliative care, see p. 24.

Pain in sickle-cell disease The pain of mild sickle-cell crises is managed with paracetamol, an NSAID, codeine, or dihydrocodeine. Severe crises may require the use of morphine or diamorphine; concomitant use of an NSAID (section 10.1.1) may potentiate analgesia and allow lower doses of the opioid to be used. A mixture of nitrous oxide and oxygen (*Entonox*[®], *Equanox*[®]) may also be used.

Dental and orofacial pain Analgesics should be used judiciously in dental care as a **temporary** measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis (dry socket) or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscess, reliance on analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by **benzylamine** (p. 655) or topical anaesthetics until the cause of the mucosal disorder has been dealt with. However, where a child is febrile, the antipyretic action of **paracetamol** (p. 247) or **ibuprofen** (p. 604) is often helpful.

The *choice* of an analgesic for dental purposes should be based on its suitability for the child. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs) e.g. **ibuprofen** (section 10.1.1). **Paracetamol** has analgesic and antipyretic effects but no anti-inflammatory effect.

Opioid analgesics (section 4.7.2) such as **dihydrocodeine** act on the central nervous system and are traditionally used for *moderate to severe pain*. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with **ibuprofen** is usually continued for about 24 to 72 hours.

Dysmenorrhoea Paracetamol or a NSAID (section 10.1.1) will generally provide adequate relief of pain from dysmenorrhoea. Alternatively use of a combined hormonal contraceptive in adolescent girls may prevent the pain.

4.7.1 Non-opioid analgesics

Paracetamol has analgesic and antipyretic properties but no demonstrable anti-inflammatory activity; unlike opioid analgesics, it does not cause respiratory depression and is less irritant to the stomach than the NSAIDs. **Overdosage** with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days (see Emergency Treatment of Poisoning, p. 37).

Non-steroidal anti-inflammatory analgesics (NSAIDs, section 10.1.1) are particularly useful for the treatment of children with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred. They are also suitable for the relief of pain in *dysmenorrhoea* and to treat pain caused by *secondary bone tumours*, many of which produce lysis of bone and release prostaglandins (see Prescribing in Palliative Care, p. 24). Due to an association with Reye's syndrome (section 2.9), **aspirin** should be avoided in children under 16 years except in Kawasaki syndrome or for its antiplatelet action (section 2.9). NSAIDs are also used for peri-operative analgesia (section 15.1.4.2).

Dental and orofacial pain Most dental pain is relieved effectively by NSAIDs (section 10.1.1).

Paracetamol is less irritant to the stomach than NSAIDs. Paracetamol is a suitable analgesic for children; sugar-free versions can be requested by specifying 'sugar-free' on the prescription.

For further information on the management of dental and orofacial pain, see notes above, p. 246.

Compound analgesic preparations

Compound analgesic preparations that contain a simple analgesic (such as aspirin or paracetamol) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol or aspirin with a *low dose* of an opioid analgesic (e.g. 8 mg of codeine phosphate per compound tablet) may be used in older children but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of **overdosage** (see p. 39) yet may not provide significant additional relief of pain.

A *full dose* of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration). For details of the **side-effects** of opioid analgesics, see p. 249.

PARACETAMOL

(Acetaminophen)

Cautions alcohol dependence; **interactions:**

Appendix 1 (paracetamol)

Hepatic impairment dose-related toxicity—avoid large doses

Renal impairment increase *infusion* dose interval to every 6 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73m²

Pregnancy not known to be harmful

Breast-feeding amount too small to be harmful

Side-effects side-effects rare, but rashes, blood disorders (including thrombocytopenia, leucopenia, neutropenia) reported; hypotension also reported on infusion; **important:** liver damage (and less frequently renal damage) following **overdosage**, see Emergency Treatment of Poisoning, p. 37

Licensed use not licensed for use in children under 2 months by mouth; doses for severe symptoms not licensed

Indication and dose

Pain; pyrexia with discomfort

- By mouth

Neonate 28–32 weeks postmenstrual age 20 mg/kg as a single dose then 10–15 mg/kg every 8–12 hours as necessary; max. 30 mg/kg daily in divided doses

Neonate over 32 weeks postmenstrual age 20 mg/kg as a single dose then 10–15 mg/kg every 6–8 hours as necessary; max. 60 mg/kg daily in divided doses

Child 1–3 months 30–60 mg every 8 hours as necessary; *for severe symptoms* 20 mg/kg as a single dose then 15–20 mg/kg every 6–8 hours; max. 60 mg/kg daily in divided doses

Child 3–12 months 60–120 mg every 4–6 hours (max. 4 doses in 24 hours); *for severe symptoms* 20 mg/kg every 6 hours (max. 90 mg/kg daily in divided doses) for 48 hours (or longer if necessary and if adverse effects ruled out) then 15 mg/kg every 6 hours

Child 1–5 years 120–250 mg every 4–6 hours (max. 4 doses in 24 hours); *for severe symptoms* 20 mg/kg every 6 hours (max. 90 mg/kg daily in divided doses) for 48 hours (or longer if necessary and if adverse effects ruled out) then 15 mg/kg every 6 hours

Child 6–12 years 250–500 mg every 4–6 hours (max. 4 doses in 24 hours); *for severe symptoms* 20 mg/kg (max. 1 g) every 6 hours (max. 90 mg/kg daily in divided doses, not to exceed 4 g) for 48 hours (or longer if necessary and if adverse effects ruled out) then 15 mg/kg every 6 hours; max. 4 g daily

Child 12–18 years 500 mg every 4–6 hours; *for severe symptoms* 1 g every 4–6 hours (max. 4 doses in 24 hours)

- By rectum

Neonate 28–32 weeks postmenstrual age 20 mg/kg as a single dose then 15 mg/kg every 12 hours as necessary; max. 30 mg/kg daily in divided doses

Neonate over 32 weeks postmenstrual age 30 mg/kg as a single dose then 20 mg/kg every 8 hours as necessary; max. 60 mg/kg daily in divided doses

Child 1–3 months 30–60 mg every 8 hours as necessary; *for severe symptoms* 30 mg/kg as a single dose then 20 mg/kg every 8 hours; max. 60 mg/kg daily in divided doses

▢ PARACETAMOL (continued)

Child 3–12 months 60–125 mg every 4–6 hours as necessary (max. 4 doses in 24 hours); for severe symptoms 40 mg/kg as a single dose then 20 mg/kg every 4–6 hours (max. 90 mg/kg daily in divided doses) for 48 hours (or longer if necessary and if adverse effects ruled out) then 15 mg/kg every 6 hours

Child 1–5 years 125–250 mg every 4–6 hours as necessary (max. 4 doses in 24 hours); for severe symptoms 40 mg/kg as a single dose then 20 mg/kg every 4–6 hours (max. 90 mg/kg daily in divided doses) for 48 hours (or longer if necessary and if adverse effects ruled out) then 15 mg/kg every 6 hours

Child 5–12 years 250–500 mg every 4–6 hours as necessary (max. 4 doses in 24 hours); for severe symptoms 40 mg/kg (max. 1 g) as a single dose then 20 mg/kg every 6 hours (max. 90 mg/kg daily in divided doses) for 48 hours (or longer if necessary and if adverse effects ruled out) then 15 mg/kg every 6 hours

Child 12–18 years 500 mg every 4–6 hours; for severe symptoms 1 g every 4–6 hours; max. 4 g daily in divided doses

• By intravenous infusion over 15 minutes

Neonate 7.5 mg/kg every 4–6 hours; max. 30 mg/kg daily

Child body-weight under 10 kg 7.5 mg/kg every 4–6 hours; max. 30 mg/kg daily

Child body-weight 10–50 kg 15 mg/kg every 4–6 hours; max. 60 mg/kg daily

Child body-weight over 50 kg 1 g every 4–6 hours; max. 4 g daily

Post-immunisation pyrexia in infants (see also p. 727)

• By mouth

Child 2–3 months 60 mg as a single dose repeated once after 6 hours if necessary

Paracetamol (Non-proprietary)

Tablets and caplets ^(POM)¹, paracetamol 500 mg. Net price 16 = 17p, 32 = £1.14, 100 = £1.56. Label: 29, 30

Brands include *Panado*[®] 

Capsules ^(POM)¹, paracetamol 500 mg, net price 32-cap pack = £1.05. Label: 29, 30

Brands include *Panadol Capsules*[®] 

Soluble tablets (= Dispersible tablets) ^(POM)², paracetamol 500 mg. Net price 60-tab pack = £4.03. Label: 13, 29, 30

Brands include *Panadol Soluble*[®]  (contains Na⁺ 18.6 mmol/tablet)

Paediatric soluble tablets (= Paediatric dispersible tablets), paracetamol 120 mg. Net price 16-tab pack = 89p. Label: 13, 30

Brands include *Dispro*[®] *Soluble Paracetamol* 

Oral suspension 120 mg/5 mL (= Paediatric Mixture), paracetamol 120 mg/5 mL. Net price 100 mL = 42p. Label: 30

Note BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed; sugar-free versions can be ordered by specifying 'sugar-free' on the prescription

Brands include *Calpo*[®] *Paediatric*, *Calpo*[®] *Paediatric* sugar-free, *Dispro*[®] *Paediatric*, *Medinol*[®] *Paediatric* sugar-free, *Paldesi*[®], *Panado*[®] sugar-free

Oral suspension 250 mg/5 mL (= Mixture), paracetamol 250 mg/5 mL. Net price 100 mL = 66p. Label: 30

Brands include *Calpo*[®] *6 Plus* , *Medinol*[®] *Over 6* , *Paldesi*[®]

Suppositories, paracetamol 60 mg, net price 10 = £9.96; 125 mg, 10 = £11.50; 250 mg, 10 = £23.00; 500 mg, 10 = £10.36. Label: 30

Brands include *Alvedon*[®]

Note other strengths available from 'special-order' manufacturers or specialist importing companies, see p. 943

Dental prescribing on NHS Paracetamol Tablets, Paracetamol Soluble Tablets 500 mg, and Paracetamol Oral Suspension may be prescribed

Perfalgan[®] (Bristol-Myers Squibb) ▼ ^(POM)

Intravenous infusion, paracetamol 10 mg/mL, net price 50-mL vial = £1.80, 100-mL vial = £1.98

Administration give undiluted or dilute to a concentration of 1 mg/mL in Glucose 5% or Sodium Chloride 0.9%; use within 1 hour of dilution

▀ Co-codamol 8/500

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and **no strength is stated**, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate **8 mg** and paracetamol **500 mg** should be dispensed.

² Co-codamol 8/500 (Non-proprietary) ^(POM)

Tablets, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg) Net price 30-tab pack = £1.05. Label: 29, 30

Brands include *Panadeine*[®] 

Dose

Pain, pyrexia

• By mouth

Child 6–12 years ½–1 tablet every 4–6 hours; max. 4 tablets daily

Child 12–18 years 1–2 tablets every 4–6 hours; max. 8 tablets daily

Effervescent or dispersible tablets, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol

1. Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances; for details see *Medicines, Ethics and Practice*, No. 32, London, Pharmaceutical Press, 2008 (and subsequent editions as available)
2. Can be sold to the public under certain circumstances; for exemptions see *Medicines, Ethics and Practice*, No. 32, London, Pharmaceutical Press, 2008 (and subsequent editions as available)

▮ PARACETAMOL (continued)

500 mg), net price 100-tab pack = £4.53. Label: 13, 29, 30

Brands include *Paracodol*® 

Note The Drug Tariff allows tablets of co-codamol labelled 'dispersible' to be dispensed against an order for 'effervescent' and vice versa

Dose

Pain, pyrexia

• By mouth

Child 6–12 years ½–1 tablet in water every 4–6 hours; max. 4 tablets daily

Child 12–18 years 1–2 tablets in water every 4–6 hours; max. 8 tablets daily

Capsules, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg). Net price 10-cap pack = £1.10, 20-cap pack = £1.66. Label: 29, 30

Brands include *Paracodol*® 

Dose

Pain, pyrexia

• By mouth

Child 12–18 years 1–2 capsules every 4 hours; max. 8 capsules daily

4.7.2 Opioid analgesics

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause tolerance, but this is no deterrent in the control of pain in terminal illness, for guidelines see Prescribing in Palliative Care, p. 24. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the child should be assessed at regular intervals.

Cautions Opioids should be used with caution in children with impaired respiratory function and asthma (avoid during an acute attack), hypotension, shock, obstructive or inflammatory bowel disorders, diseases of the biliary tract, and convulsive disorders. A reduced dose is recommended in hypothyroidism or adrenocortical insufficiency. Repeated use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence. Avoid abrupt withdrawal after long-term treatment. Transdermal preparations (fentanyl or buprenorphine patches) are not suitable for acute pain or in those children whose analgesic requirements are changing rapidly, because the long time to steady state prevents rapid titration of the dose.

Palliative care In the control of pain in terminal illness, the cautions listed above should not necessarily be a deterrent to the use of opioid analgesics.

Contra-indications Opioid analgesics should be avoided in children with acute respiratory depression, and when there is a risk of paralytic ileus. They are also contra-indicated in conditions associated with raised intracranial pressure, and in head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment). Comatose children should not be treated with opioid analgesics.

Side-effects Opioid analgesics share many side-effects, although qualitative and quantitative differences exist. The most common side-effects include nausea and vomiting (particularly in initial stages), constipation, dry mouth and biliary spasm; larger doses produce muscle rigidity, hypotension and respiratory depression (for reversal of opioid-induced respiratory depression, see section 15.1.7); neonates, particularly if preterm, may be more susceptible. Other common side-effects of opioid analgesics include bradycardia, tachycardia, palpitation, oedema, postural hypotension, hallucinations, vertigo, euphoria, dysphoria, mood changes, dependence, dizziness, confusion, drowsiness, sleep disturbances, headache, sexual dysfunction, difficulty with micturition, urinary retention, ureteric spasm, miosis, visual disturbances, sweating, flushing, rash, urticaria, and pruritus. **Overdosage:** see Emergency Treatment of Poisoning, p. 39.

Interactions See Appendix 1 (opioid analgesics) (**important:** special hazard with *pethidine* and possibly other opioids and MAOIs).

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Choice Morphine remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of *severe pain in palliative care*. It is given regularly every 4 hours (or every 12 or 24 hours as modified-release preparations). For guidelines on dosage adjustment in palliative care, see p. 24 .

Buprenorphine has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in children dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone. It is used rarely in children.

Codeine is used for the relief of mild to moderate pain but is too constipating for long-term use.

Diamorphine (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In *palliative care* the greater solubility of diamorphine allows effective doses to be injected in smaller volumes and this is important in the emaciated child.

Diamorphine is sometimes given by the intranasal route to treat acute pain in children, for example, in accident and emergency units; however, as yet, there is limited safety and efficacy data to support this practice.

Dihydrocodeine has an analgesic efficacy similar to that of codeine; doses may be given every 4 hours.

Alfentanil, fentanyl and **remifentanyl** are used by injection for intra-operative analgesia (section 15.1.4.3). Fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone is less sedating than morphine and acts for longer periods. In prolonged use, methadone should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdose. Methadone may be used instead of morphine when excitation (or exacerbation of pain) occurs with morphine. Methadone may also be used to treat children with neonatal abstinence syndrome (section 4.10).

Papaveretum should not be used in children; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pethidine produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. Its use in children is not recommended. Pethidine is used for analgesia in labour; however, other opioids, such as morphine or diamorphine, are often preferred for obstetric pain.

Tramadol is used in older children and produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

Dose Doses of opioids may need to be **adjusted individually** according to the degree of analgesia and side-effects; response to opioids varies widely, particularly in the neonatal period. Opioid overdose can have serious consequences and the dose should be calculated and **checked with care**.

Postoperative analgesia A combination of opioid and non-opioid analgesics is used to treat post-operative pain (section 15.1.4.2). The use of intra-operative opioids affects the prescribing of postoperative analgesics and in many cases delays the need for a postoperative analgesic. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression (for the treatment of opioid-induced respiratory depression, see section 15.1.7).

Morphine is used most widely. **Tramadol** is not as effective in severe pain as other opioid analgesics. **Buprenorphine** may antagonise the analgesic effect of previously administered opioids and is generally not recommended. **Pethidine** is

unsuitable for post-operative pain because it is metabolised to norpethidine which may accumulate, particularly in neonates and in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine.

For details of patient-controlled analgesia (PCA) and nurse-controlled analgesia (NCA) to relieve postoperative pain, consult hospital protocols. Formulations specifically designed for PCA are available (*Pharma-Ject*[®] *Morphine Sulphate*).

Dental and orofacial pain Opioid analgesics are **relatively ineffective** in dental pain. Like other opioids, **dihydrocodeine** often causes nausea and vomiting which limits its value in dental pain; if taken for more than a few doses it is also liable to cause constipation. Dihydrocodeine is not very effective in post-operative dental pain.

For the management of dental and orofacial pain, see p. 246.

Addicts Although caution is necessary, addicts (and ex-addicts) may be treated with analgesics in the same way as other people when there is a real clinical need. Doctors do not require a special licence to prescribe opioid analgesics for addicts for relief of pain due to organic disease or injury.

Dependence and withdrawal Psychological dependence rarely occurs when opioids are used for pain relief but tolerance can develop during long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms. For information on the treatment of neonatal abstinence syndrome, see section 4.10.

BUPRENORPHINE

Cautions see notes above; also impaired consciousness; effects only partially reversed by naloxone

Hepatic impairment avoid or reduce dose—may precipitate coma

Renal impairment reduce dose or avoid, increased and prolonged effect; increased cerebral sensitivity

Pregnancy depresses neonatal respiration; withdrawal effects in neonates of dependent mothers; gastric stasis and risk of inhalation pneumonia in mother during labour

Breast-feeding amount too small to be harmful; manufacturer advises contra-indicated in the treatment of opioid dependence

Contra-indications see notes above; also myasthenia gravis

Side-effects see notes above; can induce mild withdrawal symptoms in children dependent on opioids; also diarrhoea, abdominal pain, anorexia, dyspepsia; vasodilatation; dyspnoea; paraesthesia, asthenia, fatigue, agitation, anxiety; *less commonly* flatulence, taste disturbance, hypertension, syncope, hypoxia, wheezing, cough, restlessness, depersonalisation, dysarthria, impaired memory, hypoaesthesia, tremor, influenza-like symptoms, pyrexia, rhinitis, rigors, muscle cramp, myalgia, tinnitus, dry eye, and dry skin; *rarely* paralytic ileus, dysphagia, diverticulitis, impaired concentration, and psychosis; *very rarely* retching, hyperventilation, hiccups, and muscle fasciculation

Licensed use sublingual tablets not licensed for use in children under 6 years; injection not licensed for use in children under 6 months

Indication and dose

Moderate to severe pain

• By sublingual administration

Child body-weight 16–25 kg 100 micrograms every 6–8 hours

Child body-weight 25–37.5 kg 100–200 micrograms every 6–8 hours

Child body-weight 37.5–50 kg 200–300 micrograms every 6–8 hours

Child body-weight over 50 kg 200–400 micrograms every 6–8 hours

• By intramuscular or by slow intravenous injection

Child 6 months–12 years 3–6 micrograms/kg every 6–8 hours, max. 9 micrograms/kg

Child 12–18 years 300–600 micrograms every 6–8 hours

Administration for administration *by mouth*, tablets may be halved

Temgesic[®] (Schering-Plough) 

Tablets (sublingual), buprenorphine (as hydrochloride), 200 micrograms, net price 50-tab pack = £5.33; 400 micrograms, 50-tab pack = £10.66. Label: 2, 26

Injection, buprenorphine (as hydrochloride) 300 micrograms/mL, net price 1-mL amp = 49p

CODEINE PHOSPHATE

Cautions see notes above; also cardiac arrhythmias; myasthenia gravis; acute abdomen; gallstones

Variation in metabolism The capacity to metabolise codeine can vary considerably between individuals and lead to either reduced therapeutic effect or marked increase in side-effects

Hepatic impairment avoid or reduce dose—may precipitate coma

Renal impairment reduce dose or avoid; increased and prolonged effect; increased cerebral sensitivity

Pregnancy depresses neonatal respiration; withdrawal effects in neonates of dependent mothers; gastric stasis and risk of inhalation pneumonia in mother during labour

Breast-feeding amount usually too small to be harmful; however, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant

Contra-indications see notes above

Side-effects see notes above; also abdominal pain, anorexia, seizures, malaise, hypothermia, and muscle fasciculation; pancreatitis also reported

DIAMORPHINE HYDROCHLORIDE

(Heroin Hydrochloride)

Cautions see notes above; also severe diarrhoea; toxic psychosis, CNS depression; severe cor pulmonale

Hepatic impairment avoid or reduce dose—may precipitate coma

Renal impairment reduce dose or avoid; increased and prolonged effect; increased cerebral sensitivity

Pregnancy depresses neonatal respiration; withdrawal effects in neonates of dependent mothers; gastric stasis and risk of inhalation pneumonia in mother during labour

Breast-feeding therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring

Contra-indications see notes above; also delayed gastric emptying; phaeochromocytoma

Side-effects see notes above; also anorexia, taste disturbance; syncope; asthenia, raised intracranial pressure; myocardial infarction also reported

Licensed use intranasal route not licensed

Indication and dose

Acute or chronic pain

• By mouth

Child 1 month–12 years 100–200 micrograms/kg (max. 10 mg) every 4 hours as necessary

Child 12–18 years 5–10 mg every 4 hours as necessary

• By intravenous administration

Neonate (ventilated) initially by intravenous injection over 30 minutes, 50 micrograms/kg then by continuous intravenous infusion, 15 micrograms/kg/hour

Licensed use tablets not licensed for use in children; injection not licensed for use in children under 1 year

Indication and dose

Mild to moderate pain

- By mouth or by rectum or by subcutaneous injection or by intramuscular injection

Neonate 0.5–1 mg/kg every 4–6 hours

Child 1 month–12 years 0.5–1 mg/kg every 4–6 hours, max. 240 mg daily

Child 12–18 years 30–60 mg every 4–6 hours, max. 240 mg daily

Codeine Phosphate (Non-proprietary)

Tablets (PoM), codeine phosphate 15 mg, net price 28 = £1.08; 30 mg, 28 = £1.24; 60 mg, 28 = £1.73. Label: 2

Syrup (PoM), codeine phosphate 25 mg/5 mL. Net price 100 mL = 90p. Label: 2

Injection (CD), codeine phosphate 60 mg/mL. Net price 1-mL amp = £2.44

Neonate (non-ventilated) by continuous intravenous infusion 2.5–7 micrograms/kg/hour

Child 1 month–12 years by continuous intravenous infusion 12.5–25 micrograms/kg/hour

• By intravenous injection

Child 1–3 months 20 micrograms/kg every 6 hours as necessary

Child 3–6 months 25–50 micrograms/kg every 6 hours as necessary

Child 6–12 months 75 micrograms/kg every 4 hours as necessary

Child 1–12 years 75–100 micrograms/kg every 4 hours as necessary

Child 12–18 years 2.5–5 mg every 4 hours as necessary

• By continuous subcutaneous infusion
See Prescribing in Palliative Care, p. 24• By subcutaneous or by intramuscular injection
Child 12–18 years 5 mg every 4 hours as necessary

Acute pain in an emergency setting; short painful procedures

• Intranasally (but see p. 250)

Child 3–18 years 100 micrograms/kg, max. 10 mg

Administration for intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%; Glucose 5% is preferable

For intranasal administration, diamorphine powder should be dissolved in sufficient volume of Water for Injections to provide the requisite dose

◊ DIAMORPHINE HYDROCHLORIDE (continued)

in 0.2mL of solution; use solution immediately after preparation

Diamorphine (Non-proprietary) CD

Tablets, diamorphine hydrochloride 10 mg. Net price 100-tab pack = £12.92. Label: 2

Injection, powder for reconstitution, diamorphine hydrochloride. Net price 5-mg amp = £2.69, 10-mg amp = £3.37, 30-mg amp = £3.60, 100-mg amp = £9.92, 500-mg amp = £43.44

Extemporaneous formulations available see Extemporaneous Preparations, p. 8

DIHYDROCODEINE TARTRATE

Cautions see notes above; also pancreatitis; severe cor pulmonale

Hepatic impairment avoid or reduce dose—may precipitate coma

Renal impairment reduce dose or avoid; increased and prolonged effect; increased cerebral sensitivity

Pregnancy depresses neonatal respiration—withdrawal effects in neonates of dependent mothers; gastric stasis and risk of inhalation pneumonia in mother during labour

Breast-feeding manufacturer advises use only if potential benefit outweighs risk

Contra-indications see notes above

Side-effects see notes above; also paralytic ileus, abdominal pain, and paraesthesia

Licensed use most preparations not licensed for use in children under 4 years

Indication and dose

Moderate to severe pain

• By mouth or by intramuscular injection or by subcutaneous injection

Child 1–4 years 500 micrograms/kg every 4–6 hours

Child 4–12 years 0.5–1 mg/kg (max. 30 mg) every 4–6 hours

Child 12–18 years 30 mg (max. 50 mg by intramuscular or deep subcutaneous injection) every 4–6 hours

Dihydrocodeine (Non-proprietary)

Tablets PoM, dihydrocodeine tartrate 30 mg. Net price 28 = £1.34. Label: 2, 21

Dental prescribing on NHS Dihydrocodeine Tablets 30 mg may be prescribed

Oral solution PoM, dihydrocodeine tartrate 10 mg/5 mL. Net price 150 mL = £3.08. Label: 2, 21

Injection CD, dihydrocodeine tartrate 50 mg/mL. Net price 1-mL amp = £2.29

DF 118 Forte® (Martindale) PoM

Tablets, dihydrocodeine tartrate 40 mg. Net price 100-tab pack = £11.51. Label: 2, 21

Dose

Severe pain

• By mouth

Child 12–18 years 40–80 mg 3 times daily; max. 240 mg daily

Modified release

DHC Continus® (Napp) PoM

Tablets, m/r, dihydrocodeine tartrate 60 mg, net price 56-tab pack = £5.50; 90 mg, 56-tab pack = £8.66; 120 mg, 56-tab pack = £11.57. Label: 2, 25

Dose

Chronic severe pain

• By mouth

Child 12–18 years 60–120 mg every 12 hours

FENTANYL

Cautions see notes above; also diabetes mellitus, impaired consciousness, cerebral tumour, myasthenia gravis

Transdermal fentanyl

Fever or external heat Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption)

Respiratory depression Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients

Hepatic impairment avoid or reduce dose—may precipitate coma

Renal impairment reduce dose or avoid; increased and prolonged effect; increased cerebral sensitivity

Pregnancy depresses neonatal respiration; withdrawal effects in neonates of dependent mothers;

gastric stasis and risk of inhalation pneumonia in mother during labour

Breast-feeding amount too small to be harmful

Contra-indications see notes above

Side-effects see notes above; also abdominal pain, anorexia, dyspepsia, mouth ulcer, taste disturbance, dry mouth; vasodilatation; apnoea; anxiety; myoclonus; *less commonly* flatulence, diarrhoea, laryngospasm, dyspnoea, hypoventilation, depersonalisation, dysarthria, amnesia, incoordination, paraesthesia, malaise, agitation, tremor, and muscle weakness; *rarely* hiccups and arrhythmia; *very rarely* paralytic ileus, haemoptysis, psychosis, and seizures; shock, asystole, pyrexia, ataxia, and muscle fasciculation also reported; *with patches*, local reactions such as rash, erythema, and itching reported

Licensed use lozenges not licensed for use in children

□ FENTANYL (continued)

Indication and dose

Severe chronic pain

• By transdermal route

Child 2–16 years currently treated with strong opioid analgesic, initial dose based on previous 24-hour opioid requirement (consult product literature)

Child 2–18 years child not currently treated with strong opioid analgesic (but see Cautions, p. 249), one '12' or '25 micrograms/hour' patch replaced after 72 hours; child **currently treated** with strong opioid analgesic, initial dose based on previous 24-hour opioid requirement (consult product literature)

Dose adjustment When starting, evaluation of the analgesic effect should **not** be made before the system has been worn for **24 hours** (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application; if necessary dose should be adjusted at 72-hour intervals in steps of 12–25 micrograms/hour. More than one patch may be used at a time for doses greater than 100 micrograms/hour (but applied at *same time* to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (**important**: it may take up to 25 hours for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually).

Long duration of action In view of the long duration of action, children who have had severe side-effects should be monitored for up to 24 hours after patch removal

Breakthrough pain and premedication analgesia, see under preparation below

Peri-operative analgesia section 15.1.4.3

Conversion (from oral morphine to transdermal fentanyl), see Prescribing in Palliative Care, p. 25

Administration For *patches*, apply to dry, non-irritated, non-irradiated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the same area for several days).

▲ Lozenges

Actiq® (Cephalon) 

Lozenge, (with oromucosal applicator), fentanyl (as citrate) 200 micrograms, net price 3 = £18.58, 30 = £185.80; 400 micrograms, 3 = £18.58, 30 = £185.80; 600 micrograms, 3 = £18.58, 30 = £185.80; 800 micrograms, 3 = £18.58, 30 = £185.80; 1.2 mg,

3 = £18.58, 30 = £185.80; 1.6 mg, 3 = £18.58, 30 = £185.80. Label: 2

Dose

Breakthrough pain

• By transmucosal application (lozenge with oromucosal applicator)

Child 2–18 years (over 10 kg body-weight) 15–20 micrograms/kg as a single dose; max. dose 400 micrograms

Note If more than 4 episodes of breakthrough pain each day, adjust dose of background analgesic

Premedication analgesia

• By transmucosal application (lozenge with oromucosal applicator)

Child 2–18 years (over 10 kg body-weight) 15–20 micrograms/kg as a single dose; max. 400 micrograms

▲ Patches

Prescriptions Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write '*Fentanyl 25 patches*' to prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. '*one patch to be applied every 72 hours*'. The total quantity of patches should be written in words and figures.

Fentanyl (Non-proprietary) 

Patches, self-adhesive, fentanyl, '12' patch (releasing approx. 12 micrograms/hour for 72 hours), net price 5 = £18.85; '25' patch (releasing approx. 25 micrograms/hour for 72 hours), 5 = £26.94; '50' patch (releasing approx. 50 micrograms/hour for 72 hours), 5 = £50.32; '75' patch (releasing approx. 75 micrograms/hour for 72 hours), 5 = £70.15; '100' patch (releasing approx. 100 micrograms/hour for 72 hours), 5 = £86.46. Label: 2, counselling, administration

Brands include *Matrifem®*, *Osmani®*, *Tilofy®*, *Victanyl®*

Durogesic DTrans® (Janssen-Cilag) 

Patches, self-adhesive, transparent, fentanyl, '12' patch (releasing approx. 12 micrograms/hour for 72 hours), net price 5 = £18.85; '25' patch (releasing approx. 25 micrograms/hour for 72 hours), 5 = £26.94; '50' patch (releasing approx. 50 micrograms/hour for 72 hours), 5 = £50.32; '75' patch (releasing approx. 75 micrograms/hour for 72 hours), 5 = £70.15; '100' patch (releasing approx. 100 micrograms/hour for 72 hours), 5 = £88.32. Label: 2, counselling, administration

HYDROMORPHONE HYDROCHLORIDE

Cautions see notes above; also pancreatitis; toxic psychosis

Hepatic impairment avoid or reduce dose—may precipitate coma

Renal impairment reduce dose or avoid; increased and prolonged effect; increased cerebral sensitivity

Pregnancy depresses neonatal respiration; withdrawal effects in neonates of dependent mothers;

gastric stasis and risk of inhalation pneumonia in mother during labour

Breast-feeding manufacturer advises avoid—no information available

Contra-indications see notes above; also acute abdomen

Side-effects see notes above; also paralytic ileus, seizures, asthenia, agitation, and myoclonus

◊ HYDROMORPHONE HYDROCHLORIDE (continued)

Indication and dose

Severe pain in cancer

• By mouth

Child 12–18 years 1.3 mg every 4 hours, increased if necessary according to severity of pain

Administration Swallow whole capsule or sprinkle contents on soft food

Palladone® (Napp)

Capsules, hydromorphone hydrochloride 1.3 mg (orange/clear), net price 56-cap pack = £8.82; 2.6 mg (red/clear), 56-cap pack = £17.64. Label: 2, counselling, see below

▲ Modified release

Palladone® SR (Napp)

Capsules, m/r, hydromorphone hydrochloride 2 mg (yellow/clear), net price 56-cap pack = £20.98; 4 mg (pale blue/clear), 56-cap pack = £28.75; 8 mg (pink/clear), 56-cap pack = £56.08; 16 mg (brown/clear), 56-cap pack = £106.53; 24 mg (dark blue/clear), 56-cap pack = £159.82. Label: 2, counselling, see below

Dose

Severe pain in cancer

• By mouth

Child 12–18 years 4 mg every 12 hours, increased if necessary according to severity of pain

Counselling Swallow whole or open capsule and sprinkle contents on soft food

METHADONE HYDROCHLORIDE

Cautions see notes above; also myasthenia gravis; history of cardiac conduction abnormalities, family history of sudden death (ECG monitoring recommended; see also QT Interval Prolongation, below)

QT interval prolongation The CHM has recommended that children with the following risk factors for QT interval prolongation are carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; children requiring more than 100 mg daily should also be monitored

Hepatic impairment avoid or reduce dose in liver disease—may precipitate coma

Renal impairment reduce dose or avoid; increased and prolonged effect; increased cerebral sensitivity

Pregnancy depresses neonatal respiration; withdrawal effects in neonates of dependent mothers; gastric stasis and risk of inhalation pneumonia in mother during labour

Breast-feeding withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation

Contra-indications see notes above; also phaeochromocytoma

Side-effects see notes above; also QT interval prolongation; torsade de pointes, hypothermia, restlessness, raised intracranial pressure, dysmenorrhoea, dry eyes, and hyperprolactinaemia

Licensed use not licensed for use in children

Indication and dose

Neonatal opioid withdrawal dose may vary, consult local guidelines

• By mouth

Neonate initially 100 micrograms/kg increased by 50 micrograms/kg every 6 hours until symptoms are controlled; for maintenance, total daily dose that controls symptoms given in 2 divided doses; to withdraw, reduce dose over 7–10 days

Methadone (Non-proprietary)

Oral solution 1 mg/mL, methadone hydrochloride 1 mg/mL, net price 30 mL = 60p, 50 mL = £1.03, 100 mL = £1.35, 500 mL = £9.52. Label: 2
Brands include *Eptadone*®, *Metharose*® (sugar-free), *Physeptone* (also as sugar-free)

Safe Practice This preparation is 2½ times the strength of Methadone Linctus; many preparations of this strength are licensed for opioid dependence only but some are also licensed for analgesia in severe pain

MORPHINE SALTS

Cautions see notes above; also pancreatitis, myasthenia gravis, cardiac arrhythmias, severe cor pulmonale

Hepatic impairment may precipitate coma in hepatic impairment—avoid or reduce dose (although many such children tolerate morphine well)

Renal impairment reduce dose or avoid, increased and prolonged effect; increased cerebral sensitivity

Pregnancy depresses neonatal respiration; withdrawal effects in neonates of dependent mothers; gastric stasis and risk of inhalation pneumonia in mother during labour

Breast-feeding therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of

dependent mothers; breast-feeding not best method of treating dependence in offspring

Contra-indications see notes above; also delayed gastric emptying, acute abdomen; heart failure secondary to chronic lung disease; phaeochromocytoma

Side-effects see notes above; also paralytic ileus, abdominal pain, anorexia, dyspepsia, exacerbation of pancreatitis, taste disturbance; hypertension, hypothermia, syncope, bronchospasm, inhibition of cough reflex; restlessness, seizures, paraesthesia, asthenia, malaise, disorientation, excitation, agitation, delirium, raised intracranial pressure; amenorrhoea, myoclonus, muscle fasciculation, and rhabdomyolysis

▢ MORPHINE SALTS (continued)

Licensed use *Oramorph*[®] solution not licensed for use in children under 1 year; *Oramorph*[®] unit dose vials not licensed for use in children under 6 years; *Sevredol*[®] tablets not licensed for use in children under 3 years; *MST Continus*[®] preparations licensed to treat children with cancer pain (age-range not specified by manufacturer); *MXL*[®] capsules not licensed for use in children under 1 year

Indication and dose

Pain

- By subcutaneous injection

Neonate initially 100 micrograms/kg every 6 hours, adjusted according to response

Child 1–6 months initially 100–200 micrograms/kg every 6 hours, adjusted according to response

Child 6 months–2 years initially 100–200 micrograms/kg every 4 hours, adjusted according to response

Child 2–12 years initially 200 micrograms/kg every 4 hours, adjusted according to response

Child 12–18 years initially 2.5–10 mg every 4 hours, adjusted according to response

- By intravenous injection over at least 5 minutes

Neonate initially 50 micrograms/kg every 6 hours, adjusted according to response

Child 1–6 months initially 100 micrograms/kg every 6 hours, adjusted according to response

Child 6 months–12 years initially 100 micrograms/kg every 4 hours, adjusted according to response

Child 12–18 years initially 2.5 mg every 4 hours, adjusted according to response

- By intravenous injection and infusion

Neonate initially by intravenous injection (over at least 5 minutes) 25–100 micrograms/kg then by continuous intravenous infusion 5–40 micrograms/kg/hour adjusted according to response

Child 1–6 months initially by intravenous injection (over at least 5 minutes) 100–200 micrograms/kg then by continuous intravenous infusion 10–30 micrograms/kg/hour adjusted according to response

Child 6 months–12 years initially by intravenous injection (over at least 5 minutes) 100–200 micrograms/kg then by continuous intravenous infusion 20–30 micrograms/kg/hour adjusted according to response

Child 12–18 years initially by intravenous injection (over at least 5 minutes) 2.5–10 mg then by continuous intravenous infusion 20–30 micrograms/kg/hour adjusted according to response

- By mouth or by rectum

Child 1–12 months initially 80–200 micrograms/kg every 4 hours, adjusted according to response

Child 1–2 years initially 200–400 micrograms/kg every 4 hours, adjusted according to response

Child 2–12 years initially 200–500 micrograms/kg (max. 20 mg) every 4 hours, adjusted according to response

Child 12–18 years initially 5–20 mg every 4 hours, adjusted according to response

- By continuous subcutaneous infusion

Child 1–3 months 10 micrograms/kg/hour

Child 3 months–18 years 20 micrograms/kg/hour

Neonatal opioid withdrawal under specialist supervision

- By mouth

Neonate initially 40 micrograms/kg every 4 hours until symptoms controlled, increase dose if necessary; reduce frequency gradually over 6–10 days, and stop when 40 micrograms/kg once daily achieved; dose may vary, consult local guidelines

Administration for continuous intravenous infusion, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%

Neonatal intensive care, dilute 2.5 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 micrograms/kg/hour

▀ Oral solutions

Note For advice on transfer from oral solutions of morphine to modified-release preparations of morphine, see Prescribing in Palliative Care, p 24

Morphine Oral Solutions

(PoM) or (CD)

Oral solutions of morphine can be prescribed by writing the formula:

Morphine hydrochloride 5 mg
Chloroform water to 5 mL

Note The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes (CD). For sample prescription see Controlled Drugs and Drug Dependence, p. 19. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.

Oramorph[®] (Boehringer Ingelheim)

Oramorph[®] oral solution (PoM), morphine sulphate 10 mg/5 mL. Net price 100-mL pack = £1.87; 300-mL pack = £5.21; 500-mL pack = £7.86. Label: 2

Oramorph[®] concentrated oral solution (CD), sugar-free, morphine sulphate 100 mg/5 mL. Net price 30-mL pack = £5.24; 120-mL pack = £19.57 (both with calibrated dropper). Label: 2

◊ MORPHINE SALTS (continued)

▲ Tablets

Sevredol® (Napp)

Tablets, f/c, scored, morphine sulphate 10 mg (blue), net price 56-tab pack = £5.61; 20 mg (pink), 56-tab pack = £11.21; 50 mg (pale green), 56-tab pack = £28.02. Label: 2

▲ Modified-release 12-hourly oral preparations

MST Continus® (Napp)

Tablets, m/r, f/c, morphine sulphate 5 mg (white), net price 60-tab pack = £3.29; 10 mg (brown), 60-tab pack = £5.48; 15 mg (green), 60-tab pack = £9.61; 30 mg (purple), 60-tab pack = £13.17; 60 mg (orange), 60-tab pack = £25.69; 100 mg (grey), 60-tab pack = £40.66; 200 mg (green), 60-tab pack = £81.34. Label: 2, 25

Suspension (= sachet of granules to mix with water), m/r, pink, morphine sulphate 20 mg/sachet, net price 30-sachet pack = £24.58; 30 mg/sachet, 30-sachet pack = £25.54; 60 mg/sachet, 30-sachet pack = £51.09; 100 mg/sachet, 30-sachet pack = £85.15; 200 mg/sachet pack, 30-sachet pack = £170.30. Label: 2, 13

Dose

• By mouth

Every 12 hours, dose adjusted according to daily morphine requirements; for further advice on determining dose, see Prescribing in Palliative Care, p. 24; dosage requirements should be reviewed if the brand is altered

Note Prescriptions must also specify 'tablets' or 'suspension' (i.e. 'MST Continus tablets' or 'MST Continus suspension')

▲ Modified-release 24-hourly oral preparations

MXL® (Napp)

Capsules, m/r, morphine sulphate 30 mg (light blue), net price 28-cap pack = £10.91; 60 mg (brown), 28-cap pack = £14.95; 90 mg (pink), 28-cap pack = £22.04; 120 mg (green), 28-cap pack = £29.15; 150 mg (blue), 28-cap pack = £36.43; 200 mg (red-brown), 28-cap pack = £46.15. Label: 2, counselling, see below

Dose

• By mouth

Every 24 hours, dose adjusted according to daily morphine requirements; for further advice on determining dose, see Prescribing in Palliative Care, p. 24; dosage requirements should be reviewed if the brand is altered

Counselling Swallow whole or open capsule and sprinkle contents on soft food

Note Prescriptions must also specify 'capsules' (i.e. 'MXL capsules')

▲ Suppositories

Morphine (Non-proprietary)

Suppositories, morphine hydrochloride or sulphate 10 mg, net price 12 = £8.69; 15 mg, 12 = £7.50; 20 mg, 12 = £33.22; 30 mg, 12 = £10.90. Label: 2 Available from Aurum, Martindale

Note Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber

Morphine sulphate 5 mg suppositories available from 'special-order' manufacturers or specialist importing companies, see p. 943

▲ Injections

Morphine Sulphate (Non-proprietary)

Injection, morphine sulphate 10, 15, 20, and 30 mg/mL, net price 1- and 2-mL amp (all) = 72p-£1.40

Intravenous infusion, morphine sulphate 1 mg/mL, net price 50-mL vial = £5.00; 2 mg/mL, 50-mL vial = £5.89

Miniject® Morphine Sulphate (UCB Pharma)

Injection, morphine sulphate 1 mg/mL, net price 10-mL disposable syringe = £7.58

▲ Injection with antiemetic

Caution Not recommended in palliative care, see Nausea and Vomiting, p. 27

Cyclimorph® (Amdipharm)

Cyclimorph-10® Injection, morphine tartrate 10 mg, cyclizine tartrate 50 mg/mL. Net price 1-mL amp = £1.34

Dose

Moderate to severe pain (short-term use only)

• By subcutaneous, intramuscular, or intravenous injection

Child 12–18 years 1 mL, repeated not more often than every 4 hours, max. 3 doses in any 24-hour period

Cyclimorph-15® Injection, morphine tartrate 15 mg, cyclizine tartrate 50 mg/mL. Net price 1-mL amp = £1.39

Dose

Moderate to severe pain (short-term use only)

• By subcutaneous, intramuscular, or intravenous injection

Child 12–18 years 1 mL, repeated not more often than every 4 hours, max. 3 doses in any 24-hour period

OXYCODONE HYDROCHLORIDE

Cautions see notes above; also toxic psychosis; pancreatitis

Contra-indications see notes above; also acute abdomen; delayed gastric emptying; chronic constipation; cor pulmonale; acute porphyria (section 9.8.2)

Hepatic impairment avoid in moderate to severe impairment

Renal impairment reduce dose or avoid, increased and prolonged effect; increased cerebral sensitivity

Pregnancy depresses neonatal respiration; withdrawal effects in neonates of dependent mothers; gastric stasis and risk of inhalation pneumonia in mother during labour

Breast-feeding present in milk—manufacturer advises avoid

□ OXYCODONE HYDROCHLORIDE (continued)

Side-effects see notes above; also diarrhoea, abdominal pain, anorexia, dyspepsia; bronchospasm, dyspnoea, impaired cough reflex; asthenia, anxiety; chills; muscle fasciculation; *less commonly* paralytic ileus, gastritis, flatulence, dysphagia, taste disturbance, belching, hiccups, vasodilatation, supraventricular tachycardia, syncope, amnesia, hypoaesthesia, restlessness, seizures, pyrexia, amenorrhoea, hypotonia, paraesthesia, disorientation, malaise, agitation, speech disorder, tremor, and dry skin

Licensed use not licensed for use in children

Indication and dose

Moderate to severe pain in palliative care (see also Prescribing in Palliative Care, p. 25)

• By mouth

Child 1 month–12 years initially 200 micrograms/kg (up to 5 mg) every 4–6 hours, dose increased if necessary according to severity of pain

Child 12–18 years initially 5 mg every 4–6 hours, dose increased if necessary according to severity of pain

Oxynorm® (Napp) 

Capsules, oxycodone hydrochloride 5 mg (orange/beige), net price 56-cap pack = £12.07; 10 mg (white/beige), 56-cap pack = £24.14; 20 mg (pink/beige), 56-cap pack = £48.27. Label: 2

Liquid (= oral solution), sugar-free, oxycodone hydrochloride 5 mg/5 mL, net price 250 mL = £10.26. Label: 2

Concentrate (= concentrated oral solution), sugar-free, oxycodone hydrochloride 10 mg/mL, net price 120 mL = £49.25. Label: 2

▲ Modified release

OxyContin® (Napp) 

Tablets, f/c, m/r, oxycodone hydrochloride 5 mg (blue), net price 28-tab pack = £13.23; 10 mg (white), 56-tab pack = £26.45; 20 mg (pink), 56-tab pack = £52.89; 40 mg (yellow), 56-tab pack = £105.80; 80 mg (green), 56-tab pack = £211.61. Label: 2, 25

Dose

Moderate to severe pain in palliative care

• By mouth

Child 8–12 years initially, 5 mg every 12 hours, increased if necessary according to severity of pain

Child 12–18 years initially, 10 mg every 12 hours, increased if necessary according to severity of pain

PAPAVERETUM

Safe Practice Do **not** confuse with papaverine

A mixture of 253 parts of morphine hydrochloride, 23 parts of papaverine hydrochloride and 20 parts of codeine hydrochloride

The CSM has advised that to avoid confusion the figures of 7.7 mg/mL or 15.4 mg/mL should be used for prescribing purposes

Cautions see notes above; supraventricular tachycardia

Contra-indications see notes above; heart failure secondary to chronic lung disease; phaeochromocytoma

Side-effects see notes above; also hypothermia

Indication and dose

Premedication, postoperative analgesia, severe chronic pain

• By subcutaneous or intramuscular injection

Neonate 115 micrograms/kg repeated every 4 hours if necessary

Child 1–12 months 154 micrograms/kg repeated every 4 hours if necessary

Child 1–6 years 1.93–3.85 mg repeated every 4 hours if necessary

Child 6–12 years 3.85–7.7 mg repeated every 4 hours if necessary

Child 12–18 years 7.7–15.4 mg repeated every 4 hours if necessary

• By intravenous injection

Generally 25–50% of the corresponding subcutaneous or intramuscular dose

Papaveretum (Non-proprietary)  

Injection, papaveretum 15.4 mg/mL (providing the equivalent of 10 mg of anhydrous morphine/mL), net price 1-mL amp = £1.64

PETHIDINE HYDROCHLORIDE

Cautions see notes above; not suitable for severe continuing pain; accumulation of metabolites may result in neurotoxicity; myasthenia gravis; cardiac arrhythmias, severe cor pulmonale

Hepatic impairment avoid or reduce dose—may precipitate coma

Renal impairment reduce dose or avoid; increased and prolonged effect; increased cerebral sensitivity

Pregnancy depresses neonatal respiration; withdrawal effects in neonates of dependent mothers;

gastric stasis and risk of inhalation pneumonia in mother during labour

Breast-feeding present in milk but not known to be harmful

Contra-indications see notes above; phaeochromocytoma

Side-effects see notes above; also restlessness and hypothermia; convulsions reported in **over-dosage**

◀ PETHIDINE HYDROCHLORIDE (continued)

Indication and dose

Obstetric analgesia

- By subcutaneous or by intramuscular injection

Child 12–18 years 50–100 mg, repeated 1–3 hours later if necessary; max. 400 mg in 24 hours

Pethidine (Non-proprietary) (CG)

Injection, pethidine hydrochloride 50 mg/mL, net price 1-mL amp = 53p, 2-mL amp = 56p; 10 mg/mL, 5-mL amp = £3.17, 10-mL amp = £2.18

TRAMADOL HYDROCHLORIDE

Cautions see notes above; impaired consciousness; excessive bronchial secretions; not suitable as substitute in opioid-dependent patients

General anaesthesia Not recommended for analgesia during anaesthetically light planes of general anaesthesia (possibly increased intra-operative recall reported)

Hepatic impairment avoid or reduce dose—may precipitate coma

Renal impairment reduce dose or avoid; increased and prolonged effect; increased cerebral sensitivity

Pregnancy embryotoxic in *animal studies*—manufacturers advise avoid; depresses neonatal respiration; withdrawal effects in neonates of dependent mothers; gastric stasis and risk of inhalation pneumonia in mother during labour

Breast-feeding amount probably too small to be harmful, but manufacturer advises avoid

Contra-indications see notes above; uncontrolled epilepsy; acute porphyria (section 9.8.2)

Side-effects see notes above; also diarrhoea; fatigue; *less commonly* retching, gastritis, and flatulence; *rarely* anorexia, syncope, hypertension, bronchospasm, dyspnoea, wheezing, seizures, paraesthesia, and muscle weakness; blood disorders also reported

Licensed use not licensed for use in children under 12 years

Indication and dose

Moderate to severe pain

- By mouth

Child 12–18 years 50–100 mg not more often than every 4 hours; total of more than 400 mg daily not usually required

- By intramuscular injection or by intravenous injection (over 2–3 minutes) or by intravenous infusion

Child 12–18 years 50–100 mg every 4–6 hours

Postoperative pain

- By mouth

Child 12–18 years 100 mg initially then 50 mg every 10–20 minutes if necessary during first hour to total max. 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours; max. 600 mg daily

Administration for *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9% or Compound Sodium Lactate or Ringer's Solution

Tramadol Hydrochloride (Non-proprietary) (POM)

Capsules, tramadol hydrochloride 50 mg. Net price 30-cap pack = £1.39, 100-cap pack = £2.21. Label: 2
Brands include *Tramake*[®]

Injection, tramadol hydrochloride 50 mg/mL. Net price 2-mL amp = £1.15

Zamadol[®] (Meda) (POM)

Capsules, tramadol hydrochloride 50 mg, net price 100-cap pack = £8.00. Label: 2

Orodispersible tablets (Zamadol Melt[®]), tramadol hydrochloride 50 mg, net price 60-tab pack = £7.12, 100-tab pack = £11.88. Label: 2, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling *Zamadol Melt[®]* should be sucked and then swallowed. May also be dispersed in water

Injection, tramadol hydrochloride 50 mg/mL, net price 2-mL amp = £1.10

Zydol[®] (Grünenthal) (POM)

Capsules, green/yellow, tramadol hydrochloride 50 mg, net price 30-cap pack = £3.35, 100-cap pack = £16.91. Label: 2

Soluble tablets, tramadol hydrochloride 50 mg, net price 20-tab pack = £3.95, 100-tab pack = £17.27. Label: 2, 13

Injection, tramadol hydrochloride 50 mg/mL. Net price 2-mL amp = £1.24

▲ Modified-release 12-hourly preparations

Dromadol[®] SR (IVAX) (POM)

Tablets, m/r, tramadol hydrochloride 100 mg (white), net price 60-tab pack = £12.78; 150 mg (beige), 60-tab pack = £19.17; 200 mg (orange), 60-tab pack = £25.56. Label: 2, 25

Dose

Moderate to severe pain

- By mouth

Child 12–18 years initially 100 mg twice daily increased if necessary; usual max. 200 mg twice daily

Larapam[®] SR (Sandoz) (POM)

Tablets, m/r, tramadol hydrochloride 100 mg, net price 60-tab pack = £18.25; 150 mg, 60-tab pack = £27.35; 200 mg, 60-tab pack = £36.50. Label: 2, 25

Dose

Moderate to severe pain

- By mouth

Child 12–18 years initially 100 mg twice daily increased if necessary; usual max. 200 mg twice daily

◻ TRAMADOL HYDROCHLORIDE (continued)

Mabron® (Morningside) (POM)

Tablets, m/r, tramadol hydrochloride 100 mg, net price 60-tab pack = £18.26; 150 mg, 60-tab pack = £27.39; 200 mg, 60-tab pack = £36.52. Label: 2, 25

Dose

Moderate to severe pain

• By mouth

Child 12–18 years 100 mg twice daily increased if necessary; usual max. 200 mg twice daily

Maxitram SR® (Chiesi) (POM)

Capsules, m/r, tramadol hydrochloride 50 mg (white), net price 60-cap pack = £4.55; 100 mg (yellow), 60-cap pack = £12.14; 150 mg (yellow), 60-cap pack = £18.21; 200 mg (yellow), 60-cap pack = £24.28. Label: 2, 25

Dose

Moderate to severe pain

• By mouth

Child 12–18 years initially 100 mg twice daily increased if necessary; usual max. 200 mg twice daily

Tramquel SR® (Meda) (POM)

Capsules, m/r, tramadol hydrochloride 50 mg (dark green), net price 60-cap pack = £7.64; 100 mg (white), 60-cap pack = £15.28; 150 mg (dark green), 60-cap pack = £22.92; 200 mg (yellow), 60-cap pack = £30.55. Label: 2, counselling, administration

Dose

Moderate to severe pain

• By mouth

Child 12–18 years 50–100 mg twice daily increased if necessary; usual max. 200 mg twice daily

Administration Swallow whole or open capsule and swallow contents immediately without chewing

Zamadol® SR (Meda) (POM)

Capsules, m/r, tramadol hydrochloride 50 mg (green), net price 60-cap pack = £7.64; 100 mg, 60-cap pack = £15.28; 150 mg (dark green), 60-cap pack = £22.92; 200 mg (yellow), 60-cap pack = £30.55. Label: 2, counselling, administration

Dose

Moderate to severe pain

• By mouth

Child 12–18 years 50–100 mg twice daily increased if necessary to 150–200 mg twice daily; total of more than 400 mg daily not usually required

Administration Swallow whole or open capsule and swallow contents immediately without chewing

Zeridame® SR (Actavis) (POM)

Tablets, m/r, tramadol hydrochloride 100 mg, net price 60-tab pack = £18.26; 150 mg, 60-tab pack = £27.39; 200 mg, 60-tab pack = £36.52. Label: 2, 25

Dose

Moderate to severe pain

• By mouth

Child 12–18 years 100 mg twice daily, increased if necessary; usual max. 200 mg twice daily

Zydol SR® (Grünenthal) (POM)

Tablets, m/r, f/c, tramadol hydrochloride 100 mg, net price 60-tab pack = £18.26; 150 mg (beige), 60-tab pack = £27.39; 200 mg (orange), 60-tab pack = £36.52. Label: 2, 25

Dose

Moderate to severe pain

• By mouth

Child 12–18 years 100 mg twice daily increased if necessary to 150–200 mg twice daily; total of more than 400 mg daily not usually required

◀ Modified-release 24-hourly preparations

Tradorec XL® (Labopharm) (POM)

Tablets, m/r, tramadol hydrochloride 100 mg, net price 30-tab pack = £14.10; 200 mg, 30-tab pack = £14.98; 300 mg, 30-tab pack = £22.47. Label: 2, 25

Dose

Moderate to severe pain

• By mouth

Child 12–18 years initially 100 mg once daily, increased if necessary to max. 400 mg once daily

Zamadol® 24hr (Meda) (POM)

Tablets, f/c, m/r, tramadol hydrochloride 150 mg, net price 28-tab pack = £10.70; 200 mg, 28-tab pack = £14.26; 300 mg, 28-tab pack = £21.39; 400 mg, 28-tab pack = £28.51. Label: 2, 25

Dose

Moderate to severe pain

• By mouth

Child 12–18 years initially 150 mg once daily increased if necessary; max. 400 mg once daily

Zydol XL® (Grünenthal) (POM)

Tablets, m/r, f/c, tramadol hydrochloride 150 mg, net price 30-tab pack = £15.22; 200 mg, 30-tab pack = £20.29; 300 mg, 30-tab pack = £30.44; 400 mg, 30-tab pack = £40.59. Label: 2, 25

Dose

Moderate to severe pain

• By mouth

Child 12–18 years 150 mg once daily increased if necessary; more than 400 mg once daily not usually required

◀ With paracetamol

Tramacet (Janssen-Cilag) (POM)

Tablets, f/c, yellow, tramadol hydrochloride 37.5 mg, paracetamol 325 mg, net price 60-tab pack = £10.07. Label: 2, 25, 29, 30

Dose

Moderate to severe pain

• By mouth

Child 12–18 years 2 tablets not more than every 6 hours; max. 8 tablets daily

4.7.3 Neuropathic pain

Neuropathic pain, which occurs as a result of damage to neural tissue, includes *postherpetic neuralgia*, *phantom limb pain*, *complex regional pain syndrome* (reflex sympathetic dystrophy, causalgia) *compression neuropathies*, *peripheral neuropathies* (e.g. due to diabetes, haematological malignancies, rheumatoid arthritis, alcoholism, drug misuse), *trauma*, *central pain* (e.g. pain following stroke, spinal cord injury and syringomyelia) and *idiopathic neuropathy*. The pain occurs in an area of sensory deficit and may be described as burning, shooting or scalding and is often accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Neuropathic pain is generally managed with a tricyclic antidepressant such as amitriptyline (p.229) or antiepileptic drugs such as carbamazepine (p.267). Neuropathic pain may respond only partially to opioid analgesics. Nerve blocks, transcutaneous electrical nerve stimulation (TENS) and, in selected cases, central electrical stimulation may help. Many children with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support. A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain.

For the management of neuropathic pain in *palliative care*, see p. 25.

Chronic facial pain Chronic oral and facial pain including persistent idiopathic facial pain (also termed 'atypical facial pain') and temporomandibular dysfunction (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. Tricyclic antidepressants (section 4.3.1) may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners' List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Children on long-term therapy need to be monitored both for progress and for side-effects.

4.7.4 Antimigraine drugs

4.7.4.1 Treatment of acute migraine

4.7.4.2 Prophylaxis of migraine

4.7.4.3 Cluster headache

4.7.4.1 Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A **simple analgesic** such as paracetamol (preferably in a soluble or dispersible form) or an NSAID, usually ibuprofen, is often effective; concomitant **antiemetic** treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as the 5HT_{1B} agonist **sumatriptan**. **Ergot alkaloids** are associated with many side-effects and should be avoided.

Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT_{1B} agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

Analgesics

ANALGESICS

Paracetamol

Section 4.7.1

Non-steroidal anti-inflammatory drugs (NSAIDs)

Section 10.1.1

With antiemetics

Migraleve® (McNeil) 

Tablets, all f/c, pink tablets, buclizine hydrochloride 6.25 mg, paracetamol 500 mg, codeine phosphate

8 mg; yellow tablets, paracetamol 500 mg, codeine phosphate 8 mg. Net price 48-tab *Migraleve* (POM) (32 pink + 16 yellow) = £5.10; 48 pink (*Migraleve Pink*) = £5.56. Label: 2, (*Migraleve Pink*), 17, 30

Dose

Treatment of acute migraine

• By mouth

Child under 10 years only under close medical supervision

ANALGESICS (continued)

Child 10–14 years 1 pink tablet at onset of attack, or if it is imminent then 1 yellow tablet every 4 hours if necessary; max. 1 pink and 3 yellow tablets in 24 hours

Child 14–18 years 2 pink tablets at onset of attack, or if it is imminent, then 2 yellow tablets every 4 hours if necessary; max. in 24 hours 2 pink and 6 yellow

Paramax® (Sanofi-Synthelabo) (POM)

Tablets, scored, paracetamol 500 mg, metoclopramide hydrochloride 5 mg. Net price 42-tab pack = £8.03. Label: 17, 30

Sachets, effervescent powder, sugar-free, the contents of 1 sachet = 1 tablet; to be dissolved in ¼ tumblerful of liquid before administration. Net price 42-sachet pack = £10.43. Label: 13, 17, 30

Dose

Treatment of acute migraine

• By mouth

Child 12–18 years 1 at onset of attack then 1 every 4 hours when necessary to max. of 3 in 24 hours (max. dose of metoclopramide 500 micrograms/kg daily)

Important Metoclopramide can cause **severe extrapyramidal effects** (for further details, see p. 238 and p. 242)

5HT₁ agonists

5HT₁ agonists are used in the treatment of acute migraine attacks; treatment of children should be initiated by a specialist. The 5HT₁ agonists ('triptans') act on the 5HT (serotonin) 1B/1D receptors and they are therefore sometimes referred to as 5HT_{1B/1D}-receptor agonists. A 5HT₁ agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics.

Sumatriptan is used for migraine in children and it may also be of value in cluster headache (section 4.7.4.3).

SUMATRIPTAN

Cautions pre-existing cardiac disease; history of seizures; 5HT₁ agonists are recommended as monotherapy and should not be taken concurrently with other therapies for acute migraine; sensitivity to sulphonamides; **interactions:**

Appendix 1 (5HT₁ agonists)

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving)

Hepatic impairment reduce dose of oral therapy; avoid in severe impairment

Renal impairment manufacturer advises caution

Pregnancy limited experience—avoid unless potential benefit outweighs risk

Breast-feeding present in milk but not known to be harmful; withhold breast-feeding for 12 hours

Contra-indications vasospasm; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease; moderate and severe hypertension

Side-effects nausea, vomiting; sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis), transient increase in blood pressure, flushing; drowsiness, dizziness, weakness; *very rarely* ischaemic colitis, hypotension, bradycardia or tachycardia, palpitation, arrhythmias, myocardial infarction, Raynaud's syndrome, seizures, tremor, dystonia, nystagmus, and visual disturbances; nasal irritation and epistaxis with nasal spray

Licensed use tablets not licensed for use in children

Indication and dose

Treatment of acute migraine

• By mouth

Child 6–10 years 25 mg as a single dose, repeated once after at least 2 hours if migraine recurs

Child 10–12 years 50 mg as a single dose, repeated once after at least 2 hours if migraine recurs

Child 12–18 years 50–100 mg as a single dose, repeated once after at least 2 hours if migraine recurs

• Intranasally

Child 12–18 years 10–20 mg as a single dose, repeated once after at least 2 hours if migraine recurs; max. 40 mg in 24 hours

Note Child not responding to initial dose should not take second dose for same attack

¹Sumatriptan (Non-proprietary) (POM)

Tablets, sumatriptan (as succinate) 50 mg, net price 6-tab pack = £9.09; 100 mg, 6-tab pack = £13.77. Label: 3, 10, patient information leaflet

1. Sumatriptan 50 mg tablets can be sold to the public to treat previously diagnosed migraine; max. daily dose 100 mg

Imigran® (GSK) (POM)

Tablets, sumatriptan (as succinate) 50 mg, net price 6-tab pack = £27.62, 12-tab pack = £52.48; 100 mg, 6-tab pack = £44.64, 12-tab pack = £89.28. Label: 3, 10, patient information leaflet

Nasal spray, sumatriptan 10 mg/0.1-mL actuation, net price 2 unit-dose spray device = £12.28; 20 mg/0.1-mL actuation, 2 unit-dose spray device = £12.28, 6 unit-dose spray device = £36.83. Label: 3, 10, patient information leaflet

◊ SUMATRIPTAN (continued)

Imigran Radis[®] (GSK) (POM)

Tablets, f/c, sumatriptan (as succinate) 50 mg (pink), net price 6-tab pack = £24.87, 12-tab pack =

£49.77; 100 mg (white), 6-tab pack = £44.64, 12-tab pack = £89.28. Label: 3, 10, patient information leaflet

Antiemetics

Antiemetics (section 4.6), including **metoclopramide**, **domperidone**, phenothiazines, and antihistamines, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem. Metoclopramide and domperidone have the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms (**important**: for warnings relating to extrapyramidal effects of metoclopramide see p. 238 and p. 242).

4.7.4.2 Prophylaxis of migraine

Where migraine attacks are frequent, possible provoking factors such as stress should be sought; combined oral contraceptives may also provoke migraine. Preventive treatment should be considered if migraine attacks interfere with school and social life, particularly for children who:

- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.

In children it is often possible to stop prophylaxis after a period of treatment.

Propranolol (section 2.4) may be effective in preventing migraine in children but it is contra-indicated in those with asthma. Side-effects such as depression and postural hypotension can further limit its use.

Pizotifen, an antihistamine and serotonin antagonist, taken at night or twice daily, may also be used but its efficacy in children has not been clearly established. Common side-effects include drowsiness and weight gain.

Topiramate (section 4.8.1) is licensed for migraine prophylaxis. Treatment should be supervised by a specialist.

PIZOTIFEN

Cautions urinary retention; susceptibility to angle-closure glaucoma, renal impairment; **interactions**: Appendix 1 (pizotifen)

Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding amount probably too small to be harmful but manufacturer advises avoid

Side-effects antimuscarinic effects, drowsiness, increased appetite and weight gain; occasionally nausea, dizziness; *rarely* anxiety, aggression and depression; CNS stimulation may occur

Licensed use *Sanomigran*[®] elixir and 500-microgram tablets not licensed for use in children under 2 years; 1.5-mg tablets not licensed for use in children

Indication and dose

Prophylaxis of migraine

- By mouth

Child 5–10 years initially 500 micrograms at night increased according to response up to

500 micrograms 3 times daily; max. single dose at night 1 mg; max. 1.5 mg in 24 hours

Child 10–12 years initially 1 mg at night increased according to response up to 500 micrograms 3 times daily; max. single dose at night 1 mg; max. 1.5 mg in 24 hours

Child 12–18 years initially 1.5 mg at night increased according to response to 1.5 mg 3 times daily; max. single dose 3 mg; max. 4.5 mg in 24 hours

Pizotifen (Non-proprietary) (POM)

Tablets, pizotifen (as hydrogen malate), 500 micrograms, net price 28-tab pack = £1.37; 1.5 mg, 28-tab pack = £2.75. Label: 2

Sanomigran[®] (Novartis) (POM)

Tablets, both ivory-yellow, s/c, pizotifen (as hydrogen malate), 500 micrograms, net price 60-tab pack = £2.57; 1.5 mg, 28-tab pack = £4.28. Label: 2

Elixir, pizotifen (as hydrogen malate) 250 micrograms/5 mL, net price 300 mL = £4.51. Label: 2

4.7.4.3 Cluster headache

Cluster headache rarely responds to standard analgesics. **Sumatriptan** given by subcutaneous injection is the drug of choice for the *treatment* of cluster headache; treatment should be initiated by a specialist. Alternatively, 100% **oxygen** at a rate of 7–12 litres/minute is useful in aborting an attack.

4.8 Antiepileptics

4.8.1 Control of epilepsy

4.8.2 Drugs used in status epilepticus

4.8.3 Febrile convulsions

4.8.1 Control of epilepsy

The decision about when to start treatment with an antiepileptic drug and the choice of medication depend on frequency of seizures, neurological findings, the identification of an epilepsy syndrome, and the wishes of the child and carers. For the majority of children, epilepsy is controlled with a single antiepileptic drug.

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug to use, the seizure type, concomitant medication, co-morbidity, age, and sex should be taken into account. For women of child-bearing age, see Pregnancy and Breast-feeding, p. 266.

The frequency of administration is often determined by the plasma half-life, and should be kept as low as possible to encourage better adherence. Most antiepileptics, when used in usual dosage, may be given twice daily. Lamotrigine, phenobarbital and phenytoin, which have long half-lives, can be given as a daily dose at bedtime. However, with large doses, some antiepileptics may need to be given 3 times daily to avoid adverse effects associated with high peak plasma-drug concentrations. Young children metabolise antiepileptics more rapidly than adults and therefore require more frequent doses and a higher amount per kilogram body-weight.

Management When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried. The changeover from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with 2 or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs may increase adverse effects and the risk of drug interactions (see below). If combination therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy.

Interactions Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by *hepatic enzyme induction* or *hepatic enzyme inhibition*; *displacement from protein binding sites* is not usually a problem. These interactions are highly variable and unpredictable.

Significant interactions that occur **between antiepileptics** themselves are as follows:

Note Check under each drug for possible interactions when two or more antiepileptic drugs are used

Carbamazepine

often lowers plasma concentration of clobazam, clonazepam, lamotrigine, an active metabolite of oxcarbazepine, and of phenytoin (but may also raise phenytoin concentration), tiagabine, topiramate, and valproate

sometimes lowers plasma concentration of ethosuximide, and primidone (but tendency for corresponding increase in plasma-phenobarbital concentration)

Ethosuximide

sometimes raises plasma concentration of phenytoin

Gabapentin

no interactions with gabapentin reported

Lamotrigine

sometimes raises plasma concentration of an active metabolite of carbamazepine (but evidence is conflicting)

Levetiracetam

no interactions with levetiracetam reported

Oxcarbazepine

sometimes lowers plasma concentration of carbamazepine (but may raise concentration of an active metabolite of carbamazepine)

sometimes raises plasma concentration of phenytoin

often raises plasma concentration of phenobarbital

Phenobarbital or Primidone

often lowers plasma concentration of carbamazepine, clonazepam, lamotrigine, an active metabolite of oxcarbazepine, and of phenytoin (but may also raise phenytoin concentration), tiagabine, and valproate

sometimes lowers plasma concentration of ethosuximide

Phenytoin

often lowers plasma concentration of clonazepam, carbamazepine, lamotrigine, an active metabolite of oxcarbazepine, and of tiagabine, topiramate, and valproate

often raises plasma concentration of phenobarbital

sometimes lowers plasma concentration of ethosuximide, and primidone (by increasing conversion to phenobarbital)

Stiripentol

often raises plasma concentration of carbamazepine, clobazam, phenobarbital, and phenytoin

Topiramate

sometimes raises plasma concentration of phenytoin

Valproate

sometimes lowers plasma concentration of an active metabolite of oxcarbazepine

often raises plasma concentration of an active metabolite of carbamazepine, and of lamotrigine, primidone, phenobarbital, and phenytoin (but may also lower)

sometimes raises plasma concentration of ethosuximide, and primidone (and tendency for significant increase in plasma-phenobarbital concentration)

Vigabatrin

often lowers plasma concentration of phenytoin

sometimes lowers plasma concentration of phenobarbital and primidone

For other important interactions see **Appendix 1**; for advice on hormonal contraception and enzyme-inducing drugs (including antiepileptics), see section 7.3.1 and section 7.3.2.

Withdrawal Antiepileptics should be withdrawn under specialist supervision. Abrupt withdrawal, particularly of the barbiturates and benzodiazepines, should be avoided because this may precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, the withdrawal process may take months.

The decision to withdraw antiepileptics from a seizure-free child, and its timing, depends on individual circumstances such as the type of epilepsy and its cause. Even in children who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal.

Drugs should be gradually withdrawn over at least 2–3 months by reducing the daily dose by 10–25% at intervals of 1–2 weeks. Benzodiazepines may need to be withdrawn over 6 months or longer.

In children receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

Monitoring Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma-drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected non-compliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should only be undertaken if clinically indicated.

Driving Older children suffering from epilepsy may drive a motor vehicle provided that they have been seizure-free for one year or, if subject to attacks only while asleep, have established a 3-year period of asleep attacks without awake attacks. Those affected by drowsiness should not drive or operate machinery.

Guidance issued by the Drivers Medical Unit of the Driver and Vehicle Licensing Agency (DVLA) recommends that patients should be advised not to drive during withdrawal of antiepileptic drugs, or for 6 months afterwards.

Pregnancy and breast-feeding There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if the child takes two or more antiepileptic drugs). However, the benefit of antiepileptic treatment usually outweighs the potential teratogenic risk, and treatment should not be stopped during pregnancy without discussing with a specialist (see also under individual drugs). In view of the increased risk of neural tube and other defects associated, in particular, with **carbamazepine**, **lamotrigine**, **oxcarbazepine**, **phenytoin**, and **valproate**, women taking antiepileptic drugs who *may become pregnant* should be **informed of the possible consequences**. Those who *wish to become pregnant* should be referred to an appropriate specialist for advice. Young women who become pregnant should be **counselled** and offered **antenatal screening** (including alpha-fetoprotein measurement and a second trimester ultrasound scan).

To counteract the risk of neural tube defects adequate folate supplements are advised for women before and during pregnancy; to prevent recurrence of neural tube defects, women should receive folic acid 5 mg daily (section 9.1.2)—this dose may also be appropriate for women receiving antiepileptic drugs.

The concentration of antiepileptic drugs in the blood can change during pregnancy, particularly in the later stages. The dose of antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

Routine injection of vitamin K (section 9.6.6) at birth effectively counteracts any antiepileptic-associated risk of neonatal haemorrhage.

Breast-feeding is acceptable with all antiepileptic drugs, taken in normal doses, with the possible exception of the barbiturates, and also some of the more recently introduced ones, see under individual drugs.

Partial seizures with or without secondary generalisation

Carbamazepine, **lamotrigine**, **oxcarbazepine**, and **sodium valproate** are the drugs of choice for partial (focal) seizures; second-line drugs include clobazam, gabapentin, levetiracetam, tiagabine, and topiramate.

Generalised seizures

Tonic-clonic seizures The drugs of choice for tonic-clonic seizures are **carbamazepine**, **lamotrigine**, **levetiracetam**, and **sodium valproate**. For children who have tonic-clonic seizures as part of the syndrome of primary generalised epilepsy, **sodium valproate** is the drug of choice. Second-line drugs include clobazam, oxcarbazepine, and topiramate.

Absence seizures **Ethosuximide** and **sodium valproate** are the drugs of choice in typical absence seizures; **lamotrigine** can be used if these are unsuitable. Sodium valproate is also highly effective in treating the generalised tonic-clonic seizures which may co-exist with absence seizures in idiopathic primary generalised epilepsy.

Myoclonic seizures Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. **Sodium valproate** is the drug of choice and **clobazam**, **clonazepam**, **ethosuximide**, **lamotrigine**, **levetiracetam**, or **topiramate** are second-line drugs for treating myoclonic seizures.

Atypical absence, atonic, and tonic seizures *Atypical absence* and *atonic seizures* may be managed with **sodium valproate**, **lamotrigine**, or **ethosuximide**. *Tonic seizures* may be treated with **sodium valproate**. Second-line drugs for atypical absence, atonic, and tonic seizures include clobazam, clonazepam, levetiracetam, and topiramate; tonic seizures may rarely be aggravated by benzodiazepines.

Epilepsy syndromes

Infantile spasms **Vigabatrin** is the drug of choice for infantile spasms associated with tuberous sclerosis. In spasms of other causes, high doses of corticosteroids such as **prednisolone** (section 6.3.2) or **tetracosactide** (section 6.5.1) may be more effective. Second-line alternatives include clobazam, clonazepam, sodium valproate, and topiramate; nitrazepam is used but it is sedating.

Lennox-Gastaut syndrome **Lamotrigine**, **sodium valproate**, and **topiramate** are first-line drugs for treating Lennox-Gastaut syndrome. Clobazam, clonazepam, ethosuximide, levetiracetam, and rufinamide are also used.

Landau-Kleffner syndrome **Prednisolone**, **lamotrigine**, and **sodium valproate** are commonly used to treat Landau-Kleffner syndrome. Alternatives include clobazam, levetiracetam and topiramate.

Neonatal seizures Seizures can occur before delivery, but they are most common up to 24 hours after birth. Seizures in neonates occur as a result of biochemical disturbances, inborn errors of metabolism, hypoxic ischaemic encephalopathy, drug withdrawal, severe jaundice (kernicterus), meningitis, stroke, or cerebral haemorrhage or malformation.

Seizures caused by biochemical imbalance and those in neonates with inherited abnormal pyridoxine or biotin metabolism should be corrected by treating the underlying cause (section 9.6.2). Seizures caused by drug withdrawal following intra-uterine exposure are treated with a drug withdrawal regimen.

Phenobarbital may be preferred when there is a risk of seizure recurrence in neonates; phenytoin is an alternative. The benzodiazepines (clonazepam, diazepam, lorazepam, and midazolam) and rectal paraldehyde may be useful in the management of seizures which are likely to be brief with little risk of recurrence.

Carbamazepine and oxcarbazepine

Carbamazepine is a drug of choice for simple and complex partial seizures and for tonic-clonic seizures secondary to a focal discharge. It can exacerbate myoclonic and absence seizures. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly in small increments every 3–7 days. Reversible blurring of vision, dizziness, and unsteadiness are dose-related, and may be dose-limiting. These side-effects may be reduced by altering the timing of medication; use of modified-release tablets also significantly lessens the incidence of dose-related side-effects.

Oxcarbazepine may be used for the treatment of partial seizures with or without secondarily generalised tonic-clonic seizures. Oxcarbazepine induces hepatic enzymes to a lesser extent than carbamazepine.

CARBAMAZEPINE

Cautions cardiac disease (see also Contra-indications); skin reactions (see also Blood, Hepatic or Skin disorders, below and under Side-effects); test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin—risk of Stevens-Johnson syndrome in the presence of HLA-B*1502 allele;

history of haematological reactions to other drugs; manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value unsatisfactory); may exacerbate absence and myoclonic seizures; susceptibility to angle-closure glaucoma; avoid abrupt with-

▢ CARBAMAZEPINE (continued)

drawal; **interactions:** see p. 264 and Appendix 1 (carbamazepine)

Hepatic impairment metabolism impaired in advanced liver disease

Renal impairment manufacturer advises caution

Pregnancy see Pregnancy and Breast-feeding, p. 266

Breast-feeding see notes above; amount probably too small to be harmful

Blood, hepatic or skin disorders Children or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia which is severe, progressive or associated with clinical symptoms requires withdrawal (if necessary under cover of suitable alternative).

Contra-indications AV conduction abnormalities (unless paced); history of bone marrow depression, acute porphyria (section 9.8.2)

Side-effects nausea and vomiting, dizziness, drowsiness, headache, ataxia, confusion and agitation, visual disturbances (especially diplopia and often associated with peak plasma concentrations); constipation or diarrhoea, anorexia; mild transient generalised erythematous rash may occur in a large number of children (withdraw if worsens or is accompanied by other symptoms); leucopenia and other blood disorders (including thrombocytopenia, agranulocytosis and aplastic anaemia); other side-effects include cholestatic jaundice, hepatitis and acute renal failure, Stevens-Johnson syndrome, toxic epidermal necrolysis, alopecia, thromboembolism, arthralgia, fever, proteinuria, lymph node enlargement, cardiac conduction disturbances (sometimes arrhythmias), dyskinesias, paraesthesia, depression, impotence (and impaired fertility), gynaecomastia, galactorrhoea, aggression, activation of psychosis; photosensitivity, pulmonary hypersensitivity (with dyspnoea and pneumonitis), hyponatraemia, oedema, and disturbances of bone metabolism (with osteomalacia) also reported; suicidal ideation; suppositories may cause occasional rectal irritation

Pharmacokinetics plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks

Licensed use licensed for use in children with generalised tonic-clonic and partial seizures only

Indication and dose

Partial and generalised tonic-clonic seizures, neuropathic pain, some movement disorders (e.g. paroxysmal kinesigenic choreoathetosis), mood stabilisation

• By mouth

Child 1 month–12 years initially 5 mg/kg at night or 2.5 mg/kg twice daily, increased as necessary by 2.5–5 mg/kg every 3–7 days; usual maintenance dose 5 mg/kg 2–3 times daily; doses up to 20 mg/kg daily have been used

Child 12–18 years initially 100–200 mg 1–2 times daily, increased slowly to usual maintenance dose 200–400 mg 2–3 times daily; in some cases doses up to 1.8 g daily may be needed

• By rectum

Child 1 month–18 years use approx. 25% more than the oral dose (max. 250 mg) up to 4 times daily

Note Different preparations may vary in bioavailability; to avoid reduced effect or excessive side-effects, it may be prudent to avoid changing the formulation (see also notes above on how side-effects may be reduced)

Administration Oral liquid has been used rectally—should be retained for at least 2 hours (but may have laxative effect)

Carbamazepine (Non-proprietary) (Pom)

Tablets, carbamazepine 100 mg, net price 28 = £5.40; 200 mg, 28 = £4.71; 400 mg, 28 = £6.59. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Brands include *Epimaz*[®]

Dental prescribing on NHS Carbamazepine Tablets may be prescribed

Tegretol[®] (Novartis) (Pom)

Tablets, all scored, carbamazepine 100 mg, net price 84-tab pack = £2.43; 200 mg, 84-tab pack = £4.50; 400 mg, 56-tab pack = £5.90. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Chewtabs, orange, carbamazepine 100 mg, net price 56-tab pack = £3.72; 200 mg, 56-tab pack = £6.92. Label: 3, 8, 21, 24, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Liquid, sugar-free, carbamazepine 100 mg/5 mL. Net price 300-mL pack = £7.20. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Suppositories, carbamazepine 125 mg, net price 5 = £9.45; 250 mg, 5 = £12.60. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Dose

Epilepsy for short-term use (max. 7 days) when oral therapy temporarily not possible

Note Suppositories of 125 mg may be considered to be approximately equivalent in therapeutic effect to tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended); max. dose *by rectum* 250 mg 4 times daily

▀ Modified release

Carbagen[®] SR (Generics) (Pom)

Tablets, m/r, f/c, both scored, carbamazepine 200 mg, net price 56-tab pack = £4.88; 400 mg, 56-tab pack = £9.63. Label: 3, 8, 25, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Dose

Child 5–18 years as above; total daily dose given in 1–2 divided doses

▮ CARBAMAZEPINE (continued)

Tegretol® Retard (Novartis) (P_m)

Tablets, m/r, both scored, carbamazepine 200 mg (beige-orange), net price 56-tab pack = £5.52; 400 mg (brown-orange), 56-tab pack = £10.86. Label: 3, 8, 25, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Dose

Child 5–18 years as above; total daily dose given in 2 divided doses

Administration Tegretol® Retard tablets can be halved but should not be chewed

OXCARBAZEPINE

Cautions hypersensitivity to carbamazepine; avoid abrupt withdrawal; hyponatraemia (monitor plasma-sodium concentration in patients at risk), heart failure (monitor body-weight), cardiac conduction disorders; avoid in acute porphyria (section 9.8.2); **interactions:** see p. 264 and Appendix 1 (oxcarbazepine)

Hepatic impairment manufacturer advises caution in severe impairment—no information available

Renal impairment use half initial dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², increased according to response at intervals of at least 1 week

Pregnancy see Pregnancy and Breast-feeding, p. 266

Breast-feeding present in milk; amount probably too small to be harmful but manufacturer advises avoid

Blood, hepatic or skin disorders Children or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, sore throat, rash, blistering, mouth ulcers, bruising, or bleeding develop

Side-effects nausea, vomiting, constipation, diarrhoea, abdominal pain, dizziness, headache, drowsiness, agitation, amnesia, asthenia, ataxia, confusion, impaired concentration, depression, tremor, hyponatraemia, acne, alopecia, rash, nystagmus, visual disorders including diplopia; *less commonly* urticaria, leucopenia; *very rarely* hepatitis, pancreatitis, arrhythmias, hypersensitivity reactions, thrombocytopenia, systemic lupus erythematosus, Stevens-Johnson syndrome, and toxic epidermal necrolysis; suicidal ideation

Indication and dose

Monotherapy and adjunctive therapy of partial seizures with or without secondarily generalised tonic-clonic seizures

• By mouth

Child 6–18 years initially 4–5 mg/kg (max. 300 mg) twice daily, increased according to response in steps of up to 5 mg/kg twice daily at weekly intervals (usual maintenance dose for adjunctive therapy 15 mg/kg twice daily); max. 23 mg/kg twice daily

Note In adjunctive therapy the dose of concomitant anti-epileptics may need to be reduced when using high doses of oxcarbazepine

Oxcarbazepine (Non-proprietary) (P_m)

Tablets, oxcarbazepine 150 mg, net price 50-tab pack = £10.00; 300 mg, 50-tab pack = £19.93; 600 mg, 50-tab pack = £39.48. Label: 3, 8, counselling, blood, hepatic or skin disorders (see above), driving (see notes above)

Trileptal® (Novartis) (P_m)

Tablets, f/c, scored, oxcarbazepine 150 mg (green), net price 50-tab pack = £10.00; 300 mg (yellow), 50-tab pack = £20.00; 600 mg (pink), 50-tab pack = £40.00. Label: 3, 8, counselling, blood, hepatic or skin disorders (see above), driving (see notes above)

Oral suspension, sugar-free, oxcarbazepine 300 mg/5 mL, net price 250 mL (with oral syringe) = £40.00. Label: 3, 8, counselling, blood, hepatic or skin disorders (see above), driving (see notes above)

Excipients include propylene glycol (see Excipients, p. 3)

Ethosuximide

Ethosuximide is used in typical absence seizures; it may also be used in myoclonic seizures and in atypical absence, atonic, and tonic seizures.

ETHOSUXIMIDE

Cautions avoid abrupt withdrawal; hepatic impairment; renal impairment; avoid in acute porphyria (section 9.8.2); **interactions:** see p. 264 and Appendix 1 (ethosuximide)

Pregnancy may be teratogenic but see Pregnancy and Breast-feeding, p. 266

Breast-feeding present in milk but unlikely to be harmful; manufacturer advises avoid

Blood disorders Children or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, sore throat, mouth ulcers, bruising, or bleeding develop

Side-effects gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, abdominal pain, and anorexia), weight loss; *less frequently* headache, fatigue, drowsiness, dizziness, hiccup, ataxia, mild euphoria, irritability, aggression, and impaired concentration; *rarely* tongue swelling, sleep disturbances, night terrors, depression, psychosis, photophobia, dyskinesia, increased libido, vaginal bleeding, myopia, gingival hypertrophy, and rash; also reported, hyperactivity, increase in seizure frequency, blood disorders such as leucopenia, agranulocytosis,

▮ ETHOSUXIMIDE (*continued*)

pancytopenia, and aplastic anaemia (blood counts required if features of infection), systemic lupus erythematosus, and Stevens-Johnson syndrome; suicidal ideation

Indication and dose

Absence seizures, atypical absence, myoclonic seizures

- **By mouth**

Child 1 month–6 years initially 5 mg/kg (max. 125 mg) twice daily, increased gradually over 2–3 weeks up to maintenance dose of 10–20 mg/kg (max. 500 mg) twice daily; total daily dose may rarely be given in 3 divided doses

Child 6–18 years initially 250 mg twice daily, increased by 250 mg at intervals of 4–7 days to usual dose of 500–750 mg twice daily; occasionally up to 1 g twice daily may be needed

Ethosuximide (Non-proprietary) (POM)

Capsules, ethosuximide 250 mg, net price 56-cap pack = £38.23. Label: 8, counselling, blood disorders (see above), driving (see notes above)

Emeside[®] (Chemidex) (POM)

Syrup, black currant, ethosuximide 250 mg/5 mL, net price 200-mL pack = £6.60. Label: 8, counselling, blood disorders (see above), driving (see notes above)

Zarontin[®] (Pfizer) (POM)

Syrup, yellow, ethosuximide 250 mg/5 mL, net price 200-mL pack = £4.48. Label: 8, counselling, blood disorders (see above), driving (see notes above)

Gabapentin

Gabapentin is used as adjunctive therapy for the treatment of partial seizures with or without secondary generalisation; it can be used as monotherapy in children over 12 years.

GABAPENTIN

Cautions avoid abrupt withdrawal (may cause anxiety, insomnia, nausea, pain, and sweating—taper off over at least 1 week); diabetes mellitus, false positive readings with some urinary protein tests; **interactions:** Appendix 1 (gabapentin)

Renal impairment reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m²; consult product literature

Pregnancy see Pregnancy and Breast-feeding, p. 266; toxicity in *animal studies*

Breast-feeding present in milk—manufacturer advises use only if potential benefit outweighs risk

Side-effects diarrhoea, dry mouth, dyspepsia, nausea, vomiting, constipation, abdominal pain, flatulence, appetite changes, gingivitis, weight gain; hypertension, vasodilation, oedema; dyspnoea, cough, rhinitis; confusion, depression, hostility, sleep disturbances, headache; dizziness, anxiety, amnesia, ataxia, dysarthria, nystagmus, tremor, asthenia, paraesthesia, hyperkinesia; influenza-like symptoms; impotence, urinary incontinence; leucopenia; myalgia, arthralgia; diplopia, amblyopia; rash, purpura, pruritus, acne; *rarely* pancreatitis, hepatitis, jaundice, palpitation, hallucinations, movement disorders, thrombocytopenia, blood-glucose fluctuations in patients with diabetes, tinnitus, acute renal failure, Stevens-Johnson syndrome, and alopecia; suicidal ideation

Licensed use not licensed for use in children under 6 years; not licensed at doses over 50 mg/kg daily in children under 12 years

Indication and dose

Adjunctive treatment of partial seizures with or without secondary generalisation

- **By mouth**

Child 2–6 years 10 mg/kg once daily on day 1, then 10 mg/kg twice daily on day 2, then 10 mg/kg 3 times daily on day 3, increased according to response to usual dose of 30–70 mg/kg daily in 3 divided doses

Child 6–12 years 10 mg/kg once daily (max. 300 mg) on day 1, then 10 mg/kg (max. 300 mg) twice daily on day 2, then 10 mg/kg (max. 300 mg) 3 times daily on day 3; usual dose 25–35 mg/kg daily in 3 divided doses; max. 70 mg/kg daily in 3 divided doses

Child 12–18 years 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times daily on day 3 or initially 300 mg 3 times daily on day 1; then increased according to response in steps of 300 mg daily (in 3 divided doses) every 2–3 days; usual dose 0.9–3.6 g daily in 3 divided doses

Monotherapy for partial seizures with or without secondary generalisation

- **By mouth**

Child 12–18 years 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times daily on day 3 or initially 300 mg 3 times daily on day 1; then increased according to response in steps of 300 mg daily (in 3 divided doses) every 2–3 days; usual dose 0.9–3.6 g daily in 3 divided doses

Note Some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

Administration capsules can be opened but the bitter taste is difficult to mask

▮ GABAPENTIN (continued)

Gabapentin (Non-proprietary) (P_M)

Capsules, gabapentin 100 mg, net price 100-cap pack = £5.78; 300 mg, 100-cap pack = £8.96; 400 mg, 100-cap pack = £9.24. Label: 3, 5, 8, counselling, driving (see notes above)

Tablets, gabapentin 600 mg, net price 100-tab pack = £106.00; 800 mg, 100-tab pack = £83.38. Label: 3, 5, 8, counselling, driving (see notes above)

Neurontin® (Pfizer) (P_M)

Capsules, gabapentin 100 mg (white), net price 100-cap pack = £22.86; 300 mg (yellow), 100-cap pack = £53.00; 400 mg (orange), 100-cap pack = £61.33. Label: 3, 5, 8, counselling, driving (see notes above)

Tablets, f/c, gabapentin 600 mg, net price 100-tab pack = £106.00; 800 mg, 100-tab pack = £122.66. Label: 3, 5, 8, counselling, driving (see notes above)

Lacosamide

Lacosamide is licensed for adjunctive treatment of partial seizures with or without secondary generalisation.

The *Scottish Medicines Consortium* (p. 4) has advised (January 2009) that lacosamide (*Vimpat*®) is accepted for restricted use within NHS Scotland as adjunctive treatment for partial seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.

LACOSAMIDE

Cautions conduction problems or severe cardiac disease (increased risk of PR-interval prolongation); **interactions:** Appendix 1 (lacosamide)

Hepatic impairment manufacturer advises caution in severe hepatic impairment—no information available

Renal impairment manufacturer advises caution; max. 250 mg daily if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m²

Pregnancy see Pregnancy and Breast-feeding, p. 266; manufacturer advises avoid unless potential benefit outweighs risks

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Contra-indications second- or third-degree AV block

Side-effects nausea, vomiting, flatulence, constipation; dizziness, headache, depression, diplopia, nystagmus, impaired coordination, impaired memory, cognitive disorder, drowsiness, tremor, asthenia, fatigue; pruritus; *less commonly* PR-interval prolongation; suicidal ideation

Indication and dose

Adjunctive treatment of partial seizures with or without secondary generalisation

- By intravenous infusion over 15–60 minutes (for up to 5 days) or by mouth

Child 16–18 years initially 50 mg twice daily, increased in steps of 50 mg twice daily every week to max. 200 mg twice daily

Administration for *intravenous infusion*, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9% or Compound Sodium Lactate solution

Vimpat® (UCB Pharma) (P_M)

Tablets, f/c, lacosamide 50 mg (pink), net price 14-tab pack = £9.01; 100 mg (yellow), 14-tab pack = £18.02, 56-tab pack = £72.08; 150 mg (salmon), 14-tab pack = £27.03, 56-tab pack £108.12; 200 mg (blue), 56-tab pack = £144.16. Label: 8, counselling, driving (see notes above)

Syrup, lacosamide 15 mg/mL, net price 200 mL = £38.61. Label: 8, counselling, driving (see notes above)

Excipients include aspartame (section 9.4.1)

Intravenous infusion, lacosamide 10 mg/mL net price 200-mg vial = £29.70

Electrolytes Na⁺ 2.6 mmol/200-mg vial

Lamotrigine

Lamotrigine is an antiepileptic for partial seizures and primary and secondarily generalised tonic-clonic seizures. It may be tried for atypical absence, atonic, and tonic seizures particularly in children with Lennox-Gastaut syndrome. Lamotrigine may cause serious skin rash; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration whereas the enzyme inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. Where the potential for interaction is not known, treatment should be initiated with lower doses such as those used with valproate.

LAMOTRIGINE

Cautions closely monitor and consider withdrawal if rash, fever, or signs of hypersensitivity syndrome develop; avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs; **interactions:** see p. 264 and Appendix 1 (lamotrigine)

Blood disorders The CSM has advised prescribers to be alert for symptoms and signs suggestive of bone-marrow failure such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression and pancytopenia have been associated rarely with lamotrigine

Hepatic impairment halve dose in moderate impairment; quarter dose in severe impairment

Renal impairment manufacturer advises caution in renal failure; metabolite may accumulate

Pregnancy see Pregnancy and Breast-feeding, p. 266; risk of teratogenesis

Breast-feeding present in milk, but limited data suggest no harmful effect on neonate

Side-effects rash (see Skin Reactions, below); hypersensitivity syndrome (possibly including rash, fever, lymphadenopathy, hepatic dysfunction, blood disorders, disseminated intravascular coagulation and multi-organ dysfunction); nausea, vomiting, diarrhoea, hepatic dysfunction; headache, fatigue, dizziness, sleep disturbances, tremor, movement disorders, agitation, confusion, hallucinations, occasional increase in seizure frequency; blood disorders (including leucopenia, thrombocytopenia, pancytopenia—see Blood Disorders, above); arthralgia; lupus erythematosus-like effect; photosensitivity; nystagmus, diplopia, blurred vision, conjunctivitis; suicidal ideation

Skin reactions Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (rarely with fatalities) have developed especially in children; most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome (see Side-effects, above) and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. The CSM has advised that factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

Counselling Warn children and their carers to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop

Indication and dose

Monotherapy and adjunctive treatment of partial seizures and primary and secondarily generalised tonic-clonic seizures; seizures associated with Lennox-Gastaut syndrome

- **By mouth**

Adjunctive therapy with valproate

Child 2–12 years initially 150 micrograms/kg once daily for 14 days (those weighing under 13 kg may receive 2 mg on alternate days for first 14 days) then 300 micrograms/kg once daily for further 14 days, thereafter increased by max. of 300 micrograms/kg daily every 7–14 days; usual maintenance 1–5 mg/kg daily in 1–2 divided doses (max. single dose 100 mg)

Child 12–18 years initially 25 mg on alternate days for 14 days then 25 mg daily for further 14 days, thereafter increased by max. 25–50 mg daily every 7–14 days; usual maintenance 100–200 mg daily in 1–2 divided doses

Adjunctive therapy (with enzyme inducing drugs) without valproate

Child 2–12 years initially 300 micrograms/kg twice daily for 14 days then 600 micrograms/kg twice daily for further 14 days, thereafter increased by max. 1.2 mg/kg daily every 7–14 days; usual maintenance 2.5–7.5 mg/kg (max. single dose 200 mg) twice daily

Child 12–18 years initially 50 mg daily for 14 days then 50 mg twice daily for further 14 days, thereafter increased by max. 100 mg daily every 7–14 days; usual maintenance 100–200 mg twice daily (up to 700 mg daily has been required)

Adjunctive therapy with oxcarbazepine

Child 2–12 years initially 300 micrograms/kg daily in 1–2 divided doses for 14 days then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, thereafter increased by max. 600 micrograms/kg daily every 7–14 days; usual maintenance 1–10 mg/kg daily in 1–2 divided doses; max. 200 mg daily

Child 12–18 years initially 25 mg daily for 14 days, increased to 50 mg daily for further 14 days, then increased by max. 50–100 mg daily every 7–14 days; usual maintenance 100–200 mg daily in 1–2 divided doses

Monotherapy

Child 12–18 years initially 25 mg daily for 14 days, increased to 50 mg daily for further 14 days, then increased by max. 50–100 mg daily every 7–14 days; usual maintenance as monotherapy, 100–200 mg daily in 1–2 divided doses (up to 500 mg daily has been required)

Note Dose titration should be repeated if restarting after interval of more than 5 days

Safe Practice Do not confuse the different combinations; see also notes above

Lamotrigine (Non-proprietary) (POM)

Tablets, lamotrigine 25 mg, net price 56-tab pack = £3.45; 50 mg, 56-tab pack = £4.13; 100 mg, 56-tab pack = £5.45; 200 mg, 30-tab pack = £27.53, 56-tab pack = £9.36. Label: 8, counselling, driving (see notes above), skin reactions (see above)

Dispersible tablets, lamotrigine 5 mg, net price 28-tab pack = £2.87; 25 mg, 56-tab pack = £3.87; 100 mg, 56-tab pack = £7.70. Label: 8, 13, counselling, driving (see notes above), skin reactions (see above)

Lamictal[®] (GSK) (POM)

Tablets, yellow, lamotrigine 25 mg, net price 21-tab pack ('Valproate Add-on therapy' Starter Pack) = £7.65, 42-tab pack ('Monotherapy' Starter Pack) = £15.30, 56-tab pack = £20.41; 50 mg, 42-tab pack ('Non-valproate Add-on therapy' Starter Pack) = £26.02, 56-tab pack = £34.70; 100 mg, 56-tab pack = £59.86; 200 mg, 56-tab pack = £101.76. Label: 8, counselling, driving (see notes above), skin reactions (see above)

◊ LAMOTRIGINE (continued)

Dispersible tablets, chewable, lamotrigine 2 mg, net price 30-tab pack = £ 8.71; 5 mg, 28-tab pack = £8.14; 25 mg, 56-tab pack = £20.41; 100 mg, 56-tab pack = £59.86. Label: 8, 13, counselling, driving (see notes above), skin reactions (see above)

Levetiracetam

Levetiracetam is used for monotherapy and adjunctive treatment of partial seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures and generalised tonic-clonic seizures.

LEVETIRACETAM

Cautions avoid abrupt withdrawal

Hepatic impairment halve dose in severe hepatic impairment if creatinine clearance less than 70 mL/minute/1.73 m²

Renal impairment reduce dose if estimated glomerular filtration is less than 80 mL/minute/1.73 m²

Pregnancy see Pregnancy and Breast-feeding, p. 266; manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies

Breast-feeding present in milk—manufacturer advises avoid; see also notes above

Side-effects nausea, vomiting, dyspepsia, diarrhoea, abdominal pain, anorexia, weight changes; cough; drowsiness, asthenia, amnesia, ataxia, seizures, dizziness, headache, tremor, hyperkinesia, depression, emotional lability, insomnia, anxiety, impaired balance and attention, aggression, irritability; thrombocytopenia; myalgia; visual disturbances; pruritus, rash; *also reported* pancreatitis, hepatic dysfunction, confusion, psychosis, hallucinations, suicidal ideation, paraesthesia, leucopenia, pancytopenia, and alopecia

Indication and dose

Monotherapy of partial seizures with or without secondary generalisation

• **By mouth or by intravenous infusion**

Child 16–18 years initially 250 mg once daily increased according to response in steps of 250 mg twice daily every 2 weeks; max. 1.5 g twice daily

Adjunctive treatment of partial seizures with or without secondary generalisation; adjunctive treatment of myoclonic seizures; adjunctive treatment of tonic-clonic seizures

• **By mouth or by intravenous infusion**

Child 4–18 years (12–18 years for myoclonic or tonic-clonic seizures), body-weight under 50 kg initially 10 mg/kg once daily, adjusted in steps not exceeding 10 mg/kg twice daily every 2 weeks; max. 30 mg/kg twice daily

Child 12–18 years, body-weight over 50 kg initially 250 mg twice daily, adjusted in steps of 500 mg twice daily every 2–4 weeks; max. 1.5 g twice daily

Administration for intravenous infusion, dilute requisite dose with at least 100 mL Glucose 5% or Sodium Chloride 0.9% or Compound Sodium Lactate solution; give over 15 minutes

For administration of oral solution, requisite dose may be diluted in a glass of water

Keppra[®] (UCB Pharma) (POM)

Tablets, f/c, levetiracetam 250 mg (blue), net price 60-tab pack = £29.70; 500 mg (yellow), 60-tab pack = £52.30; 750 mg (orange), 60-tab pack = £89.10; 1 g (white), 60-tab pack = £101.10. Label: 8

Oral solution, sugar-free, levetiracetam 100 mg/mL, net price 300 mL = £71.00. Label: 8

Concentrate for intravenous infusion, levetiracetam 100 mg/mL. For dilution before use. Net price 5-mL vial = £13.50

Electrolytes Na⁺ <0.5 mmol/vial

Phenobarbital and other barbiturates

Phenobarbital (phenobarbitone) is effective for tonic-clonic, partial seizures and neonatal seizures but may cause behavioural disturbances and hyperkinesia. It may be tried for atypical absence, atonic, and tonic seizures. Rebound seizures may be a problem on withdrawal. Monitoring plasma concentrations is less useful than with other drugs because tolerance occurs.

Primidone is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. It is used rarely in children.

PHENOBARBITAL

(Phenobarbitone)

Cautions see also notes above; debilitated; respiratory depression (avoid if severe); avoid abrupt

withdrawal (dependence with prolonged use); history of drug and alcohol abuse; avoid in acute

□ PHENOBARBITAL (*continued*)

porphyria (see section 9.8.2); **interactions:** see p. 264 and Appendix 1 (barbiturates)

Hepatic impairment may precipitate coma; avoid in severe impairment

Renal impairment use with caution

Pregnancy see Pregnancy and Breast-feeding, p. 266

Pregnancy and Breast-feeding avoid if possible; drowsiness may occur

Side-effects hepatitis, cholestasis; hypotension; respiratory depression; drowsiness, lethargy, depression, ataxia, behavioural disturbances, nystagmus, irritability, hallucinations, impaired memory and cognition, hyperactivity; osteomalacia; megaloblastic anaemia (may be treated with folic acid), agranulocytosis, thrombocytopenia; allergic skin reactions; *very rarely* Stevens-Johnson syndrome and toxic epidermal necrolysis; suicidal ideation; **overdosage:** see Emergency Treatment of Poisoning, p. 35

Pharmacokinetics trough plasma concentration for optimum response 15–40 mg/litre (60–180 micromol/litre)

Indication and dose

All forms of epilepsy except absence seizures

- By mouth or by intravenous injection

Neonate initially 20 mg/kg by slow intravenous injection then 2.5–5 mg/kg once daily either by slow intravenous injection or by mouth; dose and frequency adjusted according to response

- By mouth

Child 1 month–12 years initially 1–1.5 mg/kg twice daily, increased by 2 mg/kg daily as required; usual maintenance dose 2.5–4 mg/kg once or twice daily

Child 12–18 years 60–180 mg once daily

Status epilepticus section 4.8.2

Note For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect

Administration for administration by mouth, tablets may be crushed

For intravenous injection, dilute to a concentration of 20 mg/mL with Water for Injections; give over 20 minutes (no faster than 1 mg/kg/minute)

Phenobarbital (Non-proprietary) CD

Tablets, phenobarbital 15 mg, net price 28-tab pack = 88p; 30 mg, 28-tab pack = 59p; 60 mg, 28-tab pack = 69p. Label: 2, 8, counselling, driving (see notes above)

Elixir, phenobarbital 15 mg/5 mL in a suitable flavoured vehicle, containing alcohol 38%, net price 100 mL = 77p. Label: 2, 8, counselling, driving (see notes above)

Note Some hospitals supply alcohol-free formulations of varying phenobarbital strengths

Injection, phenobarbital sodium 200 mg/mL in propylene glycol 90% and water for injections 10%, net price 1-mL amp = £2.00

Note Must be diluted before intravenous administration (see Administration)

PRIMIDONE

Cautions see under Phenobarbital; **interactions:** see p. 264 and Appendix 1 (primidone)

Hepatic impairment reduce dose, may precipitate coma

Renal impairment see Phenobarbital

Pregnancy see Phenobarbital

Breast-feeding see Phenobarbital

Side-effects see under Phenobarbital; also nausea and visual disturbances; *less commonly* vomiting, headache, and dizziness; *rarely* arthralgia

Pharmacokinetics monitor plasma concentrations of derived phenobarbital. Optimum range as for phenobarbital

Indication and dose

All forms of epilepsy except absence seizures (but see notes above)

- By mouth

Child under 2 years initially 125 mg daily at bedtime, increased by 125 mg every 3 days according to response; usual maintenance, 125–250 mg twice daily

Child 2–5 years initially 125 mg daily at bedtime, increased by 125 mg every 3 days according to response; usual maintenance, 250–375 mg twice daily

Child 5–9 years initially 125 mg daily at bedtime, increased by 125 mg every 3 days according to response; usual maintenance, 375–500 mg twice a day

Child 9–18 years initially 125 mg daily at bedtime, increased by 125 mg every 3 days to 250 mg twice daily, then increased according to response by 250 mg every 3 days to max. 750 mg twice daily

Mysoline® (Acorus) POM

Tablets, scored, primidone 250 mg, net price 100-tab pack = £12.60. Label: 2, 8, counselling, driving (see notes above)

Phenytoin

Phenytoin is effective for tonic-clonic, partial, and neonatal seizures but it may worsen myoclonus. It has a narrow therapeutic index and the relationship between dose and plasma concentration is non-linear; small dosage increases in some children may produce large rises in plasma concentrations with acute

toxic side-effects. Monitoring of plasma concentration can assist dosage adjustment. A few missed doses or a small change in drug absorption may result in a marked change in plasma concentration.

Phenytoin may cause coarse facies, acne, hirsutism, and gingival hyperplasia and so may be particularly undesirable in adolescent patients.

When only parenteral administration is possible, **fosphenytoin** (section 4.8.2), a pro-drug of phenytoin, may be convenient to give. Whereas phenytoin can be given intravenously only, fosphenytoin may also be given by intramuscular injection.

PHENYTOIN

Cautions see notes above; avoid abrupt withdrawal; manufacturer recommends blood counts (but evidence of practical value unsatisfactory); avoid in acute porphyria (section 9.8.2); **interactions:** see p. 264 and Appendix 1 (phenytoin)

Hepatic impairment reduce dose

Pregnancy see Pregnancy and Breast-feeding, p. 266; changes in plasma protein binding may make interpretation of plasma-phenytoin concentrations difficult; increased doses may be required in the third trimester

Breast-feeding small amounts present in milk, but not known to be harmful

Blood or skin disorders Children and their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia which is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of suitable alternative)

Side-effects nausea, vomiting, constipation; insomnia, transient nervousness, tremor, paraesthesia, dizziness, headache, anorexia; gingival hypertrophy and tenderness; rash (discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence), acne, hirsutism, coarse facies; *rarely* hepatotoxicity, peripheral neuropathy, dyskinesia, lymphadenopathy, osteomalacia, blood disorders (including megaloblastic anaemia (may be treated with folic acid), leucopenia, thrombocytopenia, and aplastic anaemia), polyarteritis nodosa, lupus erythematosus, Stevens-Johnson syndrome, and toxic epidermal necrolysis; also reported pneumonitis and interstitial nephritis; suicidal ideation; *with excessive dosage* nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia

Pharmacokinetics therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding

Trough plasma concentration for optimum response:

Neonate–3 months, 6–15 mg/litre (25–60 micromol/litre)

Child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre)

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

All forms of epilepsy except absence seizures

- By intravenous injection (over 20–30 minutes) and by mouth

Neonate initial loading dose by *slow intravenous injection* (section 4.8.2) 18 mg/kg then by *mouth* 2.5–5 mg/kg twice daily adjusted according to response and plasma-phenytoin concentration (usual max. 7.5 mg/kg twice daily)

- By mouth

Child 1 month–12 years initially 1.5–2.5 mg/kg twice daily, then adjusted according to response and plasma-phenytoin concentration to 2.5–5 mg/kg twice daily (usual max. 7.5 mg/kg twice daily or 300 mg daily)

Child 12–18 years initially 75–150 mg twice daily then adjusted according to response and plasma-phenytoin concentration to 150–200 mg twice daily (usual max. 300 mg twice daily)

Status epilepticus, acute symptomatic seizures associated with head trauma or neurosurgery section 4.8.2

Administration for administration by *mouth*, interrupt enteral feeds for at least 1–2 hours before and after giving phenytoin; give with water to enhance absorption

For administration by *intravenous injection* and *intravenous infusion*, see p. 287

Phenytoin (Non-proprietary) (PmM)

Tablets, coated, phenytoin sodium 100 mg, net price 28-tab pack = £30.00. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)

Note On the basis of single dose tests there are no clinically relevant differences in bioavailability between available phenytoin sodium tablets and capsules but there may be a pharmacokinetic basis for maintaining the same brand of phenytoin in some patients

Epanutin® (Pfizer) (PmM)

Capsules, phenytoin sodium 25 mg (white/purple), net price 28-cap pack = 66p; 50 mg (white/pink), 28-cap pack = 67p; 100 mg (white/orange), 84-cap pack = £2.83; 300 mg (white/green), 28-cap pack = £2.83. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)

□ PHENYTOIN (continued)

Infatabs® (= chewable tablets), yellow, scored, phenytoin 50 mg, net price 112 = £7.38. Label: 8, 24, counselling, blood or skin disorder symptoms (see above), driving (see notes above)

Note Contain phenytoin 50 mg (as against phenytoin sodium) therefore care is needed on changing to capsules or tablets containing phenytoin sodium

Suspension, red, phenytoin 30 mg/5 mL, net price 500 mL = £4.27. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)

Note Suspension of phenytoin 90 mg in 15 mL may be considered to be approximately equivalent in therapeutic effect to capsules or tablets containing phenytoin sodium 100 mg, but nevertheless care is needed in making changes

■ Parenteral preparations

Section 4.8.2

Rufinamide

Rufinamide is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome.

The *Scottish Medicines Consortium* (p. 4) has advised (October 2008) that rufinamide (*Inovelon*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

RUFINAMIDE

Cautions closely monitor and consider withdrawal if rash, fever, or other signs of hypersensitivity syndrome (see Side-effects) develop; avoid abrupt withdrawal; **interactions:** see p. 264 and Appendix 1 (rufinamide)

Hepatic impairment manufacturer advises caution and careful dose titration in mild to moderate hepatic impairment and to avoid in severe impairment

Pregnancy see Pregnancy and Breast-feeding, p. 266; manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; effective contraception must be used during treatment

Contra-indications

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, constipation, diarrhoea, dyspepsia, abdominal pain; rhinitis, epistaxis; weight loss, anorexia, dizziness, headache, drowsiness, insomnia, anxiety, fatigue, increase in seizure frequency, impaired coordination, hyperactivity, tremor, gait disturbances; influenza-like symptoms; oligomenorrhoea; back pain; nystagmus, diplopia, blurred vision; rash, and acne; hypersensitivity syndrome (possibly including rash, fever, lymphadenopathy, hepatic dysfunction, haematuria, and multi-organ dysfunction) also reported

Hypersensitivity syndrome Serious hypersensitivity syndrome (see above) has developed especially in children and upon initiation of therapy; consider withdrawal if

rash or signs or symptoms of hypersensitivity syndrome develop

Counselling Warn children and their carers to seek immediate medical attention if signs or symptoms of hypersensitivity syndrome develop

Indication and dose

Adjunctive treatment of seizures in Lennox-Gastaut syndrome

• By mouth

Child 4–18 years body-weight less than 30 kg, initially 100 mg twice daily increased according to response in steps of 100 mg twice daily up to every 2 days; max. 500 mg twice daily (max. 300 mg twice daily if adjunctive therapy *with valproate*)

Child 4–18 years body-weight over 30 kg, initially 200 mg twice daily increased according to response in steps of 200 mg twice daily up to every 2 days; body-weight 30–50 kg max. 900 mg twice daily; body-weight 50–70 kg max. 1.2 g twice daily; body-weight over 70 kg max. 1.6 g twice daily

Administration Tablets may be crushed and given in half a glass of water

Inovelon® (Eisa) ▼ (PwM)

Tablets, pink, f/c, scored, rufinamide 100 mg, net price 10-tab pack = £8.58; 200 mg, 60-tab pack = £51.48; 400 mg, 60-tab pack = £85.80. Label: 21, counselling, driving (see notes above), hypersensitivity syndrome (see above)

Stiripentol

Stiripentol is licensed for use in combination with clobazam and valproate as adjunctive therapy of refractory generalised tonic-clonic seizures in children with severe myoclonic epilepsy in infancy (Dravet Syndrome). It should be used under specialist supervision.

STIRIPENTOL

Cautions perform full blood count and liver function tests prior to initiating treatment and every 6 months thereafter; monitor growth; **interactions:** Appendix 1 (stiripentol)

Pregnancy see Pregnancy and Breast-feeding, p. 266; manufacturer advises use only if the potential benefit outweighs risk

Breast-feeding present in milk in *animal* studies

Contra-indications history of psychosis

Hepatic impairment manufacturer advises avoid—no information available

Renal impairment manufacturer advises avoid—no information available

Side-effects nausea, vomiting; aggression, anorexia, ataxia, drowsiness, dystonia, hyperexcitability, hyperkinesia, hypotonia, irritability, sleep disorders, weight loss; neutropenia; *less commonly* fatigue, photosensitivity, rash, and urticaria

Indication and dose

Severe myoclonic epilepsy in infancy

- By mouth

Child 3–18 years initially 10 mg/kg in 2–3 divided doses; titrate dose over minimum of 3 days to max. 50 mg/kg/day in 2–3 divided doses

Diacomil® (Alan Pharmaceuticals) (PoM)

Capsules, stiripentol 250 mg (pink), net price 60-cap pack = £248.00; 500 mg (white), 60-cap pack = £493.00. Label: 1, 8, 21, counselling, administration

Powder, stiripentol 250 mg, net price 60-sachet pack = £284.00; 500 mg, 60-sachet pack = £493.00.

Label: 1, 8, 13, 21, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling Do not take with milk, dairy products, carbonated drinks, fruit juice, or with food or drink that contains caffeine

Tiagabine

Tiagabine is used as adjunctive treatment for partial seizures, with or without secondary generalisation.

TIAGABINE

Cautions avoid in acute porphyria (section 9.8.2); avoid abrupt withdrawal; **interactions:** Appendix 1 (tiagabine)

Hepatic impairment in mild to moderate impairment, initial maintenance dose is 5–10 mg 1–2 times daily; avoid in severe impairment

Pregnancy see Pregnancy and Breast-feeding, p. 266; no evidence of teratogenicity in *animal* studies, but manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid unless potential benefit outweighs risk

Driving May impair performance of skilled tasks (e.g. driving)

Side-effects diarrhoea; dizziness, tiredness, nervousness, tremor, impaired concentration, emotional lability, speech impairment; *rarely* confusion, depression, drowsiness, psychosis, non-convulsive status epilepticus, bruising, and visual disturbances; suicidal ideation; leucopenia also reported

Indication and dose

Adjunctive treatment with enzyme-inducing drugs for partial seizures with or without secondary generalisation not satisfactorily controlled by other antiepileptics

- By mouth

Child 12–18 years initially 5 mg twice daily for 1 week then increased at weekly intervals in steps of 5–10 mg daily; usual maintenance dose 30–45 mg daily in 2–3 divided doses (doses above 30 mg daily given in 3 divided doses)

Adjunctive treatment with non-enzyme-inducing drugs for partial seizures with or without secondary generalisation not satisfactorily controlled by other antiepileptics

- By mouth

Child 12–18 years initially 5 mg twice daily for 1 week then increased at weekly intervals in steps of 5–10 mg daily; initial maintenance dose 15–30 mg daily in 2–3 divided doses (doses above 30 mg daily given in 3 divided doses)

Gabitril® (Cephalon) (PoM)

Tablets, f/c, tiagabine (as hydrochloride) 5 mg, net price 100-tab pack = £43.37; 10 mg, 100-tab pack = £86.74; 15 mg, 100-tab pack = £130.11. Label: 21

Topiramate

Topiramate can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or partial seizures with or without secondary generalisation. It can also be used as adjunctive treatment for seizures associated with Lennox-Gastaut syndrome. Topiramate is also licensed for prophylaxis of migraine (section 4.7.4.2).

TOPIRAMATE

Cautions avoid abrupt withdrawal; ensure adequate hydration (especially if predisposition to nephrolithiasis or in strenuous activity or warm environment); avoid in acute porphyria (section 9.8.2); **interactions:** see p. 264 and Appendix 1 (topiramate)

Hepatic impairment use with caution—clearance may be decreased

Renal impairment longer time to steady-state plasma concentration

Pregnancy see Pregnancy and Breast-feeding, p. 266; manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies

Breast-feeding manufacturer advises avoid—present in milk

CSM advice Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. The CSM advises that if raised intra-ocular pressure occurs:

- seek specialist ophthalmological advice;
- use appropriate measures to reduce intra-ocular pressure;
- stop topiramate as rapidly as feasible

Side-effects nausea, abdominal pain, dyspepsia, diarrhoea, dry mouth, taste disturbances, weight loss, anorexia; paraesthesia, hypoaesthesia, headache, fatigue, dizziness, speech disorder, drowsiness, insomnia, impaired memory and concentration, anxiety, depression; visual disturbances; *less commonly* suicidal ideation; *rarely* reduced sweating, metabolic acidosis, and alopecia; *very rarely* leucopenia, thrombocytopenia, and serious skin reactions

Indication and dose

Monotherapy of generalised tonic-clonic seizures or partial seizures with or without secondary generalisation

• By mouth

Child 6–16 years initially 0.5–1 mg/kg at night for 1 week then increased in steps of 250–500 micrograms/kg twice daily at intervals of 1–2 weeks; usual dose 1.5–3 mg/kg twice daily; max. 7.5 mg/kg twice daily

Child 16–18 years initially 25 mg at night for 1 week then increased in steps of 12.5–25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily; max. 200 mg twice daily

Adjunctive treatment of generalised tonic-clonic seizures or partial seizures with or without secondary generalisation, adjunctive treatment of seizures in Lennox-Gastaut syndrome

• By mouth

Child 2–16 years initially 25 mg at night for 1 week then increased in steps of 0.5–1.5 mg/kg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily; max. 7.5 mg/kg twice daily

Child 16–18 years initially 25 mg at night for 1 week then increased in steps of 12.5–25 mg twice daily at intervals of 1–2 weeks; usual dose 100–200 mg twice daily; max. 400 mg twice daily

Migraine prophylaxis

• By mouth

Child 16–18 years initially 25 mg daily at night for 1 week then increased in steps of 25 mg daily at intervals of 1 week; usual dose 50–100 mg daily in 2 divided doses

Note If child cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used

Topamax® (Janssen-Cilag) ▼ (POM)

Tablets, f/c, topiramate 25 mg, net price 60-tab pack = £20.48; 50 mg (light yellow), 60-tab pack = £33.64; 100 mg (yellow), 60-tab pack = £60.26; 200 mg (salmon), 60-tab pack = £117.02. Label: 3, 8, counselling, driving (see notes above)

Sprinkle capsules, topiramate 15 mg, net price 60-cap pack = £15.70; 25 mg, 60-cap pack = £23.55; 50 mg, 60-cap pack = £38.69. Label: 3, 8, counselling, administration, driving (see notes above)

Counselling Swallow whole or open capsule and sprinkle contents on soft food

Valproate

Valproate (as either sodium valproate or valproic acid) is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised epilepsy, generalised absences and myoclonic seizures, and can be tried in atypical absence, atonic, and tonic seizures. Valproate should generally be avoided in children under 2 years especially if they are on other antiepileptics, but may be required in infants with continuing epileptic tendency. Sodium valproate has widespread metabolic effects, and may have dose-related side-effects.

Valproic acid (as semisodium valproate) (section 4.2.3) is licensed for acute mania associated with bipolar disorder.

SODIUM VALPROATE

Cautions see notes above; monitor liver function before therapy and during first 6 months espe-

cially in children most at risk (see also below); measure full blood count and ensure no undue

◊ SODIUM VALPROATE (continued)

potential for bleeding before starting and before surgery; systemic lupus erythematosus; false-positive urine tests for ketones; avoid sudden withdrawal; **interactions:** see p. 264 and Appendix 1 (valproate)

Hepatic impairment avoid if possible; see also Contra-indications and Liver Toxicity below

Renal impairment reduce dose; adjust dosage according to free serum valproic acid concentration

Pregnancy see Pregnancy and Breast-feeding, p. 266; neonatal bleeding (related to hypofibrinemia) and neonatal hepatotoxicity also reported

Breast-feeding amount too small to be harmful
Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but children should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities)

Blood or hepatic disorders Children and their carers should be told how to recognise signs of blood or liver disorders and advised to seek immediate medical attention if symptoms develop

Pancreatitis Children and their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea and vomiting develop; discontinue if pancreatitis is diagnosed

Contra-indications active liver disease, family history of severe hepatic dysfunction; acute porphyria (section 9.8.2)

Side-effects nausea, gastric irritation, diarrhoea; weight gain; hyperammonaemia, thrombocytopenia; transient hair loss (regrowth may be curly); *less frequently* increased alertness, aggression, hyperactivity, behavioural disturbances, ataxia, tremor, and vasculitis; *rarely* hepatic dysfunction (see under Cautions; withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control), lethargy, drowsiness, confusion, stupor, hallucinations, menstrual disturbances, anaemia, leucopenia, pancytopenia, hearing loss, and rash; *very rarely* pancreatitis (see under Cautions), peripheral oedema, increase in bleeding time, extrapyramidal symptoms, encephalopathy, coma, gynaecomastia, Fanconi's syndrome, hirsutism, enuresis, hyponatraemia, acne, toxic epidermal necrolysis, and Stevens-Johnson syndrome; suicidal ideation

Indication and dose

All forms of epilepsy

- By mouth or by rectum

Neonate initially 20 mg/kg once daily; usual maintenance dose 10 mg/kg twice daily

Child 1 month–12 years initially 5–7.5 mg/kg twice daily; usual maintenance dose 12.5–15 mg/kg twice daily (up to 30 mg/kg twice daily in infantile spasms; monitor clinical

chemistry and haematological parameters if dose exceeds 20 mg/kg twice daily)

Child 12–18 years initially 300 mg twice daily increased in steps of 200 mg daily at 3-day intervals; usual maintenance dose 0.5–1 g twice daily; max. 1.25 g twice daily

Note If switching from oral therapy to intravenous therapy, the intravenous dose should be the same as the established oral dose

- By intravenous injection over 3–5 minutes

Neonate 10 mg/kg twice daily

Child 1 month–18 years 10 mg/kg twice daily

- By continuous intravenous infusion

Child 1 month–12 years initially 10 mg/kg by intravenous injection then by continuous intravenous infusion 20–40 mg/kg daily

Child 12–18 years initially 10 mg/kg by intravenous injection then up to max. 2.5 g daily by continuous intravenous infusion

Administration for rectal administration, sodium valproate oral solution may be given rectally and retained for 15 minutes (may require dilution with water to prevent rapid expulsion).

For intravenous injection, may be diluted in Glucose 5% or Sodium Chloride 0.9%.

For continuous intravenous infusion, dilute injection solution with Glucose 5% or Sodium Chloride 0.9%

◊ Oral

Sodium Valproate (Non-proprietary) (P_M)

Tablets (crushable), scored, sodium valproate 100 mg, net price 100 = £4.67. Label: 8, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Tablets, e/c, sodium valproate 200 mg, net price 100-tab pack = £5.71; 500 mg, 100-tab pack = £12.15. Label: 5, 8, 25, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Brands include *Orlept*[®]

Oral solution, sodium valproate 200 mg/5 mL, net price 300 mL = £6.20. Label: 8, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Brands include *Orlept*[®] sugar-free

Epilem[®] (Sanofi-Synthelabo) (P_M)

Tablets (crushable), scored, sodium valproate 100 mg, net price 100 = £4.67. Label: 8, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Tablets, both e/c, lilac, sodium valproate 200 mg, net price 100 = £7.70; 500 mg, 100 = £19.25. Label: 5, 8, 25, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Liquid, red, sugar-free, sodium valproate 200 mg/5 mL, net price 300-mL pack = £7.78. Label: 8, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

▮ SODIUM VALPROATE (continued)

Syrup, red, sodium valproate 200 mg/5 mL, net price 300-mL pack = £7.78. Label: 8, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

▮ Modified release

Epilim Chrono® (Sanofi-Synthelabo) (POM)

Tablets, m/r, lilac, sodium valproate 200 mg (as sodium valproate and valproic acid), net price 100-tab pack = £9.71; 300 mg, 100-tab pack = £14.56; 500 mg, 100-tab pack = £24.25. Label: 8, 25, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Dose

Child body-weight over 20 kg as above, total daily dose given in 1–2 divided doses

Epilim Chronosphere® (Sanofi-Aventis) (POM)

Granules, m/r, sodium valproate 50 mg (as sodium valproate and valproic acid), net price 30-sachet pack = £30.00; 100 mg, 30-sachet pack = £30.00; 250 mg, 30-sachet pack = £30.00; 500 mg, 30-sachet pack = £30.00; 750 mg, 30-sachet pack = £30.00. Label: 8, 25, counselling, administration, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Dose

Child as above, total daily dose given in 1–2 divided doses

Counselling Granules may be mixed with cold food or drink and swallowed immediately without chewing

Episenta® (Beacon) (POM)

Capsules, m/r, sodium valproate 150 mg, net price 100-cap pack = £5.70; 300 mg, 100-cap pack = £10.90. Label: 8, 25, counselling, administration, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Dose

Child as above, total daily dose given in 1–2 divided doses

Counselling Contents of capsule may be mixed with cold food or drink and swallowed immediately without chewing

Granules, m/r, sodium valproate 500 mg, net price 100-sachet pack = £18.00; 1 g, 100-sachet pack = £35.50. Label: 8, 25, counselling, administration, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Dose

Child as above, total daily dose given in 1–2 divided doses

Counselling Granules may be mixed with cold food or drink and swallowed immediately without chewing

▮ Parenteral

Epilim® Intravenous (Sanofi-Synthelabo) (POM)

Injection, powder for reconstitution, sodium valproate, net price 400-mg vial (with 4-mL amp water for injections) = £11.58

Episenta® (Beacon) (POM)

Injection, sodium valproate 100 mg/mL, net price 3-mL amp = £7.00, 10-mL amp = £23.33

▮ Valproic acid

Convulex® (Pharmacia) (POM)

Capsules, e/c, valproic acid 150 mg, net price 100-cap pack = £3.68; 300 mg, 100-cap pack = £7.35; 500 mg, 100-cap pack = £12.25. Label: 8, 25, counselling, pancreatitis, blood or hepatic disorder symptoms (see above), driving (see notes above)

Dose

Child as for sodium valproate, total daily dose given in 2–4 divided doses

Equivalence to sodium valproate Manufacturer advises that *Convulex*® has a 1:1 dose relationship with products containing sodium valproate, but nevertheless care is needed in making changes

Vigabatrin

For partial epilepsy with or without secondary generalisation, **vigabatrin** is given in combination with other antiepileptic treatment; its use is restricted to children in whom all other combinations are inadequate or are not tolerated. It can be used as sole therapy in the management of infantile spasms.

About one-third of those treated with vigabatrin have suffered visual field defects; counselling and **careful monitoring** for this side-effect are required (see also Visual Field Defects under Cautions below). Vigabatrin has prominent behavioural side-effects in some children.

VIGABATRIN

Cautions closely monitor neurological function; avoid sudden withdrawal (taper off over 2–4 weeks); history of psychosis, depression or behavioural problems; absence seizures (may be exacerbated); **interactions**: see p. 264 and Appendix 1 (vigabatrin)

Renal impairment consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 mL/minute/1.73 m²

Pregnancy see Pregnancy and Breast-feeding, p. 266

Breast-feeding see notes above; present in milk—manufacturer advises avoid

Visual field defects Vigabatrin is associated with visual field defects. The CSM has advised that onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation. Product literature advises visual field testing before treatment and at 6-month intervals; a pro-

▮ VIGABATRIN (continued)

cedure for testing visual fields in those with a developmental age of less than 9 years is available from the manufacturers. Children and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.

Contra-indications visual field defects

Side-effects drowsiness (rarely encephalopathic symptoms consisting of marked sedation, stupor, and confusion with non-specific slow wave EEG—reduce dose or withdraw), fatigue, visual field defects (see also under Cautions), dizziness, nervousness, irritability, behavioural effects such as excitation and agitation; depression, abnormal thinking, headache, nystagmus, ataxia, tremor, paraesthesia, impaired concentration; *less commonly* confusion, aggression, psychosis, mania, memory disturbance, visual disturbance (e.g. diplopia); also weight gain, oedema, gastrointestinal disturbances, alopecia, rash; *less commonly*, urticaria, occasional increase in seizure frequency (especially if myoclonic), decrease in liver enzymes, slight decrease in haemoglobin; photophobia and retinal disorders (e.g. peripheral retinal atrophy); optic neuritis, optic atrophy, hallucinations also reported

Indication and dose

Adjunctive treatment of partial seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics

• By mouth

Neonate initially 15–20 mg/kg twice daily increased over 2–3 weeks to usual maintenance dose 30–40 mg/kg twice daily; max. 75 mg/kg twice daily

Child 1 month–2 years initially 15–20 mg/kg twice daily increased over 2–3 weeks to usual maintenance dose 30–40 mg/kg twice daily; max. 75 mg/kg twice daily

Child 2–12 years initially 15–20 mg/kg (max. 250 mg) twice daily increased over 2–3 weeks to usual maintenance dose 30–40 mg/kg (max. 1.5 g) twice daily

Child 12–18 years initially 250 mg twice daily increased over 2–3 weeks to usual maintenance dose 1–1.5 g twice daily

Administration Tablets may be crushed and dispersed in liquid

• By rectum

Child 1 month–18 years dose as for oral therapy, see above

Administration dissolve contents of sachet in small amount of water and administer rectally

Infantile spasms as monotherapy

• By mouth

Neonate initially 15–25 mg/kg twice daily adjusted according to response over 7 days to usual maintenance dose 40–50 mg/kg twice daily; max. 75 mg/kg twice daily

Child 1 month–2 years initially 15–25 mg/kg twice daily adjusted according to response over 7 days to usual maintenance dose 40–50 mg/kg twice daily; max. 75 mg/kg twice daily

Sabril® (Aventis Pharma) (POM)

Tablets, f/c, scored, vigabatrin 500 mg, net price 100-tab pack = £30.84. Label: 3, 8, counselling, driving (see notes above)

Powder, sugar-free, vigabatrin 500 mg/sachet. Net price 50-sachet pack = £17.08. Label: 3, 8, 13, counselling, driving (see notes above)

Note The contents of a sachet should be dissolved in water or a soft drink immediately before taking

Benzodiazepines

Clonazepam is occasionally used in tonic-clonic or partial seizures, but its sedative side-effects may be prominent. **Clobazam** may be used as adjunctive therapy in the treatment of epilepsy, but the effectiveness of these and other benzodiazepines may wane considerably after weeks or months of continuous therapy.

CLOBAZAM

Cautions see under Diazepam (section 4.8.2)

Hepatic impairment may precipitate coma

Renal impairment start with small doses in severe impairment; increased cerebral sensitivity

Pregnancy avoid regular use (risk of neonatal withdrawal symptoms); use only if clear indication such as seizure control (high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia and respiratory depression)

Breast-feeding present in milk—avoid if possible

Contra-indications see under Diazepam (section 4.8.2)

Side-effects see under Diazepam (section 4.8.2)

Licensed use not licensed for use in children under 3 years

Indication and dose

Adjunctive therapy for epilepsy, monotherapy under specialist supervision for catamenial (menstruation) seizures (usually for 7–10 days each month, just before and during menstruation), cluster seizures

• By mouth

Child 1 month–12 years initially 125 micrograms/kg twice daily increased every 5 days to usual maintenance dose of 250 micrograms/kg twice daily; max. 500 micrograms/kg twice daily, not exceeding 15 mg twice daily

▮ **CLOBAZAM** (continued)

Child 12–18 years initially 10 mg twice daily increased every 5 days to usual maintenance dose of 10–15 mg twice daily; max. 30 mg twice daily

1 Clobazam (Non-proprietary) (POM) 

Tablets, clobazam 10 mg. Net price 30-tab pack = £9.74. Label: 2 or 19, 8, counselling, driving (see notes above)

Brands include *Frisium*® 

Tablets, clobazam 5 mg available on a named patient basis

1.  except for epilepsy and endorsed 'SL'S'

▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

CLONAZEPAM

Cautions see notes above; respiratory disease; spinal or cerebellar ataxia; myasthenia gravis (avoid if unstable); history of alcohol or drug abuse, depression or suicidal ideation; debilitated; avoid sudden withdrawal; acute porphyria (section 9.8.2); **interactions**: see p. 264 and Appendix 1 (anxiolytics and hypnotics)

Hepatic impairment can precipitate coma; reduce dose in mild to moderate impairment; avoid in severe impairment

Renal impairment start with small doses; increased cerebral sensitivity

Pregnancy avoid regular use (risk of neonatal withdrawal symptoms); use only if clear indication such as seizure control (high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia and respiratory depression)

Breast-feeding present in milk—avoid if possible
Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications respiratory depression; acute pulmonary insufficiency; sleep apnoea syndrome

Side-effects drowsiness, fatigue, dizziness, muscle hypotonia, coordination disturbances; also poor concentration, restlessness, confusion, amnesia, dependence, and withdrawal; salivary or bronchial hypersecretion in infants and small children; *rarely* gastro-intestinal symptoms, respiratory depression, headache, paradoxical effects including aggression and anxiety, sexual dysfunction, urinary incontinence, urticaria, pruritus, reversible hair loss, skin pigmentation changes; dysarthria, and visual disturbances on long-term treatment; blood disorders reported; **overdose**: see Emergency Treatment of Poisoning, p. 41

NITRAZEPAM

Cautions avoid abrupt withdrawal; respiratory disease; acute porphyria (section 9.8.2); muscle weakness and myasthenia gravis; **interactions**: Appendix 1 (anxiolytics and hypnotics)

Hepatic impairment can precipitate coma; avoid in severe hepatic impairment

Renal impairment start with small doses; increased cerebral sensitivity

Contra-indications respiratory depression, acute pulmonary insufficiency, sleep apnoea syndrome; marked neuromuscular respiratory weakness including myasthenia gravis

Side-effects drowsiness, confusion, ataxia; see also under Diazepam (section 4.8.2); **overdo-**

Indication and dose

All forms of epilepsy

• **By mouth**

Child 1 month–1 year initially 250 micrograms at night for 4 nights, increased over 2–4 weeks to usual maintenance dose of 0.5–1 mg at night (may be given in 3 divided doses if necessary)

Child 1–5 years initially 250 micrograms at night for 4 nights, increased over 2–4 weeks to usual maintenance dose of 1–3 mg at night (may be given in 3 divided doses if necessary)

Child 5–12 years initially 500 micrograms at night for 4 nights, increased over 2–4 weeks to usual maintenance dose of 3–6 mg at night (may be given in 3 divided doses if necessary)

Child 12–18 years initially 1 mg at night for 4 nights, increased over 2–4 weeks to usual maintenance dose of 4–8 mg at night (may be given in 3–4 divided doses if necessary)

Note Clonazepam doses in BNFC may differ from those in product literature

Administration for administration *by mouth*, injection solution may be given orally

Rivotril® (Roche) (POM) 

Tablets, both scored, clonazepam 500 micrograms (beige), net price 100 = £3.92; 2 mg (white), 100 = £5.23. Label: 2, 8, counselling, driving (see notes above)

Injection, section 4.8.2

Liquid, clonazepam 2.5 mg/mL

Available from 'special-order' manufacturers or specialist importing companies, see p. 943

▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

sage: see Emergency Treatment of Poisoning p. 41

Licensed use not licensed for use in children

Indication and dose

Infantile spasms

• **By mouth**

Child 1 month–2 years initially 125 micrograms/kg twice daily, adjusted according to response over 2–3 weeks to 250 micrograms/kg twice daily; max. 500 micrograms/kg (not exceeding 5 mg) twice daily; total daily dose may alternatively be given in 3 divided doses

□ NITRAZEPAM (continued)

Nitrazepam (Non-proprietary) (POM)

Oral suspension, nitrazepam 2.5 mg/5 mL, net

price 150 mL = £5.30. Label: 1, 8

Brands include Somnite® 

Other drugs

Acetazolamide (section 11.6), a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. It can also be used in conjunction with other antiepileptics for tonic-clonic or partial seizures.

Piracetam is used as adjunctive treatment for cortical myoclonus.

4.8.2 Drugs used in status epilepticus

Immediate measures to manage status epilepticus include positioning the child to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. **Pyridoxine** (section 9.6.2) should be administered if the status epilepticus is caused by pyridoxine deficiency.

Convulsive status epilepticus should be treated urgently with intravenous **lorazepam**. Intravenous **diazepam** is effective but it is associated with a high risk of venous thrombophlebitis (reduced by using an emulsion formulation of diazepam injection). **Clonazepam** can also be used as an alternative.

Where facilities for resuscitation are not immediately available, **midazolam** can be given into the buccal cavity, or **diazepam** can be administered as a rectal solution; the buccal route may be more acceptable in children.

Important

If seizures recur or fail to respond within 30 minutes, phenytoin sodium, fosphenytoin, or phenobarbital sodium should be used.

If these measures fail to control seizures within 60 minutes, anaesthesia with thiopental (section 15.1.1) or midazolam (section 15.1.4) should be instituted with full intensive care support. Lidocaine infusion has also been used but requires specialist management.

Phenytoin sodium may be given by slow intravenous injection, with ECG monitoring, followed by the maintenance dosage if appropriate. Intramuscular use of phenytoin is not recommended (absorption is slow and erratic).

Alternatively, **fosphenytoin**, a pro-drug of phenytoin, can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin. Intravenous administration requires ECG monitoring. Although it can also be given intramuscularly, absorption is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin should be expressed in terms of phenytoin sodium.

Paraldehyde given rectally causes little respiratory depression and is therefore useful where facilities for resuscitation are poor.

For **neonatal seizures**, see p. 267.

Non-convulsive status epilepticus The urgency to treat non-convulsive status epilepticus depends upon the severity of the child's condition. If there is incomplete loss of awareness, oral antiepileptic therapy should be restarted or continued. Children who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as convulsive status epilepticus although anaesthesia is rarely needed.

CLONAZEPAM

Cautions see section 4.8.1; facilities for reversing respiratory depression with mechanical ventilation must be at hand (but see also notes above)

Intravenous infusion Intravenous infusion of clonazepam is potentially hazardous (especially if prolonged), calling for close and constant observation and best carried out in

specialist centres with intensive care facilities. Prolonged infusion may lead to accumulation and delay recovery

Contra-indications see section 4.8.1; avoid injections containing benzyl alcohol in neonates (see under preparations below)

▮ CLONAZEPAM (continued)

Side-effects see section 4.8.1; hypotension and apnoea

Indication and dose

Status epilepticus

- By intravenous injection over at least 2 minutes

Neonate 100 micrograms/kg repeated after 24 hours if necessary (avoid unless there is no safer alternative)

Child 1 month–12 years 50 micrograms/kg (max. 1 mg) repeated if necessary

Child 12–18 years 1 mg repeated if necessary

- By intravenous infusion

Child 1 month–12 years initially 50 micrograms/kg (max. 1 mg) by intravenous injection then by intravenous infusion 10 micrograms/kg/hour adjusted according to response; max. 60 micrograms/kg/hour

Child 12–18 years initially 1 mg by intravenous injection then by intravenous infusion 10 micrograms/kg/hour adjusted according to response; max. 60 micrograms/kg/hour

Other forms of epilepsy section 4.8.1

Administration for intravenous injection, dilute to a concentration of 500 micrograms/mL with Water for Injections

For intravenous infusion, dilute to a concentration of 12 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; incompatible with bicarbonate; adsorbed on PVC—glass infusion apparatus preferred (if PVC apparatus used, complete infusion within 2 hours)

Rivotril® (Roche) (POM)

Injection, clonazepam 1 mg/mL in solvent, net price 1-mL amp (with 1 mL water for injections) = 63p

Excipients include benzyl alcohol (avoid in neonates unless there is no safer alternative available, see Excipients, p. 3), ethanol, propylene glycol

▮ Oral preparations

Section 4.8.1

DIAZEPAM

Cautions respiratory disease, muscle weakness and myasthenia gravis, history of drug or alcohol abuse, marked personality disorder; avoid prolonged use (and abrupt withdrawal thereafter); when given parenterally, close observation required until full recovery from sedation; when given intravenously, facilities for reversing respiratory depression with mechanical ventilation must be at hand (but see also notes above); porphyria (section 9.8.2); **interactions:** Appendix 1 (anxiolytics and hypnotics)

Hepatic impairment reduce dose as may precipitate coma; avoid in severe impairment

Renal impairment start with small doses; increased cerebral sensitivity

Pregnancy avoid regular use (risk of neonatal withdrawal symptoms); use only if clear indication such as seizure control (high doses during late pregnancy or labour may cause neonatal hyperthermia, hypotonia, and respiratory depression)

Breast-feeding avoid if possible—present in milk
Skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications respiratory depression; marked neuromuscular respiratory weakness including unstable myasthenia gravis; acute pulmonary insufficiency; sleep apnoea syndrome; not for chronic psychosis; should not be used alone in depression or in anxiety with depression; avoid injections containing benzyl alcohol in neonates (see under preparations below)

Side-effects drowsiness and lightheadedness the next day; confusion and ataxia; amnesia; dependence; paradoxical increase in aggression (see also section 4.1); muscle weakness; occasionally: headache, vertigo, hypotension, salivation changes, gastro-intestinal disturbances, visual

disturbances, dysarthria, tremor, changes in libido, incontinence, urinary retention; blood disorders and jaundice reported; skin reactions; on intravenous injection, pain, thrombophlebitis, and rarely apnoea; **overdose:** see Emergency Treatment of Poisoning, p. 41

Licensed use *Diazepam Rectubes*® and *Stesolid Rectal Tubes*® not licensed for use in children under 1 year

Indication and dose

Status epilepticus, febrile convulsions (section 4.8.3), convulsions caused by poisoning

- By intravenous injection over 3–5 minutes

Neonate 300–400 micrograms/kg repeated once after 10 minutes if necessary

Child 1 month–12 years 300–400 micrograms/kg repeated once after 10 minutes if necessary

Child 12–18 years 10–20 mg repeated once after 10 minutes if necessary

- By rectum (as rectal solution)

Neonate 1.25–2.5 mg repeated once after 10 minutes if necessary

Child 1 month–2 years 5 mg repeated once after 10 minutes if necessary

Child 2–12 years 5–10 mg repeated once after 10 minutes if necessary

Child 12–18 years 10 mg repeated once after 10 minutes if necessary

Muscle spasm section 10.2.2

Peri-operative use section 15.1.4.1

□ DIAZEPAM (continued)

Diazepam (Non-proprietary) (POM)

Injection (solution), diazepam 5 mg/mL. Net price 2-mL amp = 45p

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 3), ethanol, propylene glycol

Injection (emulsion), diazepam 5 mg/mL (0.5%).

Net price 2-mL amp = 84p

Brands include *Diazemuls*[®]

Rectal tubes (= rectal solution), diazepam 2 mg/mL, net price 1.25-mL (2.5-mg) tube = 90p, 2.5-mL (5-mg) tube = £1.27; 4 mg/mL, 2.5-mL (10-mg) tube = £1.65

Brands include *Diazepam Rectubes*[®], *Stesolid*[®]

■ Oral preparations

Section 15.1.4.1

FOSPHENYTOIN SODIUM

Note Fosphenytoin is a pro-drug of phenytoin

Cautions see Phenytoin Sodium; resuscitation facilities must be available; **interactions**: see p. 264 and Appendix 1 (phenytoin)

Hepatic impairment consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus)

Renal impairment consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus)

Pregnancy see Phenytoin (section 4.8.1)

Breast-feeding see Phenytoin (section 4.8.1)

Contra-indications see Phenytoin Sodium

Side-effects see Phenytoin Sodium

CSM advice Intravenous infusion of fosphenytoin has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The CSM advises:

- monitor heart rate, blood pressure, and respiratory function for duration of infusion
- observe patient for at least 30 minutes after infusion
- if hypotension occurs, reduce infusion rate or discontinue
- reduce dose or infusion rate in renal or hepatic impairment

Indication and dose

Expressed as **phenytoin sodium equivalent (PE)**; fosphenytoin sodium 1.5 mg \equiv phenytoin sodium 1 mg

Status epilepticus

- **By intravenous infusion** (at a rate of 2–3 mg(PE)/kg/minute)

Child 5–18 years initially 20 mg(PE)/kg, then

(at a rate of 1–2 mg(PE)/kg/minute) 4–5 mg(PE)/kg; total daily dose may be given in 1–4 divided doses; adjusted according to response and trough plasma-phenytoin concentration

Prophylaxis or treatment of seizures associated with neurosurgery or head injury

- **By intravenous infusion** (at a rate of 1–2 mg(PE)/kg/minute)

Child 5–18 years initially 10–15 mg(PE)/kg then 4–5 mg(PE)/kg daily; total daily dose may be given in 1–4 divided doses; adjusted according to response and trough plasma-phenytoin concentration

Temporary substitution for oral phenytoin

- **By intravenous infusion** (at a rate of 1–2 mg(PE)/kg/minute)

Child 5–18 years same dose and dosing frequency as oral phenytoin therapy

Note Fosphenytoin sodium doses in BNFC may differ from those in product literature

Note Prescriptions for fosphenytoin sodium should state the dose in terms of phenytoin sodium equivalent (PE)

Administration for *intermittent intravenous infusion*, dilute to a concentration of 1.5–25 mg (PE)/mL with Glucose 5% or Sodium Chloride 0.9%

Pro-Epanutin[®] (Pfizer) (POM)

Injection, fosphenytoin sodium 75 mg/mL (equivalent to phenytoin sodium 50 mg/mL), net price 10-mL vial = £40.00

Electrolytes phosphate 3.7 micromol/mg fosphenytoin sodium (phosphate 5.6 micromol/mg phenytoin sodium)

LORAZEPAM

Cautions see under Diazepam; facilities for reversing respiratory depression with mechanical ventilation must be at hand

Contra-indications see under Diazepam

Side-effects see under Diazepam; hypotension and apnoea

Indication and dose

Status epilepticus

- **By slow intravenous injection**

Neonate 100 micrograms/kg as a single dose, repeated once after 10 minutes if necessary

Child 1 month–12 years 100 micrograms/kg (max. 4 mg) as a single dose, repeated once after 10 minutes if necessary

Child 12–18 years 4 mg as a single dose, repeated once after 10 minutes if necessary

Administration for *intravenous injection*, dilute with an equal volume of Sodium Chloride 0.9% or Water for Injections (for neonates, dilute injection solution to a concentration of 100 micrograms/mL); give slowly into a large vein at a rate not exceeding 50 micrograms/kg over 3–5 minutes.

■ Preparations

Section 15.1.4.1

MIDAZOLAM

Cautions section 15.1.4**Contra-indications** section 15.1.4**Side-effects** section 15.1.4**Licensed use** buccal liquid and injection not licensed for use in status epilepticus**Indication and dose****Status epilepticus**

- By buccal administration

Neonate 300 micrograms/kg repeated once after 10 minutes if necessary

Child 1–6 months 300 micrograms/kg (max. 2.5 mg), repeated once after 10 minutes if necessary

Child 6 months–1 year 2.5 mg, repeated once after 10 minutes if necessary

Child 1–5 years 5 mg, repeated once after 10 minutes if necessary

Child 5–10 years 7.5 mg, repeated once after 10 minutes if necessary

Child 10–18 years 10 mg, repeated once after 10 minutes if necessary

- By intravenous administration

Neonate initially by intravenous injection 150–200 micrograms/kg followed by continuous infusion of 1 microgram/kg/minute (increased by 1 microgram/kg/minute every 15 minutes until seizure controlled; max. 5 micrograms/kg/minute)

Child 1 month–18 years initially by intravenous injection 150–200 micrograms/kg followed by continuous intravenous infusion of 1 microgram/kg/minute (increased by 1 microgram/kg/minute every 15 minutes) until seizure controlled; max. 5 micrograms/kg/minute

Administration for intravenous injection, dilute with Glucose 5% or Sodium Chloride 0.9%; rapid intravenous injection (less than 2 minutes) may cause seizure-like myoclonus in preterm neonate. For buccal administration, injection solution may be given buccally or by mouth

Preparations

Section 15.1.4

PARALDEHYDE

Cautions bronchopulmonary disease, hepatic impairment; **interactions:** Appendix 1 (paraldehyde)**Pregnancy** manufacturer advises avoid—crosses placenta**Breast-feeding** present in milk—manufacturer advises avoid unless essential**Contra-indications** gastric disorders; rectal administration in colitis**Side-effects** rashes; rectal irritation after enema**Licensed use** not licensed for use in children as an enema**Indication and dose****Status epilepticus**

- By rectum (doses expressed as undiluted paraldehyde)

Neonate 0.4 mL/kg (max. 0.5 mL) as a single dose

Child 1–3 months 0.5 mL as a single dose

Child 3–6 months 1 mL as a single dose

Child 6 months–1 year 1.5 mL as a single dose

Child 1–2 years 2 mL as a single dose

Child 2–5 years 3–4 mL as a single dose

Child 5–18 years 5–10 mL as a single dose

Administration for rectal administration, do not administer paraldehyde undiluted

Paraldehyde (Non-proprietary) (POM)

Enema, 8–50%, available from 'special-order' manufacturers or specialist importing companies, see p. 943

PHENOBARBITAL SODIUM

Phenobarbitone sodium

Cautions see under Phenobarbital (section 4.8.1)**Side-effects** see under Phenobarbital (section 4.8.1)**Indication and dose****Status epilepticus**

- By slow intravenous injection

Neonate initially 20 mg/kg then 2.5–5 mg/kg once or twice daily

Child 1 month–12 years initially 20 mg/kg then 2.5–5 mg/kg once or twice daily

Child 12–18 years initially 20 mg/kg (max. 1 g) then 300 mg twice daily

Other forms of epilepsy

Note For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect

Administration for intravenous injection, dilute to a concentration of 20 mg/mL with Water for Injections; give over 20 minutes (no faster than 1 mg/kg/minute)

▢ PHENOBARBITAL SODIUM (continued)

Phenobarbital (Non-proprietary) (CD)

Injection, phenobarbital sodium 200 mg/mL, net price 1-mL amp = £2.00

Excipients include propylene glycol 90% (see Excipients, p. 3)

Note Must be diluted before intravenous administration (see Administration)

▀ Oral preparations

Section 4.8.1

PHENYTOIN SODIUM

Cautions hypotension and heart failure; resuscitation facilities must be available; injection solutions alkaline (irritant to tissues); see also p. 274; **interactions**: see p. 264 and Appendix 1 (phenytoin)

Contra-indications sinus bradycardia, sino-atrial block, and second- and third-degree heart block; Stokes-Adams syndrome; acute porphyria (section 9.8.2)

Side-effects intravenous injection may cause cardiovascular and CNS depression (particularly if injection too rapid) with arrhythmias, hypotension, and cardiovascular collapse; alterations in respiratory function (including respiratory arrest); injection-site reactions, see also p. 274

Indication and dose

Status epilepticus, acute symptomatic seizures associated with trauma or neurosurgery

- By slow intravenous injection or infusion (with blood-pressure and ECG monitoring)

Neonate initially 18 mg/kg as a loading dose then 2.5–5 mg/kg twice daily

Child 1 month–12 years initially 18 mg/kg as a loading dose then 2.5–5 mg/kg twice daily

Child 12–18 years initially 18 mg/kg as a loading dose then up to 100 mg 3–4 times daily

- By intramuscular injection
Not recommended (see notes above)

Other forms of epilepsy section 4.8.1

Note Phenytoin sodium doses in BNFC may differ from those in product literature

Administration before and after administration flush intravenous line with Sodium Chloride 0.9%.

For *intravenous injection*, give at rate not exceeding 1 mg/kg/minute (max. 50 mg/minute).

For *intravenous infusion*, dilute to a concentration not exceeding 10 mg/mL with Sodium Chloride 0.9% and give through an in-line filter (0.22–0.50 micron) at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute); complete administration within 1 hour of preparation

Phenytoin (Non-proprietary) (POM)

Injection, phenytoin sodium 50 mg/mL with propylene glycol 40% and alcohol 10% in water for injections, net price 5-mL amp = £3.40

Epanutin® Ready-Mixed Parenteral (Pfizer) (POM)

Injection, phenytoin sodium 50 mg/mL with propylene glycol 40% and alcohol 10% in water for injections. Net price 5-mL amp = £4.88

▀ Oral preparations

Section 4.8.1

4.8.3 Febrile convulsions

Brief febrile convulsions need no specific treatment; antipyretic medication e.g. **paracetamol** (section 4.7.1) is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. *Prolonged febrile convulsions* (those lasting 15 minutes or longer), *recurrent convulsions*, or those occurring in a child at known risk must be treated more actively, as there is the possibility of resulting brain damage. **Diazepam** (section 4.8.2) is the drug of choice given either by slow intravenous injection or preferably rectally in solution, repeated if necessary. The rectal solution is generally preferred as satisfactory absorption is achieved within minutes and administration is much easier. Suppositories are not suitable because absorption is too slow.

Intermittent prophylaxis (i.e. the anticonvulsant administered at the onset of fever) is possible in only a small proportion of children; rectal administration of **diazepam** is the treatment of choice.

Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated. Anticonvulsant treatment needs to be considered only for children at risk from prolonged or complex febrile convulsions, including those whose first seizure occurred at under 14 months or who have neurological abnormalities or who have had previous prolonged or focal convulsions.

4.9 Drugs used in dystonias and related disorders

4.9.1 Dopaminergic drugs used in dystonias

4.9.2 Antimuscarinic drugs used in dystonias

4.9.3 Drugs used in essential tremor, chorea, tics, and related disorders

Dystonias may result from conditions such as cerebral palsy or may be related to a deficiency of the neurotransmitter dopamine as in Segawa syndrome.

4.9.1 Dopaminergic drugs used in dystonias

Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral **dopa-decarboxylase inhibitor** that reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting and cardiovascular effects; additionally, effective brain-dopamine concentrations can be achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitor most commonly used in children is carbidopa (in **co-careldopa**).

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual child.

In severe dystonias related to cerebral palsy, improvement can be expected within 2 weeks. Children with Segawa syndrome are particularly sensitive to levodopa; they may even become symptom free on small doses. Levodopa also has a role in treating metabolic disorders such as defects in tetrahydrobiopterin synthesis and dihydrobiopterin reductase deficiency. For the use of tetrahydrobiopterin in metabolic disorders see section 9.4.1.

Children may experience nausea within 2 hours of taking a dose; nausea and vomiting with co-careldopa is rarely dose-limiting but domperidone (section 4.6) may be useful in controlling these effects.

In dystonic cerebral palsy treatment with larger doses of levodopa is associated with the development of potentially troublesome motor complications including response fluctuations and dyskinesias. Response fluctuations are characterised by large variations in motor performance, with normal function during the 'on' period, and weakness and restricted mobility during the 'off' period.

Sudden onset of sleep

Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa.

Children starting treatment with these drugs, and their carers, should be warned of the possibility of these effects and of the need to exercise caution when performing skilled tasks e.g. driving or operating machinery.

Children who have suffered excessive sedation or sudden onset of sleep should refrain from performing skilled tasks until those effects have stopped recurring.

CO-CARELDOPA

A mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively

Cautions see also notes above; pulmonary disease, peptic ulceration, cardiovascular disease, diabetes mellitus, osteomalacia, open-angle glaucoma, history of skin melanoma (risk of activation), psychiatric illness (avoid if severe); warn children and carers about excessive drowsiness (see notes above); in prolonged therapy, psychiatric, hepatic, haematological, renal, and cardiovascular surveillance is advisable; warn patients to resume normal activities gradually; avoid abrupt withdrawal; **interactions:** Appendix 1 (levodopa)

Contra-indications closed-angle glaucoma

Pregnancy manufacturers advise toxicity in *animal* studies

Breast-feeding may suppress lactation; present in milk—manufacturers advise avoid

Side-effects see also notes above; anorexia, nausea and vomiting, insomnia, agitation, postural hypotension (rarely labile hypertension), dizziness, tachycardia, arrhythmias, reddish discoloration of urine and other body fluids, rarely hypersensitivity; abnormal involuntary movements and psychiatric symptoms which include hypomania and psychosis may be dose-limiting; depression, drowsiness, headache, flushing,

CO-CARELDOPA (continued)

sweating, gastro-intestinal bleeding, peripheral neuropathy, taste disturbance, pruritus, rash, and liver enzyme changes also reported; syndrome resembling neuroleptic malignant syndrome reported on withdrawal

Licensed use not licensed for use in children

Indication and dose

Dopamine-sensitive dystonias including Segawa syndrome and dystonias related to cerebral palsy

- By mouth, expressed as levodopa

Child 3 months–18 years initially 250 micrograms/kg 2–3 times daily of a preparation containing 1:4 carbidopa:levodopa, increased according to response every 2–3 days to max. 1 mg/kg three times daily

Treatment of defects in tetrahydrobiopterin synthesis and dihydrobiopterin reductase deficiency

- By mouth, expressed as levodopa

Neonate initially 250–500 micrograms/kg 4 times daily of a preparation containing 1:4 carbidopa:levodopa, increased according to response every 4–5 days to maintenance dose of 2.5–3 mg/kg 4 times daily; at higher doses consider preparation containing 1:10 carbidopa:levodopa; review regularly (every 3–6 months)

Child 1 month–18 years initially 250–500 micrograms/kg 4 times daily of a preparation containing 1:4 carbidopa:levodopa, increased according to response every 4–5 days to maintenance dose of 2.5–3 mg/kg 4 times daily; at higher doses consider preparation containing 1:10 carbidopa:levodopa; review regularly (every 3–6 months in early childhood)

Sinemet® (Bristol-Myers Squibb) (POM)

Sinemet-62.5® tablets, yellow, scored, co-careldopa 12.5/50 (carbidopa 12.5 mg (as monohydrate), levodopa 50 mg), net price 90-tab pack = £6.54. Label: 14, counselling, driving, see notes above

Note 2 tablets *Sinemet-62.5®* = 1 tablet *Sinemet Plus®*; *Sinemet-62.5®* previously known as *Sinemet LS®*

Sinemet-110® tablets, blue, scored, co-careldopa 10/100 (carbidopa 10 mg (as monohydrate), levodopa 100 mg), net price 90-tab pack = £6.84. Label: 14, counselling, driving, see notes above

Sinemet-Plus® tablets, yellow, scored, co-careldopa 25/100 (carbidopa 25 mg (as monohydrate), levodopa 100 mg), net price 90-tab pack = £10.05. Label: 14, counselling, driving, see notes above

Sinemet-275® tablets, blue, scored, co-careldopa 25/250 (carbidopa 25 mg (as monohydrate), levodopa 250 mg), net price 90-tab pack = £14.28. Label: 14, counselling, driving, see notes above

4.9.2 Antimuscarinic drugs used in dystonias

Antimuscarinic drugs help to control dystonias.

The antimuscarinic drugs **procyclidine** and **trihexyphenidyl** (benzhexol) reduce the symptoms of dystonias, including those induced by antipsychotic drugs; there is no justification for giving them routinely in the absence of dystonic symptoms. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

No important differences exist between the antimuscarinic drugs, but some children tolerate one better than another.

Cautions Antimuscarinics should be used with caution in cardiovascular disease, hypertension, psychotic disorders, pyrexia, and in those susceptible to angle-closure glaucoma. Antimuscarinics should not be withdrawn abruptly in children receiving long-term treatment. Antimuscarinics are liable to abuse. They should also be used with caution in hepatic impairment, renal impairment, pregnancy, and breast-feeding. **Interactions:** Appendix 1 (Antimuscarinics).

Driving May affect performance of skilled tasks (e.g. driving).

Contra-indications Antimuscarinics should be avoided in gastro-intestinal obstruction and myasthenia gravis.

Side-effects Side-effects of antimuscarinics include constipation, dry mouth, nausea, vomiting, tachycardia, dizziness, confusion, euphoria, hallucinations, impaired memory, anxiety, restlessness, urinary retention, blurred vision, and rash. Angle-closure glaucoma may occur very rarely.

PROCYCLIDINE HYDROCHLORIDE

Cautions see notes above

Pregnancy manufacturers advise use only if potential benefit outweighs risk

Breast-feeding no information available

Contra-indications see notes above

Side-effects see notes above

□ PROCYCLIDINE HYDROCHLORIDE (*continued*)

Licensed use not licensed for use in children

Indication and dose

Dystonias

- By mouth

Child 7–12 years 1.25 mg 3 times daily

Child 12–18 years 2.5 mg 3 times daily

Acute dystonia

- By intramuscular or intravenous injection

Child under 2 years 0.5–2 mg as a single dose

Child 2–10 years 2–5 mg as a single dose

Child 10–18 years 5–10 mg (occasionally more than 10 mg)

Note Usually effective in 5–10 minutes but may need 30 minutes for relief

Procyclidine (Non-proprietary) (POM)

Tablets, procyclidine hydrochloride 5 mg, net price 28-tab pack = £3.26. Counselling, driving

Arpicolin[®] (Rosemont) (POM)

Syrup, sugar-free, procyclidine hydrochloride 2.5 mg/5 mL, net price 150 mL = £4.22; 5 mg/5 mL, 150 mL pack = £7.54. Counselling, driving

Kemadrin[®] (GSK) (POM)

Tablets, scored, procyclidine hydrochloride 5 mg, net price 20 = 94p. Counselling, driving

Kemadrin[®] (Auden Mckenzie) (POM)

Injection, procyclidine hydrochloride 5 mg/mL, net price 2-mL amp = £1.49

TRIHEXYPHENIDYL HYDROCHLORIDE

(Benzhexol hydrochloride)

Cautions see notes above

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children

Indication and dose

Dystonia

- By mouth

Child 1 month–18 years 1–2 mg daily in 1–2 divided doses, adjusted according to response

Trihexyphenidyl (Non-proprietary) (POM)

Tablets, trihexyphenidyl hydrochloride 2 mg, net price 84-tab pack = £24.63; 5 mg, 100-tab pack = £14.63. Counselling, before or after food, driving

Broflex[®] (Alliance) (POM)

Syrup, pink, black currant, trihexyphenidyl hydrochloride 5 mg/5 mL, net price 200 mL = £6.20. Counselling, driving

4.9.3 Drugs used in essential tremor, chorea, tics, and related disorders

Haloperidol may be useful in improving motor tics and symptoms of Tourette syndrome and related choreas (see section 4.2.1). **Pimozide** (section 4.2.1) and **sulpiride** (section 4.2.1) are also used in Tourette syndrome.

Propranolol or another beta-adrenoceptor blocking drug (section 2.4) may be useful in treating essential tremor or tremor associated with anxiety or thyrotoxicosis.

BOTULINUM TOXIN TYPE A

Cautions neurological disorders; history of dysphagia or aspiration

Pregnancy manufacturers advise avoid unless essential—toxicity in *animal* studies

Breast-feeding manufacturers advise avoid (or avoid unless essential)—no information available

Contra-indications generalised disorders of muscle activity (e.g. myasthenia gravis)

Side-effects increased electrophysiologic jitter in some distant muscles; misplaced injections may paralyse nearby muscle groups and excessive doses may paralyse distant muscles; influenza-like symptoms, *rarely* arrhythmias, myocardial infarction, seizures, hypersensitivity reactions including rash, pruritus and anaphylaxis, antibody formation (substantial deterioration in

response), and injection-site reactions; *very rarely* exaggerated muscle weakness, dysphagia, and aspiration

Specific side-effects in paediatric cerebral palsy Drowsiness, paraesthesia, urinary incontinence, myalgia

Indication and dose

In children over 2 years for dynamic equinus foot deformity caused by spasticity in ambulant paediatric cerebral palsy for dose consult product literature (**important**: information specific to each **individual preparation and not interchangeable**)

□ BOTULINUM TOXIN TYPE A (continued)

Botox® (Allergan) (POM)

Injection, powder for reconstitution, botulinum A neurotoxin complex, net price 50-unit vial = £72.30; 100-unit vial = £128.93

Dysport® (Ipsen) (POM)

Injection, powder for reconstitution, botulinum A toxin-haemagglutinin complex, net price 500-unit vial = £164.50

4.10 Drugs used in substance dependence

This section includes drugs used in the treatment of neonatal abstinence syndrome and cigarette smoking.

Treatment of alcohol or opioid dependence in children requires specialist management. The health departments of the UK have produced a report, *Drug Misuse and Dependence* which contains guidelines on clinical management.

Drug Misuse and Dependence, London, The Stationery Office, 1999 can be obtained from:

The Publications Centre
PO Box 276
London, SW8 5DT.
Tel: (087) 0600 5522
Fax: (087) 0600 5533

or from The Stationery Office bookshops and through all good booksellers.

Neonatal abstinence syndrome Neonatal abstinence syndrome occurs at birth as a result of intra-uterine exposure to opioids or high-dose benzodiazepines.

Treatment is usually initiated if:

- feeding becomes a problem and tube feeding is required;
- there is profuse vomiting or watery diarrhoea;
- the baby remains very unsettled after two consecutive feeds despite gentle swaddling and the use of a pacifier.

Treatment involves weaning the baby from the drug on which it is dependent.

Morphine or **methadone** (section 4.7.2) can be used in babies of mothers who have been taking opioids. Morphine is widely used because the dose can be easily adjusted, but methadone may provide smoother control of symptoms. Weaning babies from opioids usually takes 7–10 days.

Weaning babies from benzodiazepines that have a long half-life is difficult to manage; **chlorpromazine** (section 4.2.1) may be used in these situations but excessive sedation may occur. For babies who are dependent on barbiturates, phenobarbital (section 4.8.1) may be tried, although it does not control gastrointestinal symptoms.

Cigarette smoking

Smoking cessation interventions are a cost-effective way of reducing ill health and prolonging life. Smokers should be advised to stop and offered help if interested in doing so, with follow-up where appropriate.

Where possible, smokers should have access to a smoking cessation clinic for behavioural support. **Nicotine replacement therapy** is an effective aid to smoking cessation for those smoking more than 10 cigarettes a day. It is regarded as the pharmacological treatment of choice in the management of smoking cessation.

Cigarette smoking should stop completely before starting a smoking cessation regimen including nicotine replacement therapy. If complete smoking cessation is not possible some nicotine preparations are licensed for use as part of a programme to reduce smoking before stopping completely; the smoking cessation regimen can be followed during a quit attempt.

NICE guidance

Nicotine replacement therapy for smoking cessation (March 2002)

Nicotine replacement therapy should be prescribed only for a smoker who commits to a target stop date. The smoker should be offered advice and encouragement to aid smoking cessation.

Therapy to aid smoking cessation is chosen according to the smoker's likely compliance, availability of counselling and support, previous experience of smoking-cessation aids, contra-indications and adverse effects of the products, and the smoker's preferences.

Initial supply of the prescribed smoking-cessation therapy should be sufficient to last only 2 weeks after the target stop date. A second prescription should be issued only if the smoker demonstrates a continuing attempt to stop smoking.

If an attempt to stop smoking is unsuccessful, the NHS should not normally fund a further attempt within 6 months.

NICOTINE

Cautions severe or unstable cardiovascular disease (including hospitalisation for severe arrhythmias, recent myocardial infarction, or recent cerebrovascular accident)—initiate under medical supervision; uncontrolled hyperthyroidism; diabetes mellitus (monitor blood-glucose concentration closely when initiating treatment); phaeochromocytoma; *oral preparations*, oesophagitis, gastritis, peptic ulcers; *patches*, exercise may increase absorption and side-effects, skin disorders (patches should not be placed on broken skin)

Hepatic impairment manufacturers advise caution in moderate to severe hepatic impairment

Renal impairment manufacturers advise caution in severe renal impairment

Pregnancy use only if smoking cessation without nicotine replacement therapy fails; intermittent therapy preferred but avoid liquorice-flavoured nicotine products

Breast-feeding present in milk; intermittent therapy preferred

Note Most warnings under Cautions also apply to continuation of cigarette smoking

Side-effects gastro-intestinal disturbances (including nausea, vomiting, dyspepsia); headache, dizziness; influenza-like symptoms; dry mouth; rash; *less frequently* palpitation; *rarely* atrial fibrillation; *with nasal spray*, sneezing, epistaxis, watering eyes, ear sensations; *with lozenges*, thirst, paraesthesia of mouth, taste disturbances; *with patches*, skin reactions (discontinue if severe)—vasculitis also reported, blood pressure changes; *with patches or lozenges*, sleep disturbances, nightmares, chest pain; *with gum or lozenges*, mouth ulceration, increased salivation; *with gum, lozenge, sublingual tablets, or inhalator*, hiccups, throat irritation

Indication and dose

See under preparations, below

Nicorette® (McNeil)

Nicorette Microtab (sublingual), nicotine (as a cyclodextrin complex) 2 mg, net price starter pack of 2 × 15-tablet discs with dispenser = £3.99; refill pack of 7 × 15-tablet discs = £11.12. Label: 26

Dose**Smoking cessation**• **By sublingual administration**

Child 12–18 years individuals smoking 20 cigarettes or less daily, 2 mg each hour; for patients who fail to stop smoking or have significant withdrawal symptoms, consider increasing to 4 mg each hour; individuals smoking more than 20 cigarettes daily, 4 mg each hour. Max. 80 mg daily; treatment continued for up to 8 weeks followed by gradual reduction over 4 weeks; review treatment if abstinence not achieved within 3 months

Nicorette chewing gum, sugar-free, nicotine (as resin) 2 mg, net price pack of 15 = £1.71, pack of 30 = £3.25, pack of 105 = £8.89; 4 mg, net price pack of 15 = £2.11, pack of 30 = £3.99, pack of 105 = £10.83

Note Also available in mint, freshfruit, freshmint, and icy white flavours

Dose**Smoking cessation**• **By mouth**

Child 12–18 years individuals smoking 20 cigarettes or less daily, initially chew one 2-mg piece slowly (chew gum until taste becomes strong, then rest gum between cheek and gum, when taste fades start chewing again) for approx. 30 minutes when urge to smoke occurs; individuals smoking more than 20 cigarettes daily or needing more than 15 pieces of 2-mg gum daily should use the 4-mg gum, max. 15 pieces of 4-mg gum daily; treatment continued for up to 8 weeks followed by gradual reduction over 4 weeks; review treatment if abstinence not achieved within 3 months

Smoking reduction• **By mouth**

Child 12–18 years chew one piece when urge to smoke occurs between smoking episodes (chew gum until taste becomes strong, then rest gum between cheek and gum, when taste fades start chewing again); reduce smoking within 6 weeks and attempt smoking cessation within 6 months; review treatment if abstinence not achieved within 9 months

Note Children under 18 years should consult a healthcare professional before starting smoking-reduction regimen

◊ NICOTINE (continued)

Nicorette patches, self-adhesive, all beige, nicotine, '5 mg' patch (releasing approx. 5 mg/16 hours), net price 7 = £9.07; '10 mg' patch (releasing approx. 10 mg/16 hours), 7 = £9.07; '15 mg' patch (releasing approx. 15 mg/16 hours), 2 = £2.85, 7 = £9.07

Dose

Smoking cessation

• By transdermal route

Child 12–18 years apply on waking to dry, non-hairy skin on hip, chest, or upper arm, removing after approx. 16 hours, usually when retiring to bed; site next patch on different area (avoid using same area on consecutive days); initially '15-mg' patch for 16 hours daily for 8 weeks then if abstinence achieved '10-mg' patch for 16 hours daily for 2 weeks then '5-mg' patch for 16 hours daily for 2 weeks; review treatment if abstinence not achieved within 3 months—further courses may be given if considered beneficial

Nicorette Invisi patches, self-adhesive, beige, nicotine, '10 mg' patch (releasing approx. 10 mg/16 hours), net price 7 = £14.83; '15 mg' patch (releasing approx. 15 mg/16 hours), 7 = £14.83; '25 mg' patch (releasing approx. 25 mg/16 hours), 7 = £14.83

Dose

Smoking cessation

• By transdermal route

Child 12–18 years apply on waking to dry, non-hairy skin on hip, chest, or upper arm, removing after approx. 16 hours, usually when retiring to bed; site next patch on different area (avoid using same area on consecutive days); individuals smoking 10 or more cigarettes daily, initially '25-mg' patch for 16 hours daily for 8 weeks then if abstinence achieved '15-mg' patch for 16 hours daily for 2 weeks then '10-mg' patch for 16 hours daily for 2 weeks; individuals smoking less than 10 cigarettes daily, initially '15-mg' patch for 16 hours daily for 8 weeks then '10-mg' patch for 16 hours daily for 4 weeks; review treatment if abstinence not achieved within 3 months—further courses may be given if considered beneficial

Note Patients using the '25-mg' patch who experience excessive side-effects that do not resolve within a few days should change to '15-mg' patch for the remainder of the initial 8-week course before switching to the '10-mg' patch for the final 4 weeks

Nicorette nasal spray, nicotine 500 micrograms/metered spray, net price 200-spray unit = £12.26

Dose

Smoking cessation

• Intranasally

Child 12–18 years apply 1 spray into each nostril as required to max. twice an hour for 16 hours daily (max. 64 sprays daily) for 8 weeks, then reduce gradually over next 4 weeks (reduce by half at end of first 2 weeks, stop altogether at end of next 2 weeks); review treatment if abstinence not achieved within 3 months

Nicorette inhalator (nicotine-impregnated plug for use in inhalator mouthpiece), nicotine 10 mg/cartridge, net price 6-cartridge (starter) pack = £3.99, 42-cartridge (refill) pack = £12.82

Dose

Smoking cessation

• By inhalation

Child 12–18 years inhale when urge to smoke occurs; initially use between 6 and 12 cartridges daily for up to 8 weeks, then reduce gradually over 4 weeks (reduce by half over first 2 weeks, stop altogether at end of next 2 weeks); review treatment if abstinence not achieved within 3 months

Smoking reduction

• By inhalation

Child 12–18 years inhale when urge to smoke occurs between smoking episodes; reduce smoking within 6 weeks and attempt smoking cessation within 6 months; review treatment if abstinence not achieved within 9 months

Note Children under 18 years should consult a healthcare professional before starting smoking-reduction regimen

Nicotinell® (Novartis Consumer Health)

Chewing gum, sugar-free, nicotine 2 mg, net price pack of 12 = £1.71, pack of 24 = £3.01, pack of 96 = £8.26; 4 mg, pack of 12 = £1.70, pack of 24 = £3.30, pack of 96 = £10.26

Note Also available in fruit, liquorice, and mint flavours

Dose

Smoking cessation

• By mouth

Child 12–18 years individuals smoking 20 cigarettes or less daily, initially chew one 2-mg piece slowly (chew gum until taste becomes strong, then rest gum between cheek and gum, when taste fades start chewing again) for approx. 30 minutes when urge to smoke occurs; individuals smoking more than 20 cigarettes daily should use the 4-mg strength; max. 60 mg daily; withdraw gradually; review treatment if abstinence not achieved within 3 months

Nicotinell mint lozenge, sugar-free, nicotine (as bitartrate) 1 mg, net price pack of 12 = £1.71, pack of 36 = £4.27, pack of 96 = £9.12; 2 mg, net price pack of 12 = £1.99, pack of 36 = £4.95, pack of 96 = £10.60. Label: 24

Excipients include aspartame (section 9.4.1)

Dose

Smoking cessation

• By mouth

Child 12–18 years individuals smoking 30 cigarettes or less daily, initially suck one 1-mg lozenge every 1–2 hours when urge to smoke occurs; individuals smoking more than 30 cigarettes daily should use 2-mg strength; max. 30 mg daily; withdraw gradually; review treatment if abstinence not achieved within 3 months

TTS Patches, self-adhesive, all yellowish-ochre, nicotine, '10' patch (releasing approx. 7 mg/24 hours), net price 7 = £9.12; '20' patch (releasing approx. 14 mg/24 hours), net price 2 = £2.57, 7 = £9.40; '30' patch (releasing approx. 21 mg/24 hours), net price 2 = £2.85, 7 = £9.97, 21 = £24.51

Dose

Smoking cessation

• By transdermal route

Child 12–18 years apply to dry, non-hairy skin on trunk or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same area for several days); individuals smoking less than 20 cigarettes daily, initially '20' patch daily; individuals smoking 20 or more cigarettes daily, initially '30' patch daily; withdraw gradually, reducing dose every 3–4 weeks; review treatment if abstinence not achieved within 3 months

▮ NICOTINE (continued)

NiQuitin® (GSK Consumer Healthcare)

Chewing gum, sugar-free, mint-flavour, nicotine 2 mg (white), net price pack of 12 = £1.71, pack of 24 = £2.85, pack of 96 = £8.55; 4 mg (yellow), pack of 12 = £1.71, pack of 24 = £2.85, pack of 96 = £8.55

Dose

Smoking cessation

• By mouth

Child 12–18 years initially chew 1 piece slowly (chew gum until taste becomes strong, then rest gum between cheek and gum, when taste fades start chewing again) for approx. 30 minutes, when urge to smoke occurs; max. 15 pieces daily; withdraw gradually; review treatment if abstinence not achieved within 3 months

Smoking reduction

• By mouth

Child 12–18 years chew 1 piece when urge to smoke occurs between smoking episodes (chew gum until taste becomes strong, then rest gum between cheek and gum, when taste fades start chewing again); reduce smoking within 6 weeks and attempt cessation within 6 months; review treatment if abstinence not achieved within 9 months

Note Children under 18 years should consult a healthcare professional before starting smoking-reduction regimen

Temporary abstinence

• By mouth

Child 12–18 years chew 1 piece when urge to smoke occurs between smoking episodes; max. 15 pieces daily; review treatment if unable to undertake permanent quit attempt within 6 months

Lozenges, sugar-free, nicotine (as polacrilex) 2 mg, net price pack of 36 = £5.12, pack of 72 = £9.97; 4 mg, pack of 36 = £5.12, pack of 72 = £9.97.

Contains 0.65 mmol Na⁺/lozenge. Label: 24

Excipients include aspartame (section 9.4.1)

Dose

Smoking cessation

• By mouth

Child 12–18 years initially suck 1 lozenge every 1–2 hours when urge to smoke occurs (max. 15 lozenges daily) for 6 weeks, then 1 lozenge every 2–4 hours for 3

weeks, then 1 lozenge every 4–8 hours for 3 weeks; withdraw gradually; review treatment if abstinence not achieved within 3 months

Smoking reduction

• By mouth

Child 12–18 years suck 1 lozenge when urge to smoke occurs between smoking episodes (max. 15 lozenges daily); reduce smoking within 6 weeks and attempt cessation within 6 months; review treatment if abstinence not achieved within 3 months

Note Children under 18 years should consult a healthcare professional before starting a smoking-reduction regimen

Temporary abstinence

• By mouth

Child 12–18 years suck 1 lozenge every 1–2 hours when urge to smoke occurs between smoking episodes (max. 15 lozenges daily); review treatment if unable to undertake permanent quit attempt within 6 months

Patches, self-adhesive, pink/beige, nicotine '7 mg' patch (releasing approx. 7 mg/24 hours), net price 7 = £9.97; '14 mg' patch (releasing approx. 14 mg/24 hours), 7 = £9.97; '21 mg' patch (releasing approx. 21 mg/24 hours), 7 = £9.97, 14 = £18.79

Note Also available as a clear patch

Dose

Smoking cessation

• By transdermal route

Child 12–18 years apply on waking to dry, non-hairy skin, removing after 24 hours and siting replacement patch on different area (avoid using same area for 7 days); individuals smoking 10 or more cigarettes daily, initially '21-mg' patch daily for 6 weeks then '14-mg' patch daily for 2 weeks then '7-mg' patch daily for 2 weeks. Individuals smoking less than 10 cigarettes daily, initially '14-mg' patch daily for 6 weeks then '7-mg' patch daily for 2 weeks; review treatment if abstinence not achieved within 3 months

Note Patients using the '21-mg' patch who experience excessive side-effects, which do not resolve within a few days, should change to '14-mg' patch for the remainder of the initial 6 weeks before switching to the '7-mg' patch for the final 2 weeks

4.11 Drugs for dementia

Classification not used in *BNF for Children*.

5 Infections

5.1	Antibacterial drugs	296
5.1.1	Penicillins	308
5.1.2	Cephalosporins, carbapenems, and other beta-lactams	319
5.1.3	Tetracyclines	328
5.1.4	Aminoglycosides	331
5.1.5	Macrolides	335
5.1.6	Clindamycin	339
5.1.7	Some other antibacterials	340
5.1.8	Sulphonamides and trimethoprim	346
5.1.9	Antituberculosis drugs	348
5.1.10	Antileprotic drugs	355
5.1.11	Metronidazole	355
5.1.12	Quinolones	357
5.1.13	Urinary-tract infections	360
5.2	Antifungal drugs	361
5.3	Antiviral drugs	372
5.3.1	HIV infection	372
5.3.2	Herpesvirus infections	385
5.3.3	Viral hepatitis	390
5.3.4	Influenza	390
5.3.5	Respiratory syncytial virus	392
5.4	Antiprotozoal drugs	394
5.4.1	Antimalarials	395
5.4.2	Amoebicides	407
5.4.3	Trichomonacides	408
5.4.4	Antigiardial drugs	408
5.4.5	Leishmaniocides	409
5.4.6	Trypanocides	409
5.4.7	Drugs for toxoplasmosis	409
5.4.8	Drugs for pneumocystis pneumonia	411
5.5	Anthelmintics	413
5.5.1	Drugs for threadworms	413
5.5.2	Ascaricides	414
5.5.3	Drugs for tapeworm infections	415
5.5.4	Drugs for hookworms	415
5.5.5	Schistosomicides	416
5.5.6	Filaricides	416
5.5.7	Drugs for cutaneous larva migrans	416
5.5.8	Drugs for strongyloidiasis	416

This chapter includes advice on the drug management of the following:

- anthrax, p. 357
- bacterial infections (summary of treatment and prophylaxis), p. 298–308
- Lyme disease, p. 312
- MRSA infections, p. 310
- oral infections, p. 297 and p. 302

Notifiable diseases

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

Anthrax	Ophthalmia neonatorum
Cholera	Paratyphoid fever
Diphtheria	Plague
Dysentery (amoebic or bacillary)	Poliomyelitis, acute
Encephalitis, acute	Rabies
Food poisoning	Relapsing fever
Haemorrhagic fever (viral)	Rubella
Hepatitis, viral	Scarlet fever
Leprosy	Smallpox
Leptospirosis	Tetanus
Malaria	Tuberculosis
Measles	Typhoid fever
Meningitis	Typhus
Meningococcal septicaemia (without meningitis)	Whooping cough
Mumps	Yellow fever

Note It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

5.1 Antibacterial drugs

- 5.1.1 Penicillins
- 5.1.2 Cephalosporins, carbapenems, and other beta-lactams
- 5.1.3 Tetracyclines
- 5.1.4 Aminoglycosides
- 5.1.5 Macrolides
- 5.1.6 Clindamycin
- 5.1.7 Some other antibacterials
- 5.1.8 Sulphonamides and trimethoprim
- 5.1.9 Antituberculosis drugs
- 5.1.10 Antileprotic drugs
- 5.1.11 Metronidazole
- 5.1.12 Quinolones
- 5.1.13 Urinary-tract infections

Choice of a suitable drug Before selecting an antibacterial the clinician must first consider two factors—the child and the known or likely causative organism. Factors related to the child which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age and, if an adolescent female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

The principles involved in selection of an antibacterial must allow for a number of variables including age, changing renal and hepatic function, increasing bacterial resistance, and new information on side-effects. Duration of therapy, dosage, and route of administration depend on site, type and severity of infection and response.

Antibacterial policies Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or paediatric infectious diseases specialist.

Before starting therapy The following principles should be considered before starting:

- Viral infections should not be treated with antibacterials. However, antibacterials are occasionally helpful in controlling secondary bacterial infection (e.g. acute necrotising ulcerative gingivitis secondary to herpes simplex infections);
- Samples should be taken for culture and sensitivity testing whenever possible; 'blind' antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- Knowledge of **prevalent organisms** and their current **sensitivity** is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);
- The **dose** of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection. The prescribing of the so-called 'standard' dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- The **route** of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections often require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate (e.g. in neonates and young children). Whenever possible painful intramuscular injections should be avoided in children;
- **Duration** of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or chronic osteomyelitis it is necessary to treat for prolonged periods.

Oral bacterial infections Antibacterial drugs should only be prescribed for the *treatment* of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The 'blind' prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. A sample should always be taken for bacteriology in the case of severe oral infection.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be indicated if treatment has to be delayed and they are essential in immunocompromised patients or in those with conditions such as diabetes. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig's angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or erythromycin) with metronidazole may sometimes be helpful for the treatment of severe or resistant oral infections.

See also **Penicillins** (section 5.1.1), **Cephalosporins** (section 5.1.2.1), **Tetracyclines** (section 5.1.3), **Macrolides** (section 5.1.5), **Clindamycin** (section 5.1.6), **Metronidazole** (section 5.1.11), **Fusidic acid** (section 13.10.1.2).

Superinfection In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. *fungal infections* or *antibiotic-associated colitis* (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

Therapy Suggested treatment is shown in Table 1. When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds. Infections for which prophylaxis is useful are listed in table 2.

Switching from parenteral to oral treatment The ongoing parenteral administration of an antibacterial should be reviewed regularly. In older children it may be possible to switch to an oral antibacterial; in neonates and infants this should be done more cautiously because of the relatively high incidence of bacteraemia and the possibility of variable oral absorption.

Prophylaxis Infections for which antibacterial prophylaxis is useful are listed in Table 2. In most situations, only a short course of prophylactic antibacterial is needed. Longer-term antibacterial prophylaxis is appropriate in specific indications such as vesico-ureteric reflux

Table 1. Summary of antibacterial therapy

If treating a patient suspected of suffering from a notifiable disease, the consultant in communicable disease control should be informed (see p. 296)

Gastro-intestinal system

Gastro-enteritis

Antibacterial not usually indicated

Frequently self-limiting and may not be bacterial

Campylobacter enteritis

Erythromycin¹ or ciprofloxacin

Frequently self-limiting; treat severe infection

Salmonella

Ciprofloxacin or cefotaxime

Treat invasive or severe infection; treat less severe infection in those at risk of developing invasive infection (e.g. immunocompromised, haemoglobinopathy, or child under 3 months)

Shigellosis

Azithromycin [unlicensed indication] or ciprofloxacin

Antibacterial not indicated for mild cases. Amoxicillin or trimethoprim may be used if organism sensitive

Typhoid fever

Ciprofloxacin or cefotaxime or ceftriaxone

Chloramphenicol may be an alternative; infections from Indian subcontinent, Middle-East, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested—azithromycin [unlicensed indication] may be an option in disease caused by multiple-antibacterial-resistant organisms

Clostridium difficile infection

Oral metronidazole or oral vancomycin

Treat for 7–10 days. Use vancomycin for severe infection or in patients intolerant of metronidazole. Give metronidazole by intravenous infusion if oral treatment inappropriate

Necrotising enterocolitis in neonates

Benzylpenicillin + gentamicin + metronidazole or amoxicillin² + gentamicin + metronidazole or amoxicillin² + cefotaxime + metronidazole

1. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.

2. Where amoxicillin is suggested ampicillin may be used.

Peritonitis

A cephalosporin (or amoxicillin + gentamicin) + metronidazole

Peritoneal dialysis-associated peritonitis

Either vancomycin¹ + ceftazidime added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin by mouth

Treat for 14 days or longer

Cardiovascular system**Endocarditis: initial 'blind' therapy**

Flucloxacillin (or benzylpenicillin if symptoms less severe) + gentamicin

Substitute flucloxacillin (or benzylpenicillin) with vancomycin + rifampicin if cardiac prostheses present, or if penicillin-allergic, or if methicillin-resistant *Staphylococcus aureus* suspected

Endocarditis caused by staphylococci

Flucloxacillin (or vancomycin + rifampicin if penicillin-allergic or if methicillin-resistant *Staphylococcus aureus*)

Treat for at least 4 weeks; treat prosthetic valve endocarditis for at least 6 weeks and if using flucloxacillin add rifampicin for at least 2 weeks

Endocarditis caused by streptococci (e.g. viridans streptococci)

Benzylpenicillin (or vancomycin¹ if penicillin-allergic or highly penicillin-resistant) + gentamicin

Treat endocarditis caused by fully sensitive streptococci with benzylpenicillin or vancomycin alone for 4 weeks or (if no intra-cardiac abscess or infected emboli) with benzylpenicillin + gentamicin for 2 weeks. Treat more resistant organisms for 4–6 weeks (stopping gentamicin after 2 weeks for organisms moderately sensitive to penicillin); if aminoglycoside cannot be used and if streptococci moderately sensitive to penicillin, treat with benzylpenicillin alone for 4 weeks. Treat prosthetic valve endocarditis for at least 6 weeks (stopping gentamicin after 2 weeks if organisms fully sensitive to penicillin)

Endocarditis caused by enterococci (e.g. *Enterococcus faecalis*)

Amoxicillin² (or vancomycin¹ if penicillin-allergic or penicillin-resistant) + gentamicin

Treat for at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis); if gentamicin-resistant, substitute gentamicin with streptomycin

Endocarditis caused by haemophilus, actinobacillus, cardiobacterium, eikenella, and kingella species ('HACEK' organisms)

Amoxicillin² (or ceftriaxone if amoxicillin-resistant) + gentamicin

Treat for 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

Respiratory system***Haemophilus influenzae* epiglottitis**

Cefotaxime or ceftriaxone or chloramphenicol

Uncomplicated community-acquired pneumonia

Neonate and child under 6 months, treat as for severe community acquired pneumonia of unknown aetiology

Child 6 months–5 years, oral amoxicillin² or oral erythromycin³

Child 5–18 years, oral erythromycin³ (or oral amoxicillin² if *Streptococcus pneumoniae* suspected)

Add flucloxacillin if staphylococci suspected, e.g. in influenza or measles; treat for 7 days (14–21 days for infections caused by staphylococci); pneumococci with decreased penicillin sensitivity being isolated but not yet common in UK; use erythromycin³ if atypical pathogens suspected (more common in children over 5 years) or if penicillin-allergic

Severe community-acquired pneumonia of unknown aetiology

Neonate, benzylpenicillin + gentamicin

Child 1 month–18 years, cefuroxime or co-amoxiclav (or benzylpenicillin if lobar or *Streptococcus pneumoniae* suspected)

Use erythromycin³ if atypical pathogens such as mycoplasma (more common in children over 5 years) or chlamydia suspected or if penicillin allergic; in pneumococcal infection add vancomycin to beta-lactam antibacterial if organism highly penicillin- and cephalosporin-resistant; add flucloxacillin if staphylococci suspected; treat for 10 days (14–21 days if staphylococci, legionella, or Gram-negative enteric bacilli suspected)

Pneumonia possibly caused by atypical pathogens**Erythromycin³**

Severe Legionella infections may require addition of rifampicin; tetracycline is an alternative for chlamydial and mycoplasma infections in children over 12 years; treat for at least 14 days (14–21 days for legionella)

1. Where vancomycin is suggested teicoplanin may be used.

2. Where amoxicillin is suggested ampicillin may be used.

3. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.

Hospital-acquired pneumonia

Early-onset infection (less than 5 days after admission to hospital), treat as for severe community-acquired pneumonia of unknown aetiology; if life-threatening infection or if resistant organisms suspected, treat as for late-onset hospital-acquired pneumonia

Late-onset infection (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam) or a broad-spectrum cephalosporin (e.g. ceftazidime) or another antipseudomonal beta-lactam

Treat for 7 days (longer if pseudomonas confirmed); add vancomycin if MRSA suspected; add an aminoglycoside for severe illness caused by *Pseudomonas aeruginosa*

Cystic fibrosis**Staphylococcal lung infection in cystic fibrosis**

Flucloxacillin (or erythromycin¹ or clindamycin if penicillin-allergic)

In severe exacerbation use flucloxacillin or a broad-spectrum cephalosporin (e.g. cefuroxime); substitute with vancomycin² if methicillin-resistant *Staphylococcus aureus* suspected, and if necessary, add either rifampicin or sodium fusidate

Haemophilus influenzae lung infection in cystic fibrosis

Amoxicillin or a broad-spectrum cephalosporin

In severe exacerbation use a third-generation cephalosporin (e.g. cefotaxime)

Pseudomonal lung infection in cystic fibrosis

Ciprofloxacin + nebulised colistin

In severe exacerbation treat with a parenteral aminoglycoside + an antipseudomonal beta-lactam antibacterial, and continue nebulised antibacterial

Central nervous system**Meningitis: Initial empirical therapy**

- Transfer patient urgently to hospital.
- If bacterial meningitis and especially if *meningococcal disease* suspected, general practitioners should give benzylpenicillin (see p. 309 for dose) before urgent transfer to hospital; cefotaxime (section 5.1.2) may be an alternative in penicillin allergy; chloramphenicol may be used if history of immediate hypersensitivity reaction to penicillins or to cephalosporins
- Consider adjunctive treatment with dexamethasone (section 6.3.2) starting before or with first dose of antibacterial; avoid dexamethasone in septic shock, suspected meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery
- In hospital, if aetiology unknown:
 - Neonate and Child 1–3 months*, cefotaxime + amoxicillin³
 - Child 3 months–18 years*, cefotaxime

Meningitis caused by group B streptococcus

Benzylpenicillin + gentamicin or cefotaxime alone

Treat for 14 days

Meningitis caused by meningococci

Benzylpenicillin or cefotaxime

Treat for at least 5 days; substitute chloramphenicol if history of anaphylaxis to penicillin or to cephalosporins. To eliminate nasopharyngeal carriage see Table 2, section 5.1.

Meningitis caused by pneumococci

Cefotaxime

Treat for 10–14 days; substitute benzylpenicillin if organism penicillin-sensitive; if organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin. Consider early adjunctive treatment with dexamethasone (but may reduce penetration of vancomycin into cerebrospinal fluid; section 6.3.2)

Meningitis caused by Haemophilus influenzae

Cefotaxime

Treat for at least 10 days; substitute chloramphenicol if history of anaphylaxis to penicillin or to cephalosporins or if organism resistant to cefotaxime. Consider early adjunctive treatment with dexamethasone (section 6.3.2). For *H. influenzae* type b give rifampicin for 4 days before hospital discharge (see Table 2, section 5.1)

Meningitis caused by Listeria

Amoxicillin³ + gentamicin

Treat for at least 14 days. Consider stopping gentamicin after one week

1. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.

2. Where vancomycin is suggested teicoplanin may be used.

3. Where amoxicillin is suggested ampicillin may be used.

Urinary tract

Urinary-tract infection

Child under 3 months of age, i/v amoxicillin¹ + gentamicin or i/v cephalosporin alone

Child over 3 months of age with uncomplicated lower urinary-tract infection, trimethoprim or nitrofurantoin or oral cephalosporin (e.g. cefalexin) or amoxicillin¹

Treat for 3 days. Re-assess child if unwell 24–48 hours after initial assessment. Use amoxicillin only if organism sensitive

Child over 3 months of age with acute pyelonephritis, a cephalosporin or co-amoxiclav

Treat for 7–10 days

Genital system

Syphilis

Neonatal congenital syphilis, benzylpenicillin

Treat for 10 days. Also consider treating neonates with suspected congenital syphilis whose mothers were treated inadequately for syphilis, or whose mothers were treated for syphilis in the 4 weeks before delivery, or whose mothers were treated with non-penicillin antibacterials for syphilis

Other syphilis infections, benzathine benzylpenicillin [unlicensed] or doxycycline or erythromycin

Doxycycline is an option in children over 12 years. Treat early syphilis (infection of less than 2 years) with benzathine benzylpenicillin as a single dose (repeat dose after 7 days for females in the third trimester of pregnancy) or with doxycycline or erythromycin for 14 days. Treat late latent syphilis (asymptomatic infection of more than 2 years) with doxycycline for 28 days or with benzathine benzylpenicillin once weekly for 2 weeks. Treat asymptomatic contacts of patients with infectious syphilis with doxycycline for 14 days. Contact tracing recommended

Uncomplicated gonorrhoea

Child under 12 years, ceftriaxone

Child 12–18 years, cefixime [unlicensed indication] or ciprofloxacin

Single dose treatment in uncomplicated infection. Choice depends on locality where infection acquired. Pharyngeal infection requires treatment with ceftriaxone. Use ciprofloxacin only if organism sensitive. Contact-tracing recommended; remember chlamydia

Uncomplicated genital chlamydial infection, non-gonococcal urethritis and non-specific genital infection

Child under 12 years, erythromycin for 14 days

Child 12–18 years, single dose of azithromycin or doxycycline for 7 days

Contact tracing recommended

Pelvic inflammatory disease

Child 12–18 years, doxycycline + metronidazole + i/m ceftriaxone

Treat for at least 14 days (use i/m ceftriaxone as a single dose). In severely ill patients initial treatment with doxycycline + i/v ceftriaxone (as a single dose) + i/v metronidazole, then switch to oral treatment with doxycycline + metronidazole to complete 14 days' treatment. Contact tracing recommended

Blood

Septicaemia: Initial empirical therapy

Neonate less than 48 hours old, benzylpenicillin + gentamicin or amoxicillin¹ + cefotaxime

Neonate more than 48 hours old, flucloxacillin + gentamicin or amoxicillin¹ + cefotaxime

Child 1 month–18 years, community-acquired septicaemia, aminoglycoside + amoxicillin¹ or cefotaxime alone or ceftriaxone alone

Use aminoglycoside + broad spectrum antipseudomonal beta-lactam antibacterial if pseudomonas suspected; add metronidazole if anaerobic infection suspected; add flucloxacillin or vancomycin² if Gram-positive infection suspected

Child 1 month–18 years, hospital-acquired septicaemia, a broad-spectrum anti-pseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam,

Timentin[®], ceftazidime, imipenem (with cilastatin as *Primaxin*[®]) or meropenem)

Add aminoglycoside if pseudomonas suspected, or if multiple-resistant organisms suspected, or if severe sepsis; add vancomycin² if methicillin-resistant *Staphylococcus aureus* suspected; add metronidazole to broad-spectrum cephalosporin if anaerobic infection suspected

1. Where amoxicillin is suggested ampicillin may be used.

2. Where vancomycin is suggested teicoplanin may be used.

Septicaemia related to vascular catheter**Vancomycin¹**

Add a broad-spectrum antipseudomonal beta-lactam if Gram-negative sepsis suspected, especially in the immunocompromised. Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, *Pseudomonas*, or *Candida*

Meningococcal septicaemia**Benzylpenicillin or cefotaxime**

If meningococcal disease suspected, general practitioners advised to give a single dose of benzylpenicillin before urgent transfer to hospital (see under Benzylpenicillin, section 5.1.1.1); cefotaxime (section 5.1.2) may be an alternative in penicillin allergy; chloramphenicol may be used if history of immediate hypersensitivity to penicillin or to cephalosporins. To eliminate nasopharyngeal carriage give rifampicin or ciprofloxacin before hospital discharge (see Table 2, section 5.1)

Musculoskeletal system**Osteomyelitis**

Flucloxacillin or clindamycin if penicillin-allergic (or vancomycin¹ if resistant *Staphylococcus epidermidis* or methicillin-resistant *Staph. aureus*)

Treat acute infection for 4–6 weeks and chronic infection for at least 12 weeks; if child under 5 years of age and not immunised against *Haemophilus influenzae*, add cefotaxime or ceftriaxone to flucloxacillin; combine vancomycin¹ with either fusidic acid or rifampicin if prostheses present or if life-threatening condition

Septic arthritis

Flucloxacillin or clindamycin if penicillin-allergic (or vancomycin¹ if resistant *Staphylococcus epidermidis* or methicillin-resistant *Staph. aureus*)

Treat usually for 6 weeks (longer if infection complicated or if prosthesis is present). If child under 5 years of age and not immunised against *Haemophilus influenzae*, use cefotaxime + flucloxacillin or ceftriaxone + flucloxacillin. Combine vancomycin¹ with either fusidic acid or rifampicin if prosthesis present or if life-threatening condition

Eye**Purulent conjunctivitis**

Neonate, neomycin eye drops

Child 1 month–18 years, chloramphenicol or gentamicin eye-drops

Congenital chlamydial conjunctivitis

Erythromycin (by mouth)

Treat for 14 days

Congenital gonococcal conjunctivitis

Ceftriaxone

Single-dose treatment

Ear, nose, and oropharynx**Pericoronitis**

Metronidazole or amoxicillin

Antibacterial required only in presence of systemic features of infection or of trismus or persistent swelling despite local treatment; treat for 3 days or until symptoms resolve

Acute necrotising ulcerative gingivitis

Metronidazole or amoxicillin

Antibacterial required only if systemic features of infection; treat for 3 days or until symptoms resolve

Periapical or periodontal abscess

Amoxicillin or metronidazole

Antibacterial required only in severe disease with cellulitis or if systemic features of infection; treat for 5 days

Periodontitis

Metronidazole or doxycycline

Antibacterial required for severe disease or disease unresponsive to local treatment; doxycycline is an option in children over 12 years

Throat infections

Phenoxymethylpenicillin (or erythromycin² if penicillin-allergic)

Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis; treat for 10 days. **Avoid** amoxicillin if possibility of glandular fever, see section 5.1.1.3. Initial parenteral therapy (in severe infection) with benzylpenicillin, then oral therapy with phenoxymethylpenicillin or amoxicillin³

1. Where vancomycin is suggested teicoplanin may be used.

2. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.

3. Where amoxicillin is suggested ampicillin may be used.

Sinusitis**Amoxicillin¹ or erythromycin²**

Antibacterial should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also consider antibacterial for those at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis). Treat for 7 days. Consider oral co-amoxiclav if no improvement after 48 hours. Initial parenteral therapy with co-amoxiclav or cefuroxime may be required in severe infections

Otitis externa**Flucloxacillin (or erythromycin² if penicillin-allergic)**

Consider systemic antibacterial if spreading cellulitis or child systemically unwell. Use ciprofloxacin (or an aminoglycoside) if pseudomonas suspected, see section 12.1.1

Otitis media**Amoxicillin¹ (or erythromycin² if penicillin-allergic)**

Many infections caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration, if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis present, or in children under 2 years of age with bilateral otitis media. Treat for 5 days (longer if severely ill); consider co-amoxiclav if no improvement after 48 hours; initial parenteral therapy in severe infection with co-amoxiclav or cefuroxime

Skin**Impetigo**

Topical fusidic acid (or mupirocin if meticillin-resistant *Staphylococcus aureus*); oral flucloxacillin or erythromycin² if widespread

Topical treatment for 7 days usually adequate; max. duration of topical treatment 10 days; seek local microbiology advice before using topical treatment in hospital; oral treatment for 7 days; add phenoxymethylpenicillin to flucloxacillin if streptococcal infection suspected

Erysipelas**Phenoxymethylpenicillin (or erythromycin² if penicillin-allergic)**

Add flucloxacillin to phenoxymethylpenicillin if staphylococcus suspected; substitute benzylpenicillin for phenoxymethylpenicillin if parenteral treatment required

Cellulitis**Benzylpenicillin + flucloxacillin (or erythromycin² alone if penicillin-allergic)**

Substitute phenoxymethylpenicillin for benzylpenicillin if oral treatment appropriate; discontinue flucloxacillin if streptococcal infection confirmed. Substitute treatment with broad-spectrum antibacterials if patients at risk from anaerobic or Gram-negative infections (e.g. use co-amoxiclav alone for facial infection, orbital infection, or infection caused by animal or human bites. Use ceftazidime + clindamycin in immunocompromised patients)

Animal and human bites**Co-amoxiclav alone (or clindamycin if penicillin-allergic)**

Cleanse wound thoroughly; for tetanus-prone wound, give human tetanus immunoglobulin (with adsorbed diphtheria [low dose] and tetanus vaccine if necessary, according to immunisation history and risk of infection), see under Tetanus Vaccines, section 14.4; consider rabies prophylaxis (section 14.4) for bites from animals in endemic countries; assess risk of blood-borne viruses

Acne—see section 13.6**Paronychia or 'septic spots' in neonate****Flucloxacillin**

Add aminoglycoside if systemically unwell

Surgical wound infection**Flucloxacillin or co-amoxiclav****Table 2. Summary of antibacterial prophylaxis****Prevention of recurrence of rheumatic fever**

Phenoxymethylpenicillin by mouth

Child 1 month–6 years 125 mg twice daily

Child 6–18 years 250 mg twice daily

or

Erythromycin by mouth

Child 1 month–2 years 125 mg twice daily

Child 2–18 years 250 mg twice daily

1. Where amoxicillin is suggested ampicillin may be used.

2. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.

Prevention of secondary case of invasive group A streptococcal infection¹

Phenoxymethylpenicillin by mouth

Neonate 12.5 mg/kg (max. 62.5 mg) every 6 hours for 10 days**Child 1 month–1 year** 62.5 mg every 6 hours for 10 days**Child 1–6 years** 125 mg every 6 hours for 10 days**Child 6–12 years** 250 mg every 6 hours for 10 days**Child 12–18 years** 250–500 mg every 6 hours for 10 days

If child penicillin allergic,

either erythromycin by mouth**Child 1 month–2 years** 125 mg every 6 hours for 10 days**Child 2–8 years** 250 mg every 6 hours for 10 days**Child 8–18 years** 250–500 mg every 6 hours for 10 days*or* azithromycin by mouth [unlicensed indication]**Child 6 months–12 years** 12 mg/kg (max. 500 mg) once daily for 5 days**Child 12–18 years** 500 mg once daily for 5 days**Prevention of secondary case of meningococcal meningitis²**

Rifampicin by mouth

Neonate 5 mg/kg every 12 hours for 2 days**Child 1 month–1 year** 5 mg/kg every 12 hours for 2 days**Child 1–12 years** 10 mg/kg (max. 600 mg) every 12 hours for 2 days**Child 12–18 years** 600 mg every 12 hours for 2 days*or*

Ciprofloxacin by mouth [unlicensed indication]

Child 2–5 years 125 mg as a single dose**Child 5–12 years** 250 mg as a single dose**Child 12–18 years** 500 mg as a single dose*or*

Ceftriaxone by intramuscular injection [unlicensed indication] (preferred if pregnant)

Child 1 month–12 years 125 mg as a single dose**Child 12–18 years** 250 mg as a single dose**Prevention of secondary case of Haemophilus influenzae type b disease²**

Rifampicin by mouth

Child 1–3 months 10 mg/kg once daily for 4 days**Child 3 months–12 years** 20 mg/kg (max. 600 mg) once daily for 4 days**Child 12–18 years** 600 mg once daily for 4 days**Prevention of secondary case of diphtheria in non-immune patient**

Erythromycin by mouth

Child 1 month–2 years 125 mg every 6 hours for 7 days**Child 2–8 years** 250 mg every 6 hours for 7 days**Child 8–18 years** 500 mg every 6 hours for 7 days

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment

1. For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Health Protection Agency Laboratory)
2. For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Health Protection Agency laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Prevention of secondary case of pertussis in non-immune patient or partially immune patientErythromycin¹ by mouth**Child 1 month–2 years** 125 mg every 6 hours for 7 days**Child 2–8 years** 250 mg every 6 hours for 7 days**Child 8–18 years** 250–500 mg every 6 hours for 7 days**Note** Pertussis vaccine inappropriate for outbreak since 3 injections required for protection**Prevention of pneumococcal infection in asplenia or in patients with sickle cell disease**

Phenoxymethylpenicillin by mouth

Child 1 month–6 years 125 mg every 12 hours**Child 6–12 years** 250 mg every 12 hours**Child 12–18 years** 500 mg every 12 hoursIf cover also needed for *H. influenzae* in child give amoxicillin instead**Child 1 month–5 years** 125 mg every 12 hours**Child 5–12 years** 250 mg every 12 hours**Child 12–18 years** 500 mg every 12 hours**Note** Antibiotic prophylaxis is not fully reliable; for vaccines in asplenia see p. 727**Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis**

Flucloxacillin by mouth

Child 1 month–18 years 12.5–25 mg/kg (max. 1 g) 4 times daily (total daily dose may alternatively be given in 2 divided doses)

Use cefradine (section 5.1.2) if flucloxacillin cannot be used

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive²

Isoniazid for 6 months

Neonate 5 mg/kg daily**Child 1 month–12 years** 5 mg/kg daily (max. 300 mg daily)**Child 12–18 years** 300 mg daily

or isoniazid + rifampicin for 3 months

Child 1 month–12 years isoniazid 5 mg/kg daily (max. 300 mg daily) + rifampicin 10 mg/kg daily (max. 450 mg daily if body-weight less than 50 kg; max. 600 mg daily if body-weight over 50 kg)**Child 12–18 years** isoniazid 300 mg daily + rifampicin 600 mg daily (rifampicin 450 mg daily if body-weight less than 50 kg)

or (if isoniazid-resistant tuberculosis) rifampicin for 6 months

Child 1 month–12 years 10 mg/kg daily (max. 450 mg daily if body-weight less than 50 kg; max. 600 mg daily if body-weight over 50 kg)**Child 12–18 years** 600 mg daily (450 mg daily if body-weight less than 50 kg)

1. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.
2. For details of those who should receive chemoprophylaxis contact the lead clinician for local tuberculosis services (or a consultant in communicable disease control). See also section 5.1.9, for advice on immunocompromised patients and on prevention of tuberculosis

Prevention of gas-gangrene in high lower-limb amputations or following major trauma

i/v benzylpenicillin

Child 1 month–12 years 25 mg/kg (max. 600mg) every 6 hours for 5 days**Child 12–18 years** 300–600 mg every 6 hours for 5 days

or if penicillin-allergic i/v or oral metronidazole

Child 1 month–12 years 7.5mg/kg (max. 500mg) every 8 hours for 5 days**Child 12–18 years** 400–500 mg every 8 hours for 5 days**Prevention of infection in gastro-intestinal procedures**

Operations on stomach or oesophagus

Single dose¹ of i/v gentamicin or i/v cefuroxime

Open biliary surgery

Single dose¹ of i/v cefuroxime + i/v metronidazole² or i/v gentamicin + i/v metronidazole²

Resections of colon and rectum, and resections in inflammatory bowel disease, and appendectomy

Single dose¹ of i/v gentamicin + i/v metronidazole² or i/v cefuroxime + i/v metronidazole² or i/v co-amoxiclav alone

Endoscopic retrograde cholangiopancreatography

Single dose of i/v gentamicin or oral or i/v ciprofloxacin

Prophylaxis particularly recommended if bile stasis, pancreatic pseudocyst, previous cholangitis or neutropenia

Prevention of infection in orthopaedic surgery

Management of fractures

Single dose¹ of i/v cefuroxime or i/v flucloxacillinSubstitute i/v vancomycin if history of allergy to penicillins or to cephalosporins or if high risk of methicillin-resistant *Staphylococcus aureus*; use cefuroxime + metronidazole for complex open fractures with extensive soft-tissue damage; prophylaxis continued for 24 hours in open fractures (longer if complex open fractures)**Prevention of infection in obstetric surgery**

Termination of pregnancy

Single dose¹ of oral metronidazole

If genital chlamydial infection cannot be ruled out, give doxycycline (section 5.1.3) postoperatively

Prevention of infection in vascular surgery

Reconstructive arterial surgery of abdomen, pelvis or legs

Single dose¹ of i/v cefuroximeAdd i/v metronidazole for patients at risk from anaerobic infections including those with diabetes, gangrene or undergoing amputation; add i/v vancomycin if high risk of methicillin-resistant *Staphylococcus aureus*

1. Additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss
2. Metronidazole may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery

Prevention of endocarditis

NICE Guidance

Antimicrobial prophylaxis against infective endocarditis in children and adults undergoing interventional procedures (March 2008)

Antibacterial prophylaxis and chlorhexidine mouthwash are **not** recommended for the prevention of endocarditis in patients undergoing dental procedures.

Antibacterial prophylaxis is **not** recommended for the prevention of endocarditis in patients undergoing procedures of the:

- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

While these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis¹ should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis¹ are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

Patients at risk of endocarditis¹ should be:

- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Dermatological procedures

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures² do not require antibacterial prophylaxis against endocarditis.

Joint prostheses and dental treatment

Joint prostheses and dental treatment

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibacterial prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibacterials when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibacterials to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

1. Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

2. The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibacterial prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

5.1.1 Penicillins**5.1.1.1 Benzylpenicillin and phenoxymethylpenicillin****5.1.1.2 Penicillinase-resistant penicillins****5.1.1.3 Broad-spectrum penicillins****5.1.1.4 Antipseudomonal penicillins****5.1.1.5 Mecillinams**

The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

Hypersensitivity reactions The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Children who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. As patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics; aztreonam may be less likely to cause hypersensitivity in penicillin-sensitive patients and can be used with caution. If a penicillin (or another beta-lactam antibiotic) is essential in a child with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity (see also p. 319).

Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation. This may result from excessively high doses or in patients with severe renal failure. The penicillins should **not** be given by intrathecal injection because they can cause encephalopathy which may be fatal.

Another problem relating to high doses of penicillin, or normal doses given to patients with renal failure, is the accumulation of electrolyte since most injectable penicillins contain either sodium or potassium.

Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.

5.1.1.1 Benzylpenicillin and phenoxymethylpenicillin

Benzylpenicillin (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also

for anthrax (section 5.1.12), diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease (section 5.1.1.3) in children. It is also used in combination with gentamicin for the empirical treatment of sepsis in neonates less than 48 hours old. Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; **benzylpenicillin is no longer the drug of first choice for pneumococcal meningitis**. Although benzylpenicillin is effective in the treatment of tetanus, metronidazole (section 5.1.11) is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gastro-intestinal tract is low; therefore it must be given by injection.

Benzathine benzylpenicillin (available from 'special-order' manufacturers or specialist importing companies, see p.943) is used for the treatment of early syphilis and late latent syphilis.

Phenoxymethylpenicillin (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle cell disease.

Oral infections Phenoxymethylpenicillin is effective for dentoalveolar abscess.

BENZYLPENICILLIN SODIUM

(Penicillin G)

Cautions history of allergy; false-positive urinary glucose (if tested for reducing substances); **interactions:** Appendix 1 (penicillins)

Renal impairment neurotoxicity—high doses may cause convulsions. Estimated glomerular filtration rate 10–50 mL/minute/1.73 m², use normal dose every 8–12 hours; estimated glomerular filtration rate less than 10 mL/minute/1.73 m² use normal dose every 12 hours

Pregnancy not known to be harmful

Breast-feeding trace amounts in breast milk—not known to be harmful but be alert for hypersensitivity in infant

Contra-indications penicillin hypersensitivity

Side-effects hypersensitivity reactions including urticaria, fever, joint pains, rashes, angioedema, anaphylaxis, serum sickness-like reactions; *rarely* CNS toxicity including convulsions (especially with high doses or in severe renal impairment), interstitial nephritis, haemolytic anaemia, leucopenia, thrombocytopenia and coagulation disorders; also reported diarrhoea (including antibiotic-associated colitis)

Indication and dose

Mild to moderate susceptible infections (including throat infections, otitis media, pneumonia, cellulitis, neonatal sepsis, Table 1, section 5.1)

- By intramuscular injection or by slow intravenous injection or infusion (intravenous route recommended in neonates and infants)

Preterm neonate and neonate under 7 days 25 mg/kg every 12 hours; dose doubled in severe infection

Neonate 7–28 days 25 mg/kg every 8 hours; dose doubled in severe infection

Child 1 month–18 years 25 mg/kg every 6 hours; increased to 50 mg/kg every 4–6 hours (max. 2.4 g every 4 hours) in severe infection

Endocarditis (combined with another antibacterial if necessary, see Table 1, section 5.1)

- **By slow intravenous injection or infusion**
Child 1 month–18 years 25 mg/kg every 4 hours, increased if necessary to 50 mg/kg (max. 2.4 g) every 4 hours

Meningitis, meningococcal disease

- **By slow intravenous injection or infusion**

Preterm neonate and neonate 75 mg/kg every 8 hours

Child 1 month–18 years 50 mg/kg every 4–6 hours (max. 2.4 g every 4 hours)

Important. If bacterial meningitis and especially if meningococcal disease is suspected general practitioners are advised to give a single injection of benzylpenicillin by intravenous injection (or by intramuscular injection) before transferring the patient urgently to hospital. Suitable doses are: **Infant under 1 year** 300 mg; **Child 1–9 years** 600 mg, 10 years and over 1.2 g. In penicillin allergy, cefotaxime (section 5.1.2) may be an alternative; chloramphenicol may be used if there is a history of anaphylaxis to penicillins

Treatment or prevention of neonatal group B streptococcus infection

- **By slow intravenous injection or infusion**

Preterm neonate and neonate under 7 days 50 mg/kg every 12 hours

Neonate 7–28 days 50 mg/kg every 8 hours

Prophylaxis in limb amputation Table 2, section 5.1

▢ BENZYL PENICILLIN SODIUM (continued)

Administration Intravenous route recommended in neonates and infants. For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity

Safe practice Intrathecal injection of benzylpenicillin is not recommended

Crystapen® (Genus) (POM)

Injection, powder for reconstitution, benzylpenicillin sodium (unbuffered), net price 600-mg vial = 46p, 2-vial 'GP pack' = £1.90; 1.2-g vial = 92p
Electrolytes Na⁺ 1.68 mmol/600-mg vial; 3.36 mmol/1.2-g vial

PHENOXYMETHYL PENICILLIN

(Penicillin V)

Cautions see under Benzylpenicillin; **interactions:** Appendix 1 (penicillins)

Renal impairment no dose adjustment required

Contra-indications see under Benzylpenicillin

Side-effects see under Benzylpenicillin

Indication and dose

Susceptible infections including oral infections, tonsillitis, otitis media, erysipelas, cellulitis

• **By mouth**

Child 1 month–1 year 62.5 mg 4 times daily; increased in severe infection to ensure at least 12.5 mg/kg 4 times daily

Child 1–6 years 125 mg 4 times daily; increased in severe infection to ensure at least 12.5 mg/kg 4 times daily

Child 6–12 years 250 mg 4 times daily; increased in severe infection to ensure at least 12.5 mg/kg 4 times daily

Child 12–18 years 500 mg 4 times daily; increased in severe infection up to 1 g 4 times daily

Prevention of pneumococcal infection in asplenia or sickle cell disease, see Table 2, section 5.1

Prevention of recurrence of rheumatic fever, see Table 2, section 5.1

Prevention of group A streptococcal infection, see Table 2, section 5.1

Phenoxymethylpenicillin (Non-proprietary) (POM)

Tablets, phenoxymethylpenicillin (as potassium salt) 250 mg, net price 28-tab pack = £1.25. Label: 9, 23

Oral solution, phenoxymethylpenicillin (as potassium salt) for reconstitution with water, net price 125 mg/5 mL, 100 mL = £1.90; 250 mg/5 mL, 100 mL = £2.59. Label: 9, 23

Dental prescribing on NHS Phenoxymethylpenicillin Tablets and Oral Solution may be prescribed

5.1.1.2 Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. **Flucloxacillin**, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the main indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection.

Flucloxacillin is well absorbed from the gut. For CSM warning on cholestatic jaundice see under Flucloxacillin.

MRSA Infection from *Staphylococcus aureus* strains resistant to methicillin [now discontinued] (methicillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin (section 5.1.9) or **sodium fusidate** (section 5.1.7) should not be used alone because resistance may develop rapidly. **Clindamycin** alone or a combination of rifampicin and sodium fusidate can be used for *skin and soft-tissue infections* caused by MRSA; a **tetracycline** is an alternative in children over 12 years of age. A **glycopeptide** (e.g. vancomycin, section 5.1.7) can be used for severe skin and soft-tissue infections associated with MRSA. A combination of a glycopeptide and sodium fusidate or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial. **Linezolid** (section 5.1.7) or the combination of the streptogramin antibiotics **quinupristin** and **dalfopristin** (section 5.1.7) should be reserved for skin and soft-tissue infections that have not responded to other antibacterials or for children who cannot tolerate other antibacterials.

A **glycopeptide** can be used for *pneumonia* associated with MRSA. **Linezolid** or **quinupristin** and **dalfopristin** should be reserved for hospital-acquired pneumonia that has not responded to other antibacterials or for children who cannot tolerate other antibacterials.

Trimethoprim or **nitrofurantoin** can be used for *urinary-tract infections* caused by MRSA; a **tetracycline** is an alternative in children over 12 years of age. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for *septicaemia* associated with MRSA.

For the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA, see Table 1, section 5.1.

Prophylaxis with vancomycin or teicoplanin (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient's MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

It is important that hospitals have infection control guidelines to minimise MRSA transmission, including policies on isolation and treatment of MRSA carriers and on hand hygiene. For eradication of nasal carriage of MRSA, see section 12.2.3.

FLUCLOXACILLIN

Cautions see under Benzylpenicillin (section 5.1.1.1); also hepatic impairment (see CSM advice below)

CSM advice (hepatic disorders) CSM has advised that very rarely cholestatic jaundice and hepatitis may occur up to several weeks after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. CSM has reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
- flucloxacillin should be used with caution in patients with hepatic impairment;
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

Renal impairment use normal dose every 8 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Pregnancy not known to be harmful

Breast-feeding trace amounts in breast milk—not known to be harmful but be alert for hypersensitivity in infant

Contra-indications see under Benzylpenicillin (section 5.1.1.1)

Side-effects see under Benzylpenicillin (section 5.1.1.1); also gastro-intestinal disturbances; very rarely hepatitis and cholestatic jaundice reported (see also CSM advice above)

Indication and dose

Infections due to beta-lactamase-producing staphylococci including otitis externa; adjunct in pneumonia, impetigo, cellulitis

- **By mouth**

Neonate under 7 days 25 mg/kg twice daily

Neonate 7–21 days 25 mg/kg 3 times daily

Neonate 21–28 days 25 mg/kg 4 times daily

Child 1 month–2 years 62.5–125 mg 4 times daily

Child 2–10 years 125–250 mg 4 times daily

Child 10–18 years 250–500 mg 4 times daily

- **By intramuscular injection**

Child 1 month–18 years 12.5–25 mg/kg every 6 hours (max. 500 mg every 6 hours)

- **By slow intravenous injection or by intravenous infusion**

Neonate under 7 days 25 mg/kg every 12 hours; may be doubled in severe infection

Neonate 7–21 days 25 mg/kg every 8 hours; may be doubled in severe infection

Neonate 21–28 days 25 mg/kg every 6 hours; may be doubled in severe infection

Child 1 month–18 years 12.5–25 mg/kg every 6 hours (max. 1 g every 6 hours); may be doubled in severe infection

- **Osteomyelitis (Table 1, section 5.1), cerebral abscess, staphylococcal meningitis**

- **By slow intravenous injection or by intravenous infusion**

Neonate under 7 days 50–100 mg/kg every 12 hours

Neonate 7–21 days 50–100 mg/kg every 8 hours

Neonate 21–28 days 50–100 mg/kg every 6 hours

Child 1 month–18 years 50 mg/kg (max. 2 g) every 6 hours

▢ FLUCLOXACILLIN (continued)

Endocarditis (Table 1, section 5.1)

- By slow intravenous injection or by intravenous infusion

Child 1 month–18 years 50 mg/kg (max. 2 g) every 6 hours

Prevention of staphylococcal lung infection in cystic fibrosis

Table 2, section 5.1

Staphylococcal lung infection in cystic fibrosis

- By mouth

Child 1 month–18 years 12.5–25 mg/kg (max. 1 g) 4 times daily; total daily dose may alternatively be given in 3 divided doses

Administration for *intermittent intravenous infusion*, dilute reconstituted solution in Glucose 5% or Sodium Chloride 0.9% and give over 30–60 minutes; alternatively, may be given *via drip tub-*

ing in Glucose 5% or Sodium Chloride 0.9% or Ringer's Solution or Compound Sodium Lactate

Flucloxacillin (Non-proprietary) ^(PmL)

Capsules, flucloxacillin (as sodium salt) 250 mg, net price 28 = £2.38; 500 mg, 28 = £4.30. Label: 9, 23 Brands include *Floxapen*[®], *Fluclomix*[®], *Ladropen*[®]

Oral solution (= elixir or syrup), flucloxacillin (as sodium salt) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £2.97; 250 mg/5 mL, 100 mL = £8.84. Label: 9, 23

Suspension (= syrup), flucloxacillin (as magnesium salt) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £3.25; 250 mg/5 mL, 100 mL = £6.48. Label: 9, 23 Brands include *Floxapen*[®]

Injection, powder for reconstitution, flucloxacillin (as sodium salt). Net price 250-mg vial = £1.23; 500-mg vial = £2.45; 1-g vial = £4.90

5.1.1.3 Broad-spectrum penicillins

Ampicillin is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Ampicillin is also active against *Listeria* spp. and enterococci. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the 'blind' treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin can be given by mouth, but less than half the dose is absorbed and absorption is further decreased by the presence of food in the gut. Ampicillin is well excreted in the bile and urine.

Amoxicillin (amoxycillin) is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach.

Amoxicillin or ampicillin are principally indicated for the treatment of community-acquired pneumonia and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections (section 5.1.13). They are also used in the treatment of endocarditis and listerial meningitis. Amoxicillin may also be used for the treatment of Lyme disease [not licensed], see below.

Maculopapular rashes occur commonly with ampicillin (and amoxicillin) but are not usually related to true penicillin allergy. They often occur in children with glandular fever; broad-spectrum penicillins should not therefore be used for 'blind' treatment of a sore throat. Rashes are also common in children with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Co-amoxiclav consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains; for CSM warning on cholestatic jaundice see under Co-amoxiclav.

A combination of ampicillin with flucloxacillin (as co-fluampicil) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

Lyme disease Lyme disease should generally be treated by those experienced in its management. **Amoxicillin** [unlicensed indication], **cefuroxime axetil** or **doxycycline** are the antibacterials of choice for *early Lyme disease* or *Lyme arthritis*

but doxycycline should only be used in children over 12 years of age. If these antibacterials are contra-indicated a **macrolide** (e.g. erythromycin) can be used for early Lyme disease. Intravenous administration of **ceftriaxone**, **cefotaxime** (section 5.1.2.1), or **benzylpenicillin** (p. 309) is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

Oral infections Amoxicillin or ampicillin are as effective as phenoxymethylpenicillin (section 5.1.1.1) but they are better absorbed; however, they may encourage emergence of resistant organisms.

Like phenoxymethylpenicillin, amoxicillin and ampicillin are ineffective against bacteria that produce beta-lactamases.

AMOXICILLIN

(Amoxicillin)

Cautions see under Ampicillin; maintain adequate hydration with high doses (particularly during parenteral therapy)

Renal impairment risk of crystalluria with high doses (particularly during parenteral therapy) in mild to moderate impairment; reduce dose in severe impairment; rashes more common and risk of crystalluria

Contra-indications see under Ampicillin

Side-effects see under Ampicillin

Indication and dose

Susceptible infections including urinary-tract infections, sinusitis; *Haemophilus influenzae* infections

- By mouth

Neonate under 7 days 30 mg/kg (max. 62.5 mg) twice daily; dose doubled in severe infection

Neonate 7–28 days 30 mg/kg (max. 62.5 mg) 3 times daily; dose doubled in severe infection

Child 1 month–1 year 62.5 mg 3 times daily; dose doubled in severe infection

Child 1–5 years 125 mg 3 times daily; dose doubled in severe infection

Child 5–18 years 250 mg 3 times daily; dose doubled in severe infection

- By intramuscular injection

Child 1 month–18 years 30 mg/kg every 8 hours (max. 500 mg every 8 hours)

- By intravenous injection or infusion

Neonate under 7 days 30 mg/kg every 12 hours; dose doubled in severe infection

Neonate 7–28 days 30 mg/kg every 8 hours; dose doubled in severe infection

Child 1 month–18 years 20–30 mg/kg (maximum 500 mg) every 8 hours; dose doubled in severe infection (max. 4 g daily)

Uncomplicated community-acquired pneumonia (Table 1, section 5.1), invasive salmonellosis

- By mouth

Child 1 month–1 year 125 mg 3 times daily

Child 1–5 years 250 mg 3 times daily

Child 5–18 years 500 mg 3 times daily

- By slow intravenous injection or by intravenous infusion

Neonate under 7 days 50 mg/kg every 12 hours

Neonate 7–28 days 50 mg/kg every 8 hours

Child 1 month–18 years 30 mg/kg every 8 hours; dose doubled in severe infection (max. 4 g daily)

Listerial meningitis (in combination with another antibacterial, Table 1, section 5.1), group B streptococcal infection, enterococcal endocarditis (in combination with another antibiotic)

- By intravenous infusion

Neonate under 7 days 50 mg/kg every 12 hours; dose may be doubled in meningitis

Neonate 7–28 days 50 mg/kg every 8 hours; dose may be doubled in meningitis

Child 1 month–18 years 50 mg/kg every 4–6 hours (max. 2 g every 4 hours)

Otitis media

- By mouth

Child 1 month–18 years 40 mg/kg daily in 3 divided doses (max. 3 g daily in 3 divided doses)

Cystic fibrosis (treatment of asymptomatic *H. influenzae* carriage or mild exacerbations)

- By mouth

Child 1 month–1 year 125 mg 3 times daily

Child 1–7 years 250 mg 3 times daily

Child 7–18 years 500 mg 3 times daily

***Helicobacter pylori* eradication** section 1.3

Administration Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50 mg/mL (100 mg/mL for neonates). May be further diluted with Glucose 5% or Glucose 10% or Sodium chloride 0.9% or 0.45% for intravenous infusion. Give intravenous infusion over 30 minutes when using doses over 30 mg/kg

▢ AMOXICILLIN (continued)

Amoxicillin (Non-proprietary) (PoM)

Capsules, amoxicillin (as trihydrate) 250 mg, net price 21 = £1.14 ; 500 mg, 21 = £1.56. Label: 9
Brands include *Amix*®, *Amoram*®, *Amoxident*®, *Galenamox*®, *Rimoxallin*®

Oral suspension, amoxicillin (as trihydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.37; 250 mg/5 mL, 100 mL = £1.54. Label: 9

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription
Brands include *Amoram*®, *Galenamox*®, *Rimoxallin*®

Sachets, sugar-free, amoxicillin (as trihydrate) 3 g/sachet, net price 2-sachet pack = £5.56, 14-sachet pack = £31.94. Label: 9, 13

Injection, powder for reconstitution, amoxicillin (as sodium salt), net price 250-mg vial = 32p; 500-mg vial = 66p; 1-g vial = £1.16

Dental prescribing on NHS Amoxicillin Capsules and Oral Suspension may be prescribed. Amoxicillin Sachets may be prescribed as Amoxicillin Oral Powder

Amoxil® (GSK) (PoM)

Capsules, both maroon/gold, amoxicillin (as trihydrate), 250 mg, net price 21-cap pack = £3.59; 500 mg, 21-cap pack = £7.19. Label: 9

Paediatric suspension, amoxicillin 125 mg (as trihydrate)/1.25 mL when reconstituted with water, net price 20 mL (peach- strawberry- and lemon-flavoured) = £3.38. Label: 9, counselling , use of pipette

Excipients include sucrose 600 mg/1.25 mL

Sachets SF, powder, sugar-free, amoxicillin (as trihydrate) 3 g/sachet, 2-sachet pack (peach- strawberry- and lemon-flavoured) = £2.99. Label: 9, 13

Injection, powder for reconstitution, amoxicillin (as sodium salt), net price 500-mg vial = 58p; 1-g vial = £1.16

Electrolytes Na⁺ 3.3 mmol/g

AMPICILLIN

Cautions history of allergy; erythematous rashes common in glandular fever, cytomegalovirus infection, and acute or chronic lymphocytic leukaemia (see notes above); **interactions:** Appendix 1 (penicillins)

Renal impairment if estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency—rashes more common

Pregnancy not known to be harmful

Breast-feeding trace amounts in breast milk—not known to be harmful but be alert for hypersensitivity in infant

Contra-indications penicillin hypersensitivity

Side-effects nausea, vomiting, diarrhoea; rashes (discontinue treatment); rarely, antibiotic-associated colitis; see also under Benzylpenicillin (section 5.1.1.1)

Indication and dose

Susceptible infections including urinary-tract infections, otitis media, sinusitis, oral infections (Table 1, section 5.1), Haemophilus influenzae infections, invasive salmonellosis

• By mouth

Neonate under 7 days 30 mg/kg (max. 62.5 mg) twice daily; dose doubled in severe infection

Neonate 7–21 days 30 mg/kg (max. 62.5 mg) 3 times daily; dose doubled in severe infection

Neonate 21–28 days 30 mg/kg (max. 62.5 mg) 4 times daily; dose doubled in severe infection

Child 1 month–1 year 62.5 mg 4 times daily; dose doubled in severe infection

Child 1–5 years 125 mg 4 times daily; dose doubled in severe infection

Child 5–12 years 250 mg 4 times daily; dose doubled in severe infection

Child 12–18 years 500 mg 4 times daily; dose doubled in severe infection

• By intramuscular injection

Child 1 month–18 years 25 mg/kg (max. 500 mg) every 6 hours

• By intravenous injection or infusion

Neonate under 7 days 30 mg/kg every 12 hours; dose doubled in severe infection

Neonate 7–21 days 30 mg/kg every 8 hours; dose doubled in severe infection

Neonate 21–28 days 30 mg/kg every 6 hours; dose doubled in severe infection

Child 1 month–18 years 25 mg/kg (max. 1 g) every 6 hours; dose doubled in severe infection

Uncomplicated community-acquired pneumonia (Table 1, section 5.1), invasive salmonellosis

• By mouth

Child 1 month–1 year 125 mg 4 times daily

Child 1–5 years 250 mg 4 times daily

Child 5–18 years 500 mg 4 times daily

• By slow intravenous injection or by intravenous infusion

Neonate under 7 days 50 mg/kg every 12 hours

Neonate 7–21 days 50 mg/kg every 8 hours

Neonate 21–28 days 50 mg/kg every 6 hours

Child 1 month–18 years 50 mg/kg (max. 1 g) every 6 hours

▢ AMPICILLIN (continued)

Listeria meningitis, group B streptococcal infection, enterococcal endocarditis (in combination with another antibacterial, see Table 1, section 5.1)

• **By intravenous infusion**

Neonate under 7 days 50 mg/kg every 12 hours; dose doubled in meningitis

Neonate 7–21 days 50 mg/kg every 8 hours; dose doubled in meningitis

Neonate 21–28 days 50 mg/kg every 6 hours; dose doubled in meningitis

Child 1 month–18 years 50 mg/kg every 4–6 hours (max. 2 g every 4 hours)

Administration *Oral* administer at least 30 minutes before food

Injection: displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50–100 mg/mL. May be further diluted with glucose 5% or 10% or sodium chloride 0.9% or 0.45% for infusion. Give over 30 minutes when using doses of greater than 50 mg/kg to avoid CNS toxicity including convulsions.

Ampicillin (Non-proprietary) ^(Pm)

Capsules, ampicillin 250 mg, net price 28 = £3.88; 500 mg, 28 = £19.68. Label: 9, 23
Brands include *Rimacillin*[®]

Oral suspension, ampicillin 125 mg/5 mL when reconstituted with water, net price 100 mL = £3.38; 250 mg/5 mL, 100 mL = £6.61. Label: 9, 23
Brands include *Rimacillin*[®]

Injection, powder for reconstitution, ampicillin (as sodium salt), net price 500-mg vial = £7.83

Dental prescribing on NHS Ampicillin Capsules and Oral Suspension may be prescribed

Penbritin[®] (Chemidex) ^(Pm)

Capsules, both grey/red, ampicillin (as trihydrate) 250 mg, net price 28-cap pack = £2.10; 500 mg, 28-cap pack = £5.28. Label: 9, 23

Syrup, apricot- caramel- and peppermint-flavoured, ampicillin (as trihydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £3.78; 250 mg/5 mL, 100 mL = £7.39. Label: 9, 23
Excipients include sucrose 3.6 g/5 mL

▣ **With flucloxacillin**

Co-fluampicil (Non-proprietary) ^(Pm)

Capsules, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as trihydrate), net price 28-cap pack = £14.43. Label: 9, 22
Brands include *Flu-Amp*[®]

Magnapen[®] (CP) ^(Pm)

Capsules, black/turquoise, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as trihydrate), net price 20-cap pack = £4.00. Label: 9, 22

Syrup, co-fluampicil 125/125 (flucloxacillin 125 mg as magnesium salt, ampicillin 125 mg as trihydrate)/5 mL when reconstituted with water, net price 100 mL = £4.99. Label: 9, 22
Excipients include sucrose 3.14 g/5 mL

Injection 500 mg, powder for reconstitution, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as sodium salt), net price per vial = £1.33

Electrolytes Na⁺ 1.3 mmol/vial

CO-AMOXICLAV

A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form *x/y* where *x* and *y* are the strengths in milligrams of amoxicillin and clavulanic acid respectively

Cautions see under Ampicillin and notes above; also caution in hepatic impairment (monitor hepatic function); maintain adequate hydration with high doses (particularly during parenteral therapy)

Cholestatic jaundice CSM has advised that cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days

Hepatic impairment monitor liver function in liver disease. See also Cholestatic Jaundice above

Renal impairment *Oral:* use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use half normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². *Augmentin-Duo*[®] not recommended if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Intravenous: use normal initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use normal initial dose and then use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Pregnancy not known to be harmful

Breast-feeding trace amounts present in breast milk—not known to be harmful but be alert for hypersensitivity in the infant

Contra-indications penicillin hypersensitivity, history of co-amoxiclav-associated or penicillin-associated jaundice or hepatic dysfunction

Side-effects see under Ampicillin; hepatitis, cholestatic jaundice (see above); Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, vasculitis reported; rarely prolongation of bleeding time, dizziness, headache, convulsions (particularly with high doses or in renal impairment); superficial staining of teeth with suspension, phlebitis at injection site

□ CO-AMOXICLAV (continued)

Indication and dose

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, genito-urinary and abdominal infections, cellulitis, animal bites

- By mouth, expressed as co-amoxiclav (see also under *Augmentin-Duo*[®] preparation below)

Neonate 0.25 mL/kg of 125/31 suspension 3 times daily

Child 1 month–1 year 0.25 mL/kg of 125/31 suspension 3 times daily; dose doubled in severe infection

Child 1–6 years 5 mL of 125/31 suspension 3 times daily or 0.25 mL/kg of 125/31 suspension 3 times daily; dose doubled in severe infection

Child 6–12 years 5 mL of 250/62 suspension 3 times daily or 0.15 mL/kg of 250/62 suspension 3 times daily; dose doubled in severe infection

Child 12–18 years one 250/125 strength tablet 3 times daily; increased in severe infections to one 500/125 strength tablet, 3 times daily

- By intravenous injection over 3–4 minutes or by intravenous infusion, expressed as co-amoxiclav

Preterm neonate and neonate under 7 days 30 mg/kg every 12 hours

Neonate 7–28 days 30 mg/kg every 8 hours

Child 1–3 months 30 mg/kg every 8 hours

Child 3 months–12 years 30 mg/kg every 8 hours increased in more serious infections to 30 mg/kg every 6 hours

Child 12–18 years 1.2 g every 8 hours increased in more serious infections to 1.2 g every 6 hours

- **Severe dental infections** (but not generally first-line, see notes above), expressed as co-amoxiclav

- By mouth

Child 12–18 years one 250/125 strength tablet every 8 hours for 5 days

Administration for *intermittent intravenous infusion* dilute reconstituted solution to a concentration of 10mg/mL with Sodium Chloride 0.9% or Water for Injections; give over 30–40 minutes and complete infusion within 4 hours of reconstitution.

Co-amoxiclav (Non-proprietary) ^(PM)

Tablets, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £3.04. Label: 9

Dental prescribing on NHS Co-amoxiclav 250/125 Tablets may be prescribed

Tablets, co-amoxiclav 500/125 (amoxicillin 500 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £6.32. Label: 9

Oral suspension, co-amoxiclav 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg

as potassium salt)/5 mL when reconstituted with water, net price 100 mL = £3.07. Label: 9

Oral suspension, co-amoxiclav 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL = £3.87. Label: 9

Injection 500/100, powder for reconstitution, co-amoxiclav 500/100 (amoxicillin 500 mg as sodium salt, clavulanic acid 100 mg as potassium salt), net price per vial = £1.21

Injection 1000/200, powder for reconstitution, co-amoxiclav 1000/200 (amoxicillin 1 g as sodium salt, clavulanic acid 200 mg as potassium salt), net price per vial = £2.42

Augmentin[®] (GSK) ^(PM)

Tablets 375 mg, f/c, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £4.45. Label: 9

Tablets 625 mg, f/c, co-amoxiclav 500/125 (amoxicillin 500 mg as trihydrate, clavulanic acid 125 mg as potassium salt). Net price 21-tab pack = £8.49. Label: 9

Dispersible tablets, sugar-free, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt). Net price 21-tab pack = £10.22. Label: 9, 13

Suspension '125/31 SF', sugar-free, co-amoxiclav 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31 mg as potassium salt)/5 mL when reconstituted with water. Net price 100 mL (raspberry- and orange-flavoured) = £4.25. Label: 9
Excipients include aspartame 12.5 mg/5 mL (section 9.4.1)

Suspension '250/62 SF', sugar-free, co-amoxiclav 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62 mg as potassium salt)/5 mL when reconstituted with water. Net price 100 mL (raspberry- and orange-flavoured) = £5.97. Label: 9
Excipients include aspartame 12.5 mg/5 mL (section 9.4.1)

Injection 600 mg, powder for reconstitution, co-amoxiclav 500/100 (amoxicillin 500 mg as sodium salt, clavulanic acid 100 mg as potassium salt). Net price per vial = £1.38

Electrolytes Na⁺ 1.35 mmol, K⁺ 0.5 mmol/600-mg vial

Injection 1.2 g, powder for reconstitution, co-amoxiclav 1000/200 (amoxicillin 1 g as sodium salt, clavulanic acid 200 mg as potassium salt). Net price per vial = £2.76

Electrolytes Na⁺ 2.7 mmol, K⁺ 1 mmol/1.2-g vial

Augmentin-Duo[®] (GSK) ^(PM)

Suspension '400/57', sugar-free, strawberry-flavoured, co-amoxiclav 400/57 (amoxicillin 400 mg as trihydrate, clavulanic acid 57 mg as potassium salt)/5 mL when reconstituted with water. Net price 35 mL = £4.38, 70 mL = £6.15. Label: 9

Excipients include aspartame 12.5 mg/5 mL (section 9.4.1)

Dose

Child 2 months–2 years 0.15 mL/kg twice daily, doubled in severe infection

Child 2–6 years (13–21 kg) 2.5 mL twice daily, doubled in severe infection

Child 7–12 years (22–40 kg) 5 mL twice daily, doubled in severe infections

5.1.1.4 Antipseudomonal penicillins

The carboxypenicillin, **ticarcillin**, is principally indicated for serious infections caused by *Pseudomonas aeruginosa* although it also has activity against certain other Gram-negative bacilli including *Proteus* spp. and *Bacteroides fragilis*.

Ticarcillin is now available only in combination with clavulanic acid (section 5.1.1.3); the combination (*Timentin*®) is active against beta-lactamase-producing bacteria resistant to ticarcillin.

Tazocin® contains the ureidopenicillin **piperacillin** with the beta-lactamase inhibitor tazobactam. Piperacillin is more active than ticarcillin against *Ps. aeruginosa*. The spectrum of activity of *Tazocin*® and *Timentin*® is comparable to that of the carbapenems, imipenem and meropenem (section 5.1.2).

These antipseudomonal penicillins may be used for the empirical treatment of septicaemia in immunocompromised children but otherwise should generally be reserved for serious infections resistant to other antibacterials. For pseudomonas septicaemias (especially in neutropenia or endocarditis) these antipseudomonal penicillins should be given with an aminoglycoside (e.g. gentamicin or netilmicin, section 5.1.4) since they have a synergistic effect.

Tazocin® is used in cystic fibrosis for the treatment of *Ps. aeruginosa* colonisation when ciprofloxacin and nebulised colistin have been ineffective, or in infective exacerbations, when it is combined with an aminoglycoside.

Owing to the sodium content of many of these antibiotics, high doses may lead to hypernatraemia.

PIPERACILLIN

Cautions see under Benzylpenicillin (section 5.1.1.1)

Contra-indications see under Benzylpenicillin (section 5.1.1.1)

Renal impairment reduce dose if estimated glomerular filtration rate less than 40 mL/minute/1.73 m² (child under 12 years) or if estimated glomerular filtration rate less than 80 mL/minute/1.73 m² (child 12–18 years); consult product literature

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding present in milk—manufacturer advises use only if potential benefit outweighs risk

Side-effects see under Benzylpenicillin (section 5.1.1.1); also nausea, vomiting, diarrhoea; *less commonly* stomatitis, dyspepsia, constipation, jaundice, hypotension, headache, insomnia, and injection-site reactions; *rarely* abdominal pain, hepatitis, oedema, fatigue and eosinophilia; *very rarely* hypoglycaemia, hypokalaemia, pancytopenia, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Licensed use *Tazocin*® not licensed for use in children under 12 years (except for children with neutropenia and complicated appendicitis)

Indication and dose

See preparations

▲ With tazobactam

Tazocin® (Lederle) (Pm)

Injection 2.25 g, powder for reconstitution, piperacillin 2 g (as sodium salt), tazobactam 250 mg (as sodium salt). Net price per vial = £7.96

Electrolytes Na⁺ 5.58 mmol/2.25-g vial

Injection 4.5 g, powder for reconstitution, piperacillin 4 g (as sodium salt), tazobactam 500 mg (as sodium salt). Net price per vial = £15.79

Electrolytes Na⁺ 11.16 mmol/4.5-g vial

Dose

(Expressed as a combination of piperacillin and tazobactam combined)

Lower respiratory tract, urinary tract, intra-abdominal and skin infections, and bacterial septicaemia

- By intravenous injection over 3–5 minutes or by intravenous infusion

Neonate 90 mg/kg every 8 hours

Child 1 month–12 years 90 mg/kg every 6–8 hours; (max 4.5 g every 6 hours)

Child 12–18 years 2.25–4.5 g every 6–8 hours, usually 4.5 g every 8 hours

Infections in children with neutropenia in combination with an aminoglycoside

- By intravenous injection over 3–5 minutes or by intravenous infusion

Child 1 month–18 years 90 mg/kg every 6 hours; (max 4.5 g every 6 hours)

Complicated appendicitis

- By intravenous injection over 3–5 minutes or by intravenous infusion

Child 2–12 years 112.5 mg/kg every 8 hours (max 4.5 g every 8 hours) for 5–14 days

Administration for intravenous infusion, dilute reconstituted solution to a concentration of 15–90 mg/mL with Glucose 5%, Sodium Chloride 0.9% or Compound Sodium Lactate, or to a concentration of 90 mg/mL with Water for Injections; give over 20–30 minutes

Important Generic preparations of piperacillin with tazobactam may have different compatibilities to *Tazocin*®—consult product literature

TICARCILLIN

Cautions see under Benzylpenicillin (section 5.1.1.1)

Hepatic impairment cholestatic jaundice, see under Co-amoxiclav

Renal impairment reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m²

Pregnancy not known to be harmful

Breast-feeding trace amounts present in breast milk—not known to be harmful but be alert for hypersensitivity in the infant

Contra-indications see under Benzylpenicillin (section 5.1.1.1)

Side-effects see under Benzylpenicillin (section 5.1.1.1); also nausea, vomiting, coagulation disorders, haemorrhagic cystitis (more frequent in children), injection-site reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, hypokalaemia, eosinophilia

Indication and dose

See under preparation

▲ **With clavulanic acid**

Note For a CSM warning on cholestatic jaundice possibly associated with clavulanic acid, see under Co-amoxiclav

Timentin® (GSK) (POM)

Injection 3.2 g, powder for reconstitution, ticarcillin 3 g (as sodium salt), clavulanic acid 200 mg (as potassium salt). Net price per vial = £5.66

Electrolytes Na⁺ 16 mmol, K⁺ 1 mmol/3.2-g vial

Dose

(Expressed as a combination of ticarcillin and clavulanic acid)

Infections due to *Pseudomonas* and *Proteus* spp. see notes above

• **By intravenous infusion**

Preterm neonate body-weight under 2 kg 80 mg/kg every 12 hours

Preterm neonate body-weight over 2 kg and neonate 80 mg/kg every 8 hours, increased to every 6 hours in more severe infections

Child 1 month–18 years and body-weight under 40 kg 80 mg/kg every 8 hours, increased to every 6 hours in more severe infections

Child under 18 years and body-weight over 40 kg 80 mg/kg (max 3.2 g) every 6–8 hours, increased to every 4 hours in more severe infections

Administration Displacement value may be important, consult local guidelines. For intermittent infusion, dilute reconstituted solution further to a concentration of 16–32 mg/mL with glucose 5% or to a concentration of 32 mg/mL with water for injections; infuse over 30–40 minutes.

5.1.1.5 **Mecillinams**

Pivmecillinam has significant activity against many Gram-negative bacteria including *Escherichia coli*, klebsiella, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci. Pivmecillinam is hydrolysed to mecillinam, which is the active drug.

PIVMECILLINAM HYDROCHLORIDE

Cautions see under Benzylpenicillin (section 5.1.1.1); also liver and renal function tests required in long-term use; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (penicillins)

Renal impairment reduce dose

Pregnancy not known to be harmful

Breast-feeding trace amounts in milk

Contra-indications see under Benzylpenicillin (section 5.1.1.1); also carnitine deficiency, oesophageal strictures, gastro-intestinal obstruction, infants under 3 months

Side-effects see under Benzylpenicillin (section 5.1.1.1); nausea, vomiting, dyspepsia; also reduced serum and total body carnitine (especially with long-term or repeated use)

Licensed use not licensed for use in children under 3 months

Indication and dose**Acute uncomplicated cystitis**

• **By mouth**

Child body-weight over 40 kg initially 400 mg then 200 mg every 8 hours for 3 days

Chronic or recurrent bacteriuria

Child body-weight over 40 kg 400 mg every 6–8 hours

Urinary-tract infections

Child body-weight under 40 kg 5–10 mg/kg every 6 hours; total daily dose may alternatively be given in 3 divided doses

Salmonellosis not recommended therefore no dose stated

Counselling Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing

Sexlid® (LEO) (POM)

Tablets, f/c, pivmecillinam hydrochloride 200 mg, net price 10-tab pack = £4.50. Label: 9, 21, 27, counselling, posture (see Dose above)

5.1.2 Cephalosporins, carbapenems, and other beta-lactams

Antibiotics in this section include the **cephalosporins**, such as cefotaxime, ceftazidime, cefuroxime, cefalexin and cefradine, the **monobactam**, aztreonam, and the **carbapenems**, imipenem (a thienamycin derivative), meropenem, and ertapenem.

5.1.2.1 Cephalosporins

The cephalosporins are broad-spectrum antibacterials which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime and ceftriaxone are suitable cephalosporins for infections of the CNS (e.g. meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of immediate hypersensitivity to penicillin should not receive a cephalosporin. If a cephalosporin is essential in these patients because a suitable alternative antibacterial is not available, then cefixime, cefotaxime, ceftazidime, ceftriaxone, or cefuroxime can be used with caution; cefaclor, cefadroxil, cefalexin, and cefradine should be avoided.

Cefradine (cephradine) has generally been replaced by the newer cephalosporins.

Cefuroxime is a 'second generation' cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria that are resistant to the other drugs and has greater activity against *Haemophilus influenzae* and *Neisseria gonorrhoeae*.

Cefotaxime, **ceftazidime** and **ceftriaxone** are 'third generation' cephalosporins with greater activity than the 'second generation' cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Ceftazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibacterial is stopped. In neonates, ceftriaxone may displace bilirubin from plasma-albumin and should be avoided in neonates with unconjugated hyperbilirubinaemia, hypoalbuminaemia, acidosis or impaired bilirubin binding.

Orally active cephalosporins The orally active 'first generation' cephalosporins, **cefalexin** (cephalexin), **cefradine**, and **cefadroxil** and the 'second generation' cephalosporin, **cefaclor**, have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, sinusitis, and skin and soft-tissue infections. Cefaclor has good activity against *H. influenzae*, but it is associated with protracted skin reactions especially in children. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*. **Cefuroxime axetil**, an ester of the 'second generation' cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.

Cefixime has a longer duration of action than the other cephalosporins that are active by mouth. It is presently only licensed for acute infections.

Cefpodoxime proxetil is more active than the other oral cephalosporins against respiratory bacterial pathogens and it is licensed for upper and lower respiratory-tract infections.

For treatment of Lyme disease, see section 5.1.1.3.

Oral infections The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in

the case of children who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin and cefradine have been used in the treatment of oral infections.

CEFACTOR

Cautions sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also notes above and p. 308); false positive urinary glucose (if tested for reducing substances) and false positive Coombs' test; **interactions:** Appendix 1 (cephalosporins)

Renal impairment no dosage adjustment required, manufacturer advises caution

Pregnancy not known to be harmful

Breast-feeding present in milk in low concentration, considered compatible with breast-feeding

Contra-indications cephalosporin hypersensitivity

Side-effects diarrhoea and rarely antibiotic-associated colitis (CSM has warned both more likely with higher doses), nausea and vomiting, abdominal discomfort, headache; allergic reactions including rashes, pruritus, urticaria, serum sickness-like reactions with rashes, fever and arthralgia, and anaphylaxis; Stevens-Johnson syndrome, toxic epidermal necrolysis reported; disturbances in liver enzymes, transient hepatitis and cholestatic jaundice; other side-effects reported include eosinophilia and blood disorders (including thrombocytopenia, leucopenia, agranulocytosis, aplastic anaemia and haemolytic anaemia); reversible interstitial nephritis, hyperactivity, nervousness, sleep disturbances, hallucinations, confusion, hypertonia, and dizziness

Indication and dose

Infections due to sensitive Gram-positive and Gram-negative bacteria but see notes above

• By mouth

Child 1 month–12 years 20 mg/kg daily in 3 divided doses, doubled for severe infection (usual max. 1 g daily)
or

Child 1 month–1 year 62.5 mg 3 times daily; dose doubled for severe infections

Child 1–5 years 125 mg 3 times daily; dose doubled for severe infections

Child 5–12 years 250 mg 3 times daily; dose doubled for severe infections

Child 12–18 years 250 mg 3 times daily; dose doubled for severe infections (max. 4 g daily)

Asymptomatic carriage of *Haemophilus influenzae* or mild exacerbations in cystic fibrosis

• By mouth

Child 1 month–1 year 125 mg every 8 hours

Child 1–7 years 250 mg 3 times daily

Child 7–18 years 500 mg 3 times daily

Cefacolor (Non-proprietary) (POM)

Capsules, cefacolor (as monohydrate) 250 mg, net price 21-cap pack = £4.52; 500 mg, 50-cap pack = £23.88. Label: 9

Brands include *Keftid*[®]

Suspension, cefacolor (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £8.33; 250 mg/5 mL, 100 mL = £9.33. Label: 9

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription
Brands include *Keftid*[®]

Distacolor[®] (Flynn) (POM)

Capsules, cefacolor (as monohydrate) 500 mg (violet/grey), net price 20 = £17.33. Label: 9

Suspension, both pink, cefacolor (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £4.13; 250 mg/5 mL, 100 mL = £8.26. Label: 9

Distacolor MR[®] (Flynn) (POM)

Tablets, m/r, both blue, cefacolor (as monohydrate) 375 mg. Net price 14-tab pack = £6.93. Label: 9, 21, 25

Dose

Susceptible infections

Child 12–18 years 375 mg every 12 hours with food, dose doubled for pneumonia

Lower urinary-tract infections

Child 12–18 years 375 mg every 12 hours with food

CEFADROXIL

Cautions see under Cefacolor

Renal impairment reduce dose if estimated glomerular filtration rate less than 26 mL/minute/1.73 m²

Pregnancy not known to be harmful

Breast-feeding present in milk in low concentrations

Contra-indications see under Cefacolor

Side-effects see under Cefacolor

Indication and dose

Infections due to sensitive Gram-positive and Gram-negative bacteria but see notes above

• By mouth

Child 1 month–1 year 12.5 mg/kg twice daily

Child 1–6 years 250 mg twice daily

Child 6–18 years

Body-weight under 40 kg 500 mg twice daily;

Body-weight over 40 kg 0.5–1 g twice daily (1 g once daily for skin, soft tissue and uncomplicated urinary-tract infections)

▢ CEFADROXIL (continued)

Cefadroxil (Non-proprietary) (POM)

Capsules, cefadroxil (as monohydrate) 500 mg, net price 20-cap pack = £5.25. Label: 9

Baxan® (Bristol-Myers Squibb) (POM)

Capsules, cefadroxil (as monohydrate) 500 mg, net price 20-cap pack = £5.64. Label: 9

CEFALEXIN

(Cephalexin)

Cautions see under Cefaclor

Renal impairment reduce dose in moderate impairment

Pregnancy not known to be harmful

Breast-feeding present in milk in low concentrations, considered compatible with breast feeding

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Indication and dose

Infections due to sensitive Gram-positive and Gram-negative bacteria but see notes above

- By mouth

Neonate under 7 days 25 mg/kg (max. 125 mg) twice daily

Neonate 7–21 days 25 mg/kg (max. 125 mg) 3 times daily

Neonate 21–28 days 25 mg/kg (max. 125 mg) 4 times daily

Child 1 month–12 years 12.5 mg/kg twice daily; dose doubled in severe infection; max. 25 mg/kg 4 times daily (max. 1 g 4 times daily) or

Child 1 month–1 year 125 mg twice daily

Child 1–5 years 125 mg 3 times daily

Child 5–12 years 250 mg 3 times daily

Child 12–18 years 500 mg 2–3 times daily, increased to 1–1.5 g 3–4 times daily for severe infection

Prophylaxis of recurrent urinary-tract infection

- By mouth

Child 1 month–18 years 12.5mg/kg at night (max. 125mg at night)

CEFIXIME

Cautions see under Cefaclor

Renal impairment reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m²

Pregnancy not known to be harmful

Breast-feeding manufacturer advises avoid—no information available

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Indication and dose

Acute infections due to sensitive Gram-positive and Gram-negative bacteria, but see notes above

- By mouth

Child 6 months–1 year 75 mg daily

Suspension, cefadroxil (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 60 mL = £1.63; 250 mg/5 mL, 60 mL = £3.24; 500 mg/5 mL, 60 mL = £4.85. Label: 9

Cefalexin (Non-proprietary) (POM)

Capsules, cefalexin 250 mg, net price 28-cap pack = £2.07; 500 mg, 21-cap pack = £2.61. Label: 9

Tablets, cefalexin 250 mg, net price 28-tab pack = £2.27; 500 mg, 21-tab pack = £2.84. Label: 9

Oral suspension, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.83; 250 mg/5 mL, 100 mL = £2.27. Label: 9

Dental prescribing on NHS Cefalexin Capsules, Tablets, and Oral Suspension may be prescribed

Ceporex® (Galen) (POM)

Capsules, both caramel/grey, cefalexin 250 mg, net price 28-cap pack = £4.02; 500 mg, 28-cap pack = £7.85. Label: 9

Tablets, all pink, f/c, cefalexin 250 mg, net price 28-tab pack = £4.02; 500 mg, 28-tab pack = £7.85. Label: 9

Syrup, all orange, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.43; 250 mg/5 mL, 100 mL = £2.87; 500 mg/5 mL, 100 mL = £5.57. Label: 9

Keflex® (Flynn) (POM)

Capsules, cefalexin 250 mg (green/white), net price 28-cap pack = £1.76; 500 mg (pale green/dark green), 21-cap pack = £2.66. Label: 9

Tablets, both peach, cefalexin 250 mg, net price 28-tab pack = £2.09; 500 mg (scored), 21-tab pack = £2.47. Label: 9

Suspension, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = 88p; 250 mg/5 mL, 100 mL = £1.51. Label: 9

Child 1–5 years 100 mg daily

Child 5–10 years 200 mg daily

Child 10–18 years 200–400 mg daily or 100–200 mg twice daily

Gonorrhoea [unlicensed indication, see also Table 1, section 5.1]

- By mouth

Child 12–18 years 400 mg as a single dose

▢ CEFIXIME (continued)

Suprax® (Rhône-Poulenc Rorer) ^(POM)

Tablets, f/c, scored, cefixime 200 mg. Net price 7-tab pack = £13.23. Label: 9

Paediatric oral suspension, cefixime 100 mg/5 mL when reconstituted with water, net price 50 mL

(with double-ended spoon for measuring 3.75 mL or 5 mL since dilution not recommended) = £10.53, 100 mL = £18.91. Label: 9

CEFOTAXIME

Cautions see under Cefaclor

Renal impairment usual initial dose, then use half normal dose if estimated glomerular filtration rate less than 5 mL/minute/1.73 m²

Pregnancy not known to be harmful

Breast-feeding present in milk in low concentration, considered compatible with breast-feeding

Contra-indications see under Cefaclor

Side-effects see under Cefaclor; rarely arrhythmias following rapid injection reported

Indication and dose

Infections due to sensitive Gram-positive and Gram-negative bacteria, surgical prophylaxis, Haemophilus epiglottitis and meningitis (Table 1, section 5.1) see also notes above

- By intramuscular or by intravenous injection or intravenous infusion

Neonate under 7 days 25 mg/kg every 12 hours; dose doubled in severe infection and meningitis

Neonate 7–21 days 25 mg/kg every 8 hours; dose doubled in severe infection and meningitis

Neonate 21–28 days 25 mg/kg every 6–8 hours; dose doubled in severe infection and meningitis

Child 1 month–18 years 50 mg/kg every 8–12 hours; increase to every 6 hours in very severe infections and meningitis (max. 12 g daily)

Important. If bacterial meningitis and especially if meningococcal disease is suspected the patient

should be transferred urgently to hospital. If benzylpenicillin cannot be given (e.g. because of an allergy), a single dose of cefotaxime may be given (if available) before urgent transfer to hospital. Suitable doses of cefotaxime by intravenous injection (or by intramuscular injection) are **Child under 12 years** 50 mg/kg; **Child over 12 years** 1 g; chloramphenicol (section 5.1.7) may be used if there is a history of anaphylaxis to penicillins or cephalosporins

Gonorrhoea

- By intramuscular or by intravenous injection or intravenous infusion

Child 12–18 years 500 mg as a single dose

Severe exacerbations of Haemophilus influenzae infection in cystic fibrosis

- By intravenous injection or intravenous infusion

Child 1 month–18 years 50 mg/kg every 6–8 hours (max. 12 g daily)

Administration Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute in glucose 5% or sodium chloride 0.9% or compound sodium lactate or water for injections; administer over 20–60 minutes; incompatible with alkaline solutions

Cefotaxime (Non-proprietary) ^(POM)

Injection, powder for reconstitution, cefotaxime (as sodium salt), net price 500-mg vial = £2.14; 1-g vial = £4.31; 2-g vial = £8.57

CEFPODOXIME

Cautions see under Cefaclor

Renal impairment increase dose interval to every 24 hours if estimated glomerular filtration rate 10–40 mL/minute/1.73 m². Increase dose interval to every 48 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Pregnancy not known to be harmful

Breast-feeding present in milk in low concentration

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Indication and dose

Upper respiratory-tract infections (but in pharyngitis and tonsillitis reserved for infections which are recurrent, chronic, or resistant to other antibacterials), lower respiratory-tract infections (including bronchitis and pneumonia), skin and soft tissue infections, uncomplicated urinary-tract infections

- By mouth

Child 15 days–6 months 4 mg/kg twice daily

Child 6 months–2 years 40 mg twice daily

Child 3–8 years 80 mg twice daily

Child 9–12 years 100 mg twice daily

Child 12–18 years 100 mg twice daily (increased to 200 mg twice daily in sinusitis, skin and soft tissue infections, uncomplicated upper urinary tract infections and if necessary in lower respiratory tract infections)

▮ **CEFPODOXIME** (*continued*)

Uncomplicated gonorrhoea

- By mouth

Child 12–18 years 200 mg as a single dose

Orelox[®] (Hoechst Marion Roussel) (POM)

Tablets, f/c, cefpodoxime 100 mg (as proxitil), net price 10-tab pack = £10.18. Label: 5, 9, 21

Oral suspension, cefpodoxime (as proxitil) for reconstitution with water, 40 mg/5 mL, net price 100 mL = £11.97. Label: 5, 9, 21

Excipients include aspartame (section 9.4.1)

CEFRADINE

(Cephadrine)

Cautions see under Cefaclor

Renal impairment reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m²

Pregnancy not known to be harmful

Breast-feeding present in milk in low concentrations

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Licensed use not licensed for use in children for prophylaxis in urinary-tract infections or for prevention of *Staphylococcus aureus* lung infection in cystic fibrosis

Indication and dose

Infections due to sensitive Gram-positive and Gram-negative bacteria but see notes above

- By mouth

Child 1 month–12 years 12.5–25 mg/kg twice daily (total daily dose may alternatively be given in 3–4 divided doses)

Child 12–18 years 0.5–1 g twice daily or 250–500 mg 4 times daily; up to 1 g 4 times daily in severe infections

- By deep intramuscular injection or by intravenous injection over 3–5 minutes or by intravenous infusion

Child 1 month–12 years 12.5–25 mg/kg every 6 hours

Child 12–18 years 0.5–1 g every 6 hours, increased to 2 g every 6 hours in severe infection

Surgical prophylaxis

- By deep intramuscular injection or by intravenous injection over 3–5 minutes

Child 12–18 years 1–2 g at induction

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis

- By mouth

Child 1 month–1 year 500 mg twice daily

Child 1–7 years 1 g twice daily

Child 7–18 years 2 g twice daily

Prophylaxis in urinary-tract infection

- By mouth

Child 1 month–12 years 3 mg/kg at night.

Administration Displacement value may be significant when reconstituting injections, consult local guidelines. For continuous or intermittent intravenous infusion dilute reconstituted solution further in Glucose 5% or Glucose 10% or Sodium chloride 0.9% or Ringer's solution or Compound sodium lactate

Cefradine (Non-proprietary) (POM)

Capsules, cefradine 250 mg, net price 20-cap pack = £3.97; 500 mg, 20-cap pack = £6.49. Label: 9

Brands include *Nicef*[®]

Dental prescribing on NHS Cefradine Capsules may be prescribed

Velosef[®] (Squibb) (POM)

Capsules, cefradine 250 mg (orange/blue), net price 20-cap pack = £5.42; 500 mg (blue), 20-cap pack = £11.22. Label: 9

Syrup, cefradine 250 mg/5 mL when reconstituted with water. Net price 100 mL = £4.22. Label: 9

Dental prescribing on NHS *Velosef*[®] syrup may be prescribed as Cefradine Oral Solution

Injection, powder for reconstitution, cefradine. Net price 500-mg vial = 99p; 1-g vial = £1.95

CEFTAZIDIME

Cautions see under Cefaclor

Renal impairment reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²

Pregnancy not known to be harmful

Breast-feeding present in milk in low concentration, considered compatible with breast-feeding

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Licensed use nebulised route unlicensed

Indication and dose

Infections due to sensitive Gram-positive and Gram-negative bacteria but see notes above

- By intravenous injection or infusion

Neonate under 7 days 25 mg/kg every 24 hours; dose doubled in severe infection and meningitis

Neonate 7–21 days 25 mg/kg every 12 hours; dose doubled in severe infection and meningitis

Neonate 21–28 days 25 mg/kg every 8 hours; dose doubled in severe infection and meningitis

Child 1 month–18 years 25 mg/kg every 8 hours; dose doubled in severe infection, febrile neutropenia and meningitis (max. 6 g daily)

▮ CEFTAZIDIME (continued)

Pseudomonas lung infection in cystic fibrosis

- By intravenous injection or infusion or by deep intramuscular injection

Child 1 month–18 years 50 mg/kg every 8 hours (max. 9 g daily)

Chronic *Burkholderia cepacia* infection in cystic fibrosis

- By inhalation of nebulised solution

Child 1 month–18 years 1 g twice daily

Administration For parenteral administration, intravenous route recommended in children. Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute reconstituted solution further to a concentration of not more than 40 mg/mL in Glucose 5% or Glucose 10% or Sodium chloride 0.9% or Compound sodium lactate.

For nebulisation, dissolve dose in 3 mL of water for injection

Ceftazidime (Non-proprietary) ^(POM)

Injection, powder for reconstitution, ceftazidime (as pentahydrate), with sodium carbonate, net price 1-g vial = £8.50; 2-g vial = £17.90

Fortum® (GSK) ^(POM)

Injection, powder for reconstitution, ceftazidime (as pentahydrate), with sodium carbonate, net price 500-mg vial = £4.40, 1-g vial = £8.79, 2-g vial = £17.59, 3-g vial = £25.76
Electrolytes Na⁺ 2.3 mmol/g

Kefadim® (Flynn) ^(POM)

Injection, powder for reconstitution, ceftazidime (as pentahydrate), with sodium carbonate, net price 1-g vial = £7.92; 2-g vial = £15.84
Electrolytes Na⁺ 2.3 mmol/g

CEFTRIAZONE

Cautions see under Cefaclor; preterm neonates; may displace bilirubin from serum albumin, administer over 60 minutes in neonates (see also Contra-indications); treatment longer than 14 days, renal failure, dehydration—risk of ceftriaxone precipitation in gall bladder

Hepatic impairment if hepatic impairment is accompanied by severe renal impairment, reduce dose and monitor plasma concentration

Renal impairment max. 50 mg/kg daily (max. 2 g daily) in severe renal impairment; also monitor plasma concentration if hepatic impairment accompanied by severe renal impairment

Pregnancy not known to be harmful

Breast-feeding present in milk in low concentration, considered compatible with breast-feeding

Contra-indications see under Cefaclor; neonates with jaundice, hypoalbuminaemia, acidosis or impaired bilirubin binding; concomitant treatment with calcium—risk of precipitation in urine and lungs of neonates (and possibly infants and older children)

Side-effects see under Cefaclor; calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised) or in gall bladder—consider discontinuation if symptomatic; rarely prolongation of prothrombin time, pancreatitis

Indication and dose

Infections due to sensitive Gram-positive and Gram-negative bacteria

- By intravenous infusion over 60 minutes

Neonate 20–50 mg/kg once daily

- By deep intramuscular injection, or by intravenous injection over 2–4 minutes, or by intravenous infusion

Child 1 month–12 years

Body-weight under 50 kg 50 mg/kg once daily; up to 80 mg/kg daily in severe infections and meningitis; doses of 50 mg/kg and over by intravenous infusion only

Body-weight 50 kg and over dose as for child 12–18 years

Child 12–18 years 1 g daily; 2–4 g daily in severe infections and meningitis; intramuscular doses over 1 g divided between more than one site; single intravenous doses above 1 g by intravenous infusion only

Uncomplicated gonorrhoea

- By deep intramuscular injection

Child 12–18 years 250 mg as a single dose

Early syphilis [unlicensed indication]

- By deep intramuscular injection

Child 12–18 years 500 mg daily for 10 days

Surgical prophylaxis

- By deep intramuscular injection or by intravenous injection over at least 2–4 minutes, or (for colorectal surgery) by intravenous infusion

Child 12–18 years 1 g at induction; colorectal surgery, 2 g at induction; intramuscular doses over 1 g divided between more than one site

Prophylaxis of meningococcal meningitis Table 2, section 5.1

Administration Displacement value may be significant, consult local guidelines. For *intravenous infusion*, dilute reconstituted solution with Glucose 5% or 10% or Sodium Chloride 0.9%; give over at least 30 minutes (60 minutes in neonates). Not to be given with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines.

For *intramuscular injection* ceftriaxone may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site; final concentration 250–350 mg/mL.

▢ CEFTRIAXONE (continued)

Ceftriaxone (Non-proprietary) (PAM)

Injection, powder for reconstitution, ceftriaxone (as sodium salt), net price 1-g vial = £10.17; 2-g vial = £20.36

Rocephin® (Roche) (PAM)

Injection, powder for reconstitution, ceftriaxone (as sodium salt), net price 250-mg vial = £2.55; 1-g vial = £10.17; 2-g vial = £20.36
Electrolytes Na⁺ 3.6 mmol/g

CEFUROXIME

Cautions see under Cefaclor

Renal impairment reduce parenteral dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m²

Pregnancy not known to be harmful

Breast-feeding present in milk in low concentration

Contra-indications see under Cefaclor

Side-effects see under Cefaclor

Indication and dose

Infections due to sensitive Gram-positive and Gram-negative bacteria

- **By mouth (as cefuroxime axetil),**

Child 3 months–2 years 10 mg/kg (max. 125 mg) twice daily

Child 2–12 years 15 mg/kg (max. 250 mg) twice daily

Child 12–18 years 250 mg twice daily; dose doubled in severe lower respiratory-tract infections, or if pneumonia suspected; dose reduced to 125 mg twice daily in lower urinary-tract infection

- **Intravenous injection or infusion or by intramuscular injection**

Neonate under 7 days 25 mg/kg every 12 hours; dose doubled in severe infection, intravenous route only

Neonate 7–21 days 25 mg/kg every 8 hours; dose doubled in severe infection, intravenous route only

Neonate 21–28 days 25 mg/kg every 6 hours; dose doubled in severe infection, intravenous route only

Child 1 month–18 years 20 mg/kg (max. 750 mg) every 8 hours; increase to 50–60 mg/kg (max. 1.5 g) every 6–8 hours in severe infection and cystic fibrosis

Lyme disease

- **By mouth**

Child 12–18 years 500 mg twice daily for 20 days

Surgical prophylaxis

- **By intravenous injection**

Child 1 month–18 years 50 mg/kg (max. 1.5 g) at induction, up to 3 further doses of 30 mg/kg (max. 750 mg) may be given by *intramuscular or intravenous injection* every 8 hours for high-risk procedures

Administration Single doses over 750 mg should be administered by the intravenous route only. Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9% or compound sodium lactate; give over 30 minutes.

Cefuroxime (Non-proprietary) (PAM)

Tablets, cefuroxime (as axetil) 250 mg, net price 14-tab pack = £9.01. Label: 9, 21, 25

Zinacef® (GSK) (PAM)

Injection, powder for reconstitution, cefuroxime (as sodium salt). Net price 250-mg vial = 94p; 750-mg vial = £2.34; 1.5-g vial = £4.70

Electrolytes Na⁺ 1.8 mmol/750-mg vial

Zinnat® (GSK) (PAM)

Tablets, both f/c, cefuroxime (as axetil) 125 mg, net price 14-tab pack = £4.84; 250 mg, 14-tab pack = £9.67. Label: 9, 21, 25

Suspension, cefuroxime (as axetil) 125 mg/5 mL when reconstituted with water, net price 70 mL (tutti-frutti-flavoured) = £5.52. Label: 9, 21

Excipients include aspartame (section 9.4.1), sucrose 3.1 g/5 mL

5.1.2.2 Carbapenems

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; **imipenem** and **meropenem** have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against methicillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections caused by multiple-antibacterial resistant organisms (including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections).

Ertapenem is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter* spp.

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with **cilastatin**, a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics; neurotoxicity has been observed at very high dosage, in renal failure, or in patients with CNS disease. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection. Ertapenem has been associated with seizures uncommonly.

ERTAPENEM

Cautions hypersensitivity to beta-lactam antibiotics (avoid if history of immediate hypersensitivity reaction, see also p. 308); renal impairment, CNS disorders—risk of seizures; **interactions:** Appendix 1 (ertapenem)

Renal impairment avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk

Contra-indications

Breast-feeding present in milk—manufacturer advises avoid

Side-effects diarrhoea, nausea, vomiting, headache, injection-site reactions, rash, pruritus, raised platelet count; *less commonly* dry mouth, taste disturbances, dyspepsia, abdominal pain, anorexia, constipation, melaena, antibiotic-associated colitis, hypotension, chest pain, oedema, pharyngeal discomfort, dyspnoea, dizziness, sleep disturbances, confusion, asthenia, seizures, vaginitis, raised glucose, petechiae; *rarely* dysphagia, cholecystitis, liver disorder (including jaundice), arrhythmia, increase in blood pressure, syncope, nasal congestion, cough, wheezing, hypersensitivity reactions, anxiety, depression,

agitation, tremor, pelvic peritonitis, renal impairment, muscle cramp, scleral disorder, blood disorders (including neutropenia, thrombocytopenia, haemorrhage), hypoglycaemia, electrolyte disturbances; *very rarely* hallucinations

Indication and dose

Abdominal infections, acute gynaecological infections, community-acquired pneumonia

• By intravenous infusion

Child 3 months–13 years 15 mg/kg every 12 hours (max. 1 g daily)

Child 13–18 years 1 g once daily

Administration reconstitute 1 g with 10 mL Water for Injections or Sodium Chloride 0.9%; for *intermittent intravenous infusion*, dilute requisite dose in Sodium Chloride 0.9% to a final concentration not exceeding 20 mg/mL; incompatible with glucose solutions

Invanz® (MSD) POM

Intravenous infusion, powder for reconstitution, ertapenem (as sodium salt), net price 1-g vial = £31.65

Electrolytes Na⁺ 6 mmol/1-g vial

IMIPENEM WITH CILASTATIN

Cautions CNS disorders (e.g. epilepsy); hypersensitivity to beta-lactam antibiotics (avoid if history of immediate hypersensitivity reaction, see also p. 308); **interactions:** Appendix 1 (imipenem with cilastatin)

Renal impairment not licensed for use in children with renal impairment. Reduce dose if estimated glomerular filtration rate less than 70 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies)

Breast-feeding present in milk but unlikely to be absorbed (however, manufacturer advises avoid)

Side-effects nausea, vomiting, diarrhoea (antibiotic-associated colitis reported), taste disturbances, tooth or tongue discoloration, hearing loss; blood disorders, positive Coombs' test; allergic reactions (with rash, pruritus, urticaria,

Stevens-Johnson syndrome, fever, anaphylactic reactions, rarely toxic epidermal necrolysis, exfoliative dermatitis); myoclonic activity, convulsions, confusion and mental disturbances reported; slight increases in liver enzymes and bilirubin reported, rarely hepatitis; increases in serum creatinine and blood urea; red coloration of urine in children reported; local reactions: erythema, pain and induration, and thrombophlebitis

Licensed use not licensed for use in children under 3 months

◊ IMIPENEM WITH CILASTATIN (*continued*)

Indication and dose

Aerobic and anaerobic Gram-positive and Gram-negative infections, hospital-acquired septicæmia Table 1, section 5.1; not indicated for CNS infections

- **By intravenous infusion** expressed in terms of imipenem

Neonate under 7 days 20 mg/kg every 12 hours

Neonate 7–21 days 20 mg/kg every 8 hours

Neonate 21–28 days 20 mg/kg every 6 hours

Child 1–3 months 20 mg/kg every 6 hours

Child 3 months–18 years

Body-weight under 40 kg 15 mg/kg (max. 500 mg) every 6 hours

Body-weight over 40 kg 250–500 mg every 6 hours; less sensitive organisms up to 12.5 mg/kg (max. 1 g) every 6 hours; total daily dose may alternatively be given in 3 divided doses

Cystic fibrosis

- **By intravenous infusion**

Child 1 month–18 years

Body-weight under 40 kg 22.5 mg/kg every 6 hours

Body-weight over 40 kg 1 g every 6–8 hours

Administration for intermittent intravenous infusion dilute to a concentration of 5 mg (as imipenem)/mL in sodium chloride 0.9% or sodium chloride and glucose; give up to 500 mg over 20–30 minutes; give 1 g over 40–60 minutes

Primaxin® (MSD) (PoM)

Intravenous infusion, powder for reconstitution, imipenem (as monohydrate) 500 mg with cilastatin (as sodium salt) 500 mg, net price per vial = £12.00
Electrolytes Na⁺ 1.72 mmol/vial

MEROPEM

Cautions hypersensitivity to beta-lactam antibiotics (avoid if history of immediate hypersensitivity reaction, see also p. 308); **interactions:** Appendix 1 (meropenem)

Hepatic impairment monitor transaminase and bilirubin concentrations

Renal impairment use normal dose every 12 hours if estimated glomerular filtration rate 26–50 mL/minute/1.73 m²; use half normal dose every 12 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m²; use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding unlikely to be absorbed (but manufacturer advises avoid unless potential benefit outweighs risk)

Side-effects nausea, vomiting, diarrhoea (antibiotic-associated colitis reported), abdominal pain, disturbances in liver function tests; headache; thrombocythaemia, positive Coombs' test; rash, pruritus, injection-site reactions; *less commonly* eosinophilia and thrombocytopenia; *rarely* convulsions; also reported paraesthesia, leucopenia, haemolytic anaemia, reduction in partial thromboplastin time, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Licensed use not licensed for use in children for infection in neutropenia; not licensed for use in children under 3 months

Indication and dose

Aerobic and anaerobic Gram-positive and Gram-negative infections, hospital-acquired septicæmia Table 1, section 5.1

- **By intravenous injection over 5 minutes or by intravenous infusion**

Neonate under 7 days 20 mg/kg every 12 hours, dose doubled in severe infection

Neonate 7–28 days 20 mg/kg every 8 hours; dose doubled in severe infection

Child 1 month–12 years

Body-weight under 50 kg 10 mg/kg every 8 hours; dose doubled in hospital-acquired pneumonia, peritonitis, septicæmia and infections in neutropenic patients

Body-weight over 50 kg dose as for child 12–18 years

Child 12–18 years 500 mg every 8 hours; dose doubled in hospital-acquired pneumonia, peritonitis, septicæmia and infections in neutropenic patients

Meningitis

- **By intravenous injection over 5 minutes or by intravenous infusion**

Neonate under 7 days 40 mg/kg every 12 hours

Neonate 7–28 days 40 mg/kg every 8 hours

Child 1 month–12 years

Body-weight under 50 kg 40 mg/kg every 8 hours

Body-weight over 50 kg dose as for child 12–18 years

Child 12–18 years 2 g every 8 hours

Exacerbations of chronic lower respiratory-tract infections in cystic fibrosis

- **By intravenous injection over 5 minutes or by intravenous infusion**

Child 1 month–18 years 40 mg/kg every 8 hours (max. 2 g every 8 hours)

Administration Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute reconstituted solution further in glucose 5% or glucose 10% or sodium chloride 0.9% and give over 15–30 minutes

▮ MEROPENEM (continued)

Meronom[®] (AstraZeneca) (POM)

Injection, powder for reconstitution, meropenem (as trihydrate), net price 500-mg vial = £8.60; 1-g vial = £17.19

Electrolytes Na⁺ 3.9 mmol/g

5.1.2.3 Other beta-lactam antibiotics

Aztreonam is a monocyclic beta-lactam ('monobactam') antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for 'blind' treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection). Side-effects are similar to those of the other beta-lactams although aztreonam may be less likely to cause hypersensitivity in penicillin-sensitive patients.

AZTREONAM

Cautions hypersensitivity to beta-lactam antibiotics; **interactions:** Appendix 1 (aztreonam)

Hepatic impairment experience limited, monitor liver function

Renal impairment usual initial dose, then half normal dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², usual initial dose, then one-quarter normal dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Breast-feeding present in milk in low concentration, considered compatible with breast-feeding

Contra-indications aztreonam hypersensitivity

Pregnancy manufacturer advises avoid—crosses placenta and no further information available

Side-effects nausea, vomiting, diarrhoea, abdominal cramps; mouth ulcers, altered taste; jaundice and hepatitis; flushing; hypersensitivity reactions; blood disorders (including thrombocytopenia and neutropenia); rashes, injection-site reactions; *rarely* hypotension, seizures, asthenia, confusion, dizziness, headache, halitosis, and breast tenderness; *very rarely* antibiotic-associated colitis, gastro-intestinal bleeding, and toxic epidermal necrolysis

Licensed use not licensed for use in children under 7 days

Indication and dose

Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*

- **By intravenous injection over 3–5 minutes or by intravenous infusion**

Neonate under 7 days 30 mg/kg every 12 hours

Neonate 7–28 days 30 mg/kg every 6–8 hours

Child 1 month–2 years 30 mg/kg every 6–8 hours

Child 2–12 years 30 mg/kg every 6–8 hours increased to 50 mg/kg every 6–8 hours in severe infection and cystic fibrosis (max 2 g every 6 hours)

Child 12–18 years 1 g every 8 hours or 2 g every 12 hours; 2 g every 6–8 hours for severe infections (including systemic *Ps. aeruginosa* and lung infections in cystic fibrosis)

Administration Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% or Ringer's solution or Compound sodium lactate to a concentration of less than 20 mg/mL; to be given over 20–60 minutes

Azctam[®] (Squibb) (POM)

Injection, powder for reconstitution, aztreonam.

Net price 500-mg vial = £5.00; 1-g vial = £9.98; 2-g vial = £19.98

5.1.3 Tetracyclines

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. In children over 12 years of age they are useful for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline with either streptomycin or rifampicin), and the spirochaete, *Borrelia burgdorferi* (Lyme disease—see section 5.1.1.3). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic respiratory diseases (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin).

Microbiologically, there is little to choose between the various tetracyclines, the only exception being **minocycline** which has a broader spectrum; it is active

against *Neisseria meningitidis* and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo (see Table 2, section 5.1 for current recommendations). Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

For the role of tetracyclines in the management of meticillin-resistant *Staphylococcus aureus* (MRSA) infections, see p.310.

Oral infections In children over 12 years of age, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline has a longer duration of action than tetracycline or oxytetracycline and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

For the use of doxycycline in the treatment of recurrent aphthous ulceration, oral herpes, or as an adjunct to gingival scaling and root planing for periodontitis, see section 12.3.1 and section 12.3.2.

Cautions Tetracyclines should be used with caution in patients receiving potentially hepatotoxic drugs. Tetracyclines may increase muscle weakness in patients with myasthenia gravis, and exacerbate systemic lupus erythematosus. Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines; milk also reduces the absorption of demeclocycline, oxytetracycline, and tetracycline. Other **interactions**: Appendix 1 (tetracyclines).

Hepatic impairment: avoid (or use with caution); tetracycline and demeclocycline max. 1 g daily in divided doses.

Renal impairment: with the exception of doxycycline and minocycline, the tetracyclines may exacerbate renal failure and should not be given to patients with mild, moderate, or severe renal impairment. Doxycycline or minocycline may be used cautiously (avoid excessive doses).

Pregnancy: avoid in pregnancy. In the first trimester, effects on skeletal development in *animal* studies. In the second and third trimester, dental discolouration.

Breast-feeding: avoid (although absorption and therefore discolouration of teeth in infant probably usually prevented by chelation with calcium in milk)

Contra-indications Deposition of tetracyclines in growing bone and teeth (by binding to calcium) causes staining and occasionally dental hypoplasia, and they should **not** be given to children under 12 years, or to pregnant or breast-feeding women. However, doxycycline may be used in children for treatment and post-exposure prophylaxis of anthrax when an alternative antibacterial cannot be given [unlicensed indication]. Tetracyclines should not be given to children with acute porphyria (section 9.8.2).

Side-effects Side-effects of the tetracyclines include nausea, vomiting, diarrhoea (antibiotic-associated colitis reported occasionally), dysphagia, and oesophageal irritation. Other rare side-effects include hepatotoxicity, pancreatitis, blood disorders, photosensitivity (particularly with demeclocycline), and hypersensitivity reactions (including rash, exfoliative dermatitis, Stevens-Johnson syndrome, urticaria, angioedema, anaphylaxis, pericarditis). Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment); bulging fontanelles have been reported in infants.

TETRACYCLINE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also reported, pancreatitis, acute renal failure, skin discoloration

Indication and dose

Susceptible infections see notes above

• By mouth

Child 12–18 years 250 mg 4 times daily, increased in severe infections to 500 mg 3–4 times daily

Acne section 13.6.2

□ TETRACYCLINE (continued)

Non-gonococcal urethritis

- By mouth

Child 12–18 years 500 mg 4 times daily for 7–14 days (21 days if failure or relapse after first course)

Tetracycline (Non-proprietary) ^(POM)

Tablets, coated, tetracycline hydrochloride 250 mg, net price 28-tab pack = £8.85. Label: 7, 9, 23, counselling, posture

Dental prescribing on NHS Tetracycline Tablets may be prescribed

DEMECLOCYCLINE HYDROCHLORIDE

Cautions see notes above, but photosensitivity more common (avoid exposure to sunlight or sun lamps)

Contra-indications see notes above

Side-effects see notes above; also reversible nephrogenic diabetes insipidus, acute renal failure

Indication and dose

Susceptible infections see notes above

- By mouth

Child 12–18 years 150 mg 4 times daily or 300 mg twice daily

Ledermycin® (Goldshield) ^(POM)

Capsules, red, demeclocycline hydrochloride 150 mg, net price 28-cap pack = £13.73. Label: 7, 9, 11, 23

DOXYCYCLINE

Cautions see notes above, but may be used in renal impairment; alcohol dependence; photosensitivity reported (avoid exposure to sunlight or sun lamps)

Contra-indications see notes above

Side-effects see notes above; also anorexia, flushing, tinnitus

Licensed use not licensed for use in children under 12 years

Indication and dose

Susceptible infections see notes above

- By mouth

Child 12–18 years 200 mg on first day, then 100 mg daily; severe infections (including refractory urinary-tract infections) 200 mg daily

Early syphilis

- By mouth

Child 12–18 years 100 mg twice daily for 14 days

Late latent syphilis

- By mouth

Child 12–18 years 100 mg twice daily for 28 days

Uncomplicated genital chlamydia, non-gonococcal urethritis, pelvic inflammatory disease Table 1, section 5.1

- By mouth

Child 12–18 years 100 mg twice daily for 7 days (14 days in pelvic inflammatory disease)

Anthrax (treatment or post-exposure prophylaxis) see also section 5.1.12

- By mouth

Child under 12 years (only if alternative antibacterial cannot be given) 2.5 mg/kg twice daily (max. 100 mg twice daily)

Child 12–18 years 100 mg twice daily

Acne section 13.6.2

Adjunct to gingival scaling and root planing for periodontitis section 12.3.1

Counselling Capsules should be swallowed whole with plenty of fluid during meals while sitting or standing

Note Doxycycline doses in BNF for Children may differ from those in product literature

Doxycycline (Non-proprietary) ^(POM)

Capsules, doxycycline (as hyclate) 50 mg, net price 28-cap pack = £1.78; 100 mg, 8-cap pack = £1.15. Label: 6, 9, 11, 27, counselling, posture

Brands include *Doxylar*®

Dental prescribing on NHS Doxycycline Capsules 100 mg may be prescribed

Vibramycin-D® (Pfizer) ^(POM)

Dispersible tablets, yellow, scored, doxycycline 100 mg, net price 8-tab pack = £4.91. Label: 6, 9, 11, 13

LYMECYCLINE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Indication and dose

Susceptible infections see notes above

- By mouth

Child 12–18 years 408 mg twice daily, increased to 1.224–1.632 g daily in severe infections

◻ LYMECYCLINE (continued)

Acne

- By mouth

Child 12–18 years 408 mg daily for at least 8 weeks

MINOCYCLINE

Cautions see notes above, but may be used in renal impairment; if treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens

Contra-indications see notes above

Side-effects see notes above; also dizziness and vertigo (more common in women); *rarely* anorexia, tinnitus, impaired hearing, hyperaesthesia, paraesthesia, acute renal failure, pigmentation (sometimes irreversible), and alopecia; *very rarely* systemic lupus erythematosus, discoloration of conjunctiva, tears, and sweat

Indication and dose

Susceptible infections see notes above

- By mouth

Child 12–18 years 100 mg twice daily

Acne section 13.6.2

Counselling Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing

Minocycline (Non-proprietary) ^(POM)

Capsules, minocycline (as hydrochloride) 50 mg, net price 56-cap pack = £15.27; 100 mg, 28-cap pack = £13.09. Label: 6, 9, counselling, posture
Brands include *Aknemin*[®]

Tablets, minocycline (as hydrochloride) 50 mg, net price 28-tab pack = £3.96; 100 mg, 28-tab pack = £8.43. Label: 6, 9, counselling, posture

OXYTETRACYCLINE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Indication and dose

Susceptible infections see notes above

- By mouth

Child 12–18 years 250–500 mg 4 times daily

Acne section 13.6.2

Tetralysal 300[®] (Galderma) ^(POM)

Capsules, red/yellow, lymecycline 408 mg (= tetracycline 300 mg). Net price 28-cap pack = £7.16, 56-cap pack = £14.26. Label: 6, 9

▲ Modified release

Ancamino[®] MR (Dexcel) ^(POM)

Capsules, m/r, buff/brown (enclosing pink and peach tablets), minocycline (as hydrochloride) 100 mg, net price 56-cap pack = £21.14. Label: 6, 25

Dose

Acne

- By mouth

Child 12–18 years 1 capsule daily

Minocin MR[®] (Meda) ^(POM)

Capsules, m/r, orange/brown (enclosing yellow and white pellets), minocycline (as hydrochloride) 100 mg. Net price 56-cap pack = £21.14. Label: 6, 25

Dose

Acne

Oxytetracycline (Non-proprietary) ^(POM)

Tablets, coated, oxytetracycline dihydrate 250 mg, net price 28-tab pack = £1.00. Label: 7, 9, 23
Brands include *Oxymycin*[®]

Dental prescribing on NHS Oxytetracycline Tablets may be prescribed

5.1.4 Aminoglycosides

These include amikacin, gentamicin, neomycin, streptomycin, and tobramycin. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis (section 5.1.9).

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Excretion is principally via the kidney and accumulation occurs in renal impairment.

Most side-effects of this group of antibiotics are dose-related therefore care must be taken with dosage and whenever possible treatment should not exceed 7 days. The important side-effects are ototoxicity, and nephrotoxicity; they occur most commonly in children with renal failure.

If there is impairment of renal function (or high pre-dose serum concentrations) the interval between doses must be increased; if the renal impairment is severe the dose itself should be reduced as well.

Aminoglycosides may impair neuromuscular transmission and should not be given to children with myasthenia gravis; large doses given during surgery have been responsible for a transient myasthenic syndrome in patients with normal neuromuscular function.

Aminoglycosides should preferably not be given with potentially ototoxic diuretics (e.g. furosemide (frusemide)); if concurrent use is unavoidable administration of the aminoglycoside and of the diuretic should be separated by as long a period as practicable.

Once daily dosage *Once daily administration* of aminoglycosides is more convenient, provides adequate serum concentrations, and has largely superseded *multiple-daily dose regimens* (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in children with endocarditis or extensive burns of more than 20% of the total body surface area, or in children over 1 month of age with a creatinine clearance of less than 20 mL/minute/1.73m². The *extended interval dose regimen* is used in neonates to reflect the changes in renal function that occur with increasing gestational and postnatal age (see Neonates below).

Serum concentrations Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. In children with normal renal function, aminoglycoside concentration should be measured initially after 3 or 4 doses for multiple daily dose regimens; children with renal impairment may require earlier and more frequent measurement of aminoglycoside concentration.

Blood samples should be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration, not necessary for once daily dosing in children over 1 month) and also just before the next dose ('trough' concentration).

Serum-aminoglycoside concentration should be measured in all children and **must** be determined in infants, in neonates, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

Cystic fibrosis A higher dose of parenteral aminoglycoside is often required in children with cystic fibrosis because renal clearance of the aminoglycoside is increased. For the role of aminoglycosides in the treatment of pseudomonas lung infections in cystic fibrosis see Table 1, section 5.1. Nebulised tobramycin is used for chronic pseudomonas lung infection in cystic fibrosis; however, resistance may develop, and some children do not respond to treatment. Gentamicin can be used similarly [unlicensed use].

Endocarditis **Gentamicin** is used in combination with other antibiotics for the treatment of bacterial endocarditis (Table 1, section 5.1). Serum-gentamicin concentration should be determined twice each week (more often in renal impairment). **Streptomycin** may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the 'blind' therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis (see above and Table 1, section 5.1).

Loading and maintenance doses may be calculated on the basis of the patient's weight and renal function (e.g. using a nomogram); adjustments are then made

according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, children with cystic fibrosis or the immunocompromised patient; whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria. Tobramycin may be administered by nebuliser for the treatment of *Ps. aeruginosa* infection in cystic fibrosis (see Cystic Fibrosis, above).

Neomycin is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin may be absorbed from the gut in children with hepatic failure and, as these children may also be uraemic, cumulation may occur with resultant ototoxicity.

Neonates As aminoglycosides are eliminated principally via the kidney, neonatal treatment must reflect the changes in glomerular filtration that occur with increasing gestational and postnatal age. In patients on single daily dose regimens it may become necessary to prolong the dose interval to more than 24 hours if the trough concentration is high.

GENTAMICIN

Cautions neonates, infants (adjust dose and monitor renal, auditory and vestibular function together with serum gentamicin concentrations); avoid prolonged use; conditions characterised by muscular weakness; obesity (use ideal weight for height to calculate dose and monitor serum-gentamicin concentration closely); see also notes above; **interactions:** Appendix 1 (aminoglycosides)

Renal impairment reduce dose frequency; monitor renal, auditory, and vestibular function; monitor serum-gentamicin concentrations; see notes above

Pregnancy *second, third trimesters:* auditory or vestibular nerve damage; risk greatest with streptomycin; probably very small with gentamicin and tobramycin, but avoid unless essential (if given, serum-aminoglycoside concentration monitoring essential)

Contra-indications myasthenia gravis

Side-effects vestibular and auditory damage, nephrotoxicity; rarely, hypomagnesaemia on prolonged therapy, antibiotic-associated colitis; also reported, nausea, vomiting, rash, blood disorders; see also notes above

Licensed use not licensed for nebulisation

Pharmacokinetics *Extended interval dose regimen in neonates:* pre-dose ('trough') concentration should be less than 2 mg/litre

Once daily dose regimen: pre-dose ('trough') concentration should be less than 1 mg/litre

Multiple daily dose regimen: one hour ('peak') serum concentration should be 5–10 mg/litre (3–5 mg/litre for endocarditis, 8–12 mg/litre in cystic fibrosis); pre-dose ('trough') concentration should be less than 2 mg/litre (less than 1 mg/litre for endocarditis)

Intrathecal/intraventricular injection: cerebrospinal fluid concentration should not exceed 10 mg/litre

Indication and dose

Neonatal sepsis

- Extended interval dose regimen by slow intravenous injection or intravenous infusion

Neonate less than 32 weeks postmenstrual age
4–5 mg/kg every 36 hours

Neonate 32 weeks and over postmenstrual age
4–5 mg/kg every 24 hours

- Multiple daily dose regimen by slow intravenous injection

Neonate less than 29 weeks postmenstrual age
2.5 mg/kg every 24 hours

Neonate 29–35 weeks postmenstrual age
2.5 mg/kg every 18 hours

Neonate over 35 weeks postmenstrual age
2.5 mg/kg every 12 hours

Septicaemia, meningitis and other CNS infections, biliary-tract infection, acute pyelonephritis, endocarditis (see notes above), pneumonia in hospital patients, adjunct in listerial meningitis (Table 1, section 5.1)

- Once daily dose regimen (not for endocarditis or meningitis) by intravenous infusion

Child 1 month–18 years initially 7 mg/kg, then adjusted according to serum-gentamicin concentration

- Multiple daily dose regimen by intramuscular or by slow intravenous injection over at least 3 minutes

Child 1 month–12 years 2.5 mg/kg every 8 hours

Child 12–18 years 2 mg/kg every 8 hours

□ GENTAMICIN (continued)

Pseudomonas lung infection in cystic fibrosis

- By slow intravenous injection over at least 3 minutes or by intravenous infusion
 - Child 1 month–18 years 3 mg/kg every 8 hours
- By inhalation of nebulised solution
 - Child 1 month–2 years 40 mg twice daily
 - Child 2–8 years 80 mg twice daily
 - Child 8–18 years 160 mg twice daily

Bacterial ventriculitis and CNS infection (supplement to systemic therapy)

- By intrathecal or intraventricular injection, seek specialist advice

Neonate seek specialist advice

Child 1 month–18 years 1 mg daily (increased if necessary to 5 mg daily)

Note only preservative-free, intrathecal preparation should be used

Eye section 11.3.1

Ear section 12.1.1

Note Local guidelines may vary. See Pharmacokinetics above for serum-concentration monitoring. In obese or severely oedematous children use ideal weight for height to calculate the dose

Administration for intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes

For nebulisation, dilute preservative-free preparation in 3 mL sodium chloride 0.9%. Administer after physiotherapy and bronchodilators. For intrathecal or intraventricular injection, use preservative-free intrathecal preparations only

Gentamicin (Non-proprietary) ^(POM)

Injection, gentamicin (as sulphate), net price 40 mg/mL, 1-mL amp = £1.40, 2-mL amp = £1.54, 2-mL vial = £1.48

Paediatric injection, gentamicin (as sulphate) 10 mg/mL, net price 2-mL vial = £1.80

Intrathecal injection, gentamicin (as sulphate) 5 mg/mL, net price 1-mL amp = 74p

Cidomycin® (Sanofi-Aventis) ^(POM)

Injection, gentamicin (as sulphate) 40 mg/mL. Net price 2-mL amp or vial = £1.48

Genticin® (Amdipharm) ^(POM)

Injection, gentamicin (as sulphate) 40 mg/mL. Net price 2-mL amp = £1.40

Isonic Gentamicin Injection (Baxter) ^(POM)

Intravenous infusion, gentamicin (as sulphate) 800 micrograms/mL in sodium chloride intravenous infusion 0.9%. Net price 100-mL (80-mg) *Viaflex*® bag = £1.61

Electrolytes Na⁺ 15.4 mmol/100-mL bag

AMIKACIN

Cautions see under Gentamicin

Contra-indications see under Gentamicin

Side-effects see under Gentamicin

Pharmacokinetics *Multiple dose regimen*: one-hour ('peak') serum concentration should not exceed 30 mg/litre; pre-dose ('trough') concentration should be less than 10 mg/litre

Once daily dose regimen: pre-dose ('trough') concentration should be less than 5 mg/litre

Licensed use dose for cystic fibrosis not licensed

Indication and dose

Neonatal sepsis

- Extended interval dose regimen by slow intravenous injection over 3–5 minutes or by intravenous infusion

Neonate 15 mg/kg every 24 hours

- Multiple daily dose regimen by intramuscular or by slow intravenous injection or by infusion

Neonate loading dose of 10 mg/kg then 7.5 mg/kg every 12 hours

Serious Gram-negative infections resistant to gentamicin

- By slow intravenous injection over 3–5 minutes
 - Child 1 month–12 years 7.5 mg/kg every 12 hours

Child 12–18 years 7.5 mg/kg every 12 hours, increased to 7.5 mg/kg every 8 hours in severe infections, max. 500 mg every 8 hours for up to 10 days (max. cumulative dose 15 g)

Once daily dose regimen (not for endocarditis or meningitis)

- By intravenous injection or infusion

Child 1 month–18 years initially 15 mg/kg, then adjusted according to serum-amikacin concentration

Pseudomonas lung infection in cystic fibrosis

- Multiple daily dose regimen by slow intravenous injection or infusion

Child 1 month–18 years 10 mg/kg every 8 hours (max. 500 mg every 8 hours)

Note Local dosage guidelines may vary. For monitoring guidelines see Pharmacokinetics above. In obese or severely oedematous children use ideal weight for height to calculate the dose

Administration for intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9% or Compound Sodium Lactate; give over 30 minutes

Amikacin (Non-proprietary) ^(POM)

Injection, amikacin (as sulphate) 250 mg/mL. Net price 2-mL vial = £10.14

Electrolytes Na⁺ 0.56 mmol/500-mg vial

AMIKACIN (continued)

Amikin® (Bristol-Myers Squibb) (POM)
Injection, amikacin (as sulphate) 250 mg/mL. Net price 2-mL vial = £10.14
 Electrolytes Na⁺ < 0.5 mmol/vial

Paediatric injection, amikacin (as sulphate) 50 mg/mL. Net price 2-mL vial = £2.36
 Electrolytes Na⁺ < 0.5 mmol/vial

TOBRAMYCIN

Cautions see under Gentamicin

Specific cautions for inhaled treatment Other inhaled drugs should be administered before tobramycin; monitor for bronchospasm with initial dose, measure peak flow before and after nebulisation—if bronchospasm occurs, repeat test using bronchodilator; monitor renal function before treatment and then annually; severe haemoptysis

Contra-indications see under Gentamicin

Side-effects see under Gentamicin; *on inhalation*, mouth ulcers, taste disturbances, voice alteration, cough, bronchospasm (see Cautions)

Pharmacokinetics *Intravenous extended interval dose regimen in neonates or multiple daily dose regimen*: one-hour ('peak') serum concentration should not exceed 10 mg/litre (8–12 mg/litre in cystic fibrosis); pre-dose ('trough') concentration should be less than 2 mg/litre

Once daily dose regimen: pre-dose ('trough') concentration should be less than 1 mg/litre

Indication and dose

Neonatal sepsis

- Extended interval dose regimen by intravenous injection over 3–5 minutes or by intravenous infusion

Neonate less than 32 weeks postmenstrual age
 4–5 mg/kg every 36 hours

Neonate 32 weeks and over postmenstrual age
 4–5 mg/kg every 24 hours

- Multiple daily dose regimen by intramuscular injection or by slow intravenous injection or by intravenous infusion

Neonate under 7 days 2 mg/kg every 12 hours

Neonate 7–28 days 2–2.5 mg/kg every 8 hours

Septicaemia, meningitis and other CNS infections, biliary-tract infection, acute pyelonephritis, pneumonia in hospital patients

- Multiple daily dose regimen by slow intravenous injection over 3–5 minutes

Child 1 month–12 years 2–2.5 mg/kg every 8 hours

Child 12–18 years 1 mg/kg every 8 hours; in severe infections up to 5 mg/kg daily in divided

doses every 6–8 hours (reduced to 3 mg/kg daily as soon as clinically indicated)

- Once daily dose regimen by intravenous infusion

Child 1 month–18 years initially 7 mg/kg, then adjusted according to serum-tobramycin concentration

Pseudomonal lung infection in cystic fibrosis

- Multiple daily dose regimen by slow intravenous injection over 3–5 minutes

Child 1 month–18 years 8–10 mg/kg/daily in 3 divided doses

- Once daily dose regimen by intravenous infusion over 30 minutes

Child 1 month–18 years initially 10 mg/kg (max. 660 mg), then adjusted according to serum-tobramycin concentration

Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

- By inhalation of nebulised solution

Child 6–18 years 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

Note Local dosage guidelines may vary. In obese or severely oedematous children use ideal weight for height to calculate the dose. For serum concentration monitoring guidelines see Pharmacokinetics above

Administration for *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 20–60 minutes

Tobramycin (Non-proprietary) (POM)

Injection, tobramycin (as sulphate) 40 mg/mL, net price 1-mL (40-mg) vial = £4.00, 2-mL (80-mg) vial = £4.16, 6-mL (240-mg) vial = £19.20

Bramitob® (Chiesi) (POM)

Nebuliser solution, tobramycin 75 mg/mL, net price 56 x 4-mL (300-mg) unit = £1187.00

Tobi® (Chiron) (POM)

Nebuliser solution, tobramycin 60 mg/mL, net price 56 x 5-mL (300-mg) unit = £1484.00

5.1.5 Macrolides

Erythromycin has an antibacterial spectrum that is similar but not identical to that of penicillin; it is thus an alternative in penicillin-allergic patients.

Indications for erythromycin include respiratory infections, whooping cough, legionnaires' disease, and campylobacter enteritis. It is active against many penicillin-resistant staphylococci but some are now also resistant to erythro-

mycin; it has poor activity against *Haemophilus influenzae*. Erythromycin is also active against chlamydia and mycoplasmas.

Erythromycin causes nausea, vomiting, and diarrhoea in some children; in mild to moderate infections this can be avoided by giving a lower dose or the total dose in 4 divided doses but if a more serious infection, such as *Legionella pneumoniae*, is suspected higher doses are needed.

Clarithromycin is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily.

Azithromycin is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. For treatment of Lyme disease, see section 5.1.1.3. Azithromycin is also used in the treatment of trachoma [unlicensed indication] (section 11.3.1).

Azithromycin and clarithromycin cause fewer gastro-intestinal side-effects than erythromycin.

Spiramycin is also a macrolide (section 5.4.7).

Oral infections Erythromycin is an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to erythromycin or rapidly develop resistance; its use should therefore be limited to short courses. Metronidazole (section 5.1.11) may be preferred as an alternative to a penicillin.

ERYTHROMYCIN

Cautions neonate under 2 weeks (risk of hypertrophic pyloric stenosis); predisposition to QT interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); acute porphyria (section 9.8.2); **interactions:** Appendix 1 (macrolides)

Hepatic impairment may cause idiosyncratic hepatotoxicity

Renal impairment reduce dose in severe renal impairment (ototoxicity)

Pregnancy not known to be harmful

Breast-feeding only small amounts in milk—not known to be harmful

Side-effects nausea, vomiting, abdominal discomfort, diarrhoea (antibiotic-associated colitis reported); less frequently urticaria, rashes and other allergic reactions; reversible hearing loss reported after large doses; cholestatic jaundice, pancreatitis, cardiac effects (including chest pain and arrhythmias), myasthenia-like syndrome, Stevens-Johnson syndrome, and toxic epidermal necrolysis also reported

Indication and dose

Susceptible infections in patients with penicillin hypersensitivity, oral infections (see notes above), campylobacter enteritis, respiratory-tract infections (including legionnaires' disease), skin infections, chlamydial ophthalmia

- By mouth

Neonate 12.5 mg/kg every 6 hours

Child 1 month–2 years 125 mg 4 times daily; dose doubled in severe infections

Child 2–8 years 250 mg 4 times daily; dose doubled in severe infections

Child 8–18 years 250–500 mg 4 times daily; dose doubled in severe infections

Note Total daily dose may be given in two divided doses

- By intermittent intravenous infusion

Neonate 10–12.5 mg/kg every 6 hours

Child 1 month–18 years 12.5 mg/kg (max. 1 g) every 6 hours

- By continuous intravenous infusion

Child 1 month–18 years 50 mg/kg daily (max. 4 g daily); mild infections (oral treatment not possible) 25 mg/kg daily

Early syphilis

- By mouth

Child 12–18 years 500 mg 4 times daily for 14 days

Uncomplicated genital chlamydia, non-gonococcal urethritis

- By mouth

Child 12–18 years 500 mg twice daily for 14 days

Prophylaxis against pneumococcal infection

- By mouth

Child 1 month–2 years 125 mg twice daily

Child 2–8 years 250 mg twice daily

Child 8–18 years 500 mg twice daily

Gastric stasis section 1.2

◊ ERYTHROMYCIN (continued)

Acne vulgaris section 13.6

Diphtheria, whooping cough prophylaxis Table 2, section 5.1

Prevention of group A streptococcal infection Table 2, section 5.1

Administration Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of 1 mg/mL for continuous infusion and 1–5 mg/mL for intermittent infusion; give intermittent infusion over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter

Erythromycin (Non-proprietary) ^(PoM)

Capsules, enclosing e/c microgranules, erythromycin 250 mg, net price 28-cap pack = £5.95. Label: 5, 9, 25
Brands include *Tiloryth*[®]

Tablets, e/c, erythromycin 250 mg, net price 28 = £1.93. Label: 5, 9, 25

Dental prescribing on NHS Erythromycin Tablets e/c may be prescribed

Erythromycin Ethyl Succinate (Non-proprietary) ^(PoM)

Oral suspension, erythromycin (as ethyl succinate) for reconstitution with water 125 mg/5 mL, net price 100 mL = £1.71; 250 mg/5 mL, 100 mL = £2.36; 500 mg/5 mL, 100 mL = £3.82. Label: 9

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription
Brands include *Primacin*[®]

Dental prescribing on NHS Erythromycin Ethyl Succinate Oral Suspension may be prescribed

AZITHROMYCIN

Cautions see under Erythromycin; **interactions:** Appendix 1 (macrolides)

Pregnancy manufacturer advises use only if adequate alternatives not available

Breast-feeding present in milk; use only if no suitable alternative

Contra-indications

Hepatic impairment avoid, jaundice reported

Side-effects see under Erythromycin; also anorexia, dyspepsia, flatulence, dizziness, headache, drowsiness, convulsions, arthralgia, and disturbances in taste and smell; *rarely* constipation, hepatitis, hepatic failure, syncope, insomnia, agitation, anxiety, asthenia, paraesthesia, hyperactivity, thrombocytopenia, haemolytic anaemia, interstitial nephritis, acute renal failure, photosensitivity, tooth and tongue discoloration

Licensed use not licensed for typhoid fever or prophylaxis of group A streptococcal infection

Erythromycin Lactobionate (Non-proprietary) ^(PoM)

Intravenous infusion, powder for reconstitution, erythromycin (as lactobionate), net price 1-g vial = £9.98

Erymax[®] (Zeneus) ^(PoM)

Capsules, opaque orange/clear orange, enclosing orange and white e/c pellets, erythromycin 250 mg, net price 28-cap pack = £5.95, 112-cap pack = £23.80. Label: 5, 9, 25

Erythrocin[®] (Abbott) ^(PoM)

Tablets, both f/c, erythromycin (as stearate), 250 mg, net price 20 = £3.64; 500 mg, 20 = £7.28. Label: 9

Dental prescribing on NHS May be prescribed as Erythromycin Stearate Tablets

Erythroped[®] (Abbott) ^(PoM)

Suspension SF, sugar-free, banana-flavoured, erythromycin (as ethyl succinate) for reconstitution with water, 125 mg/5 mL (*Suspension PI SF*), net price 140 mL = £3.18; 250 mg/5 mL, 140 mL = £6.20; 500 mg/5 mL (*Suspension SF Forte*), 140 mL = £10.99. Label: 9

Erythroped A[®] (Abbott) ^(PoM)

Tablets, yellow, f/c, erythromycin 500 mg (as ethyl succinate). Net price 28-tab pack = £10.78. Label: 9
Dental prescribing on NHS May be prescribed as Erythromycin Ethyl Succinate Tablets

Indication and dose

Respiratory-tract infections, otitis media, skin and soft-tissue infections

• By mouth

Child over 6 months 10 mg/kg once daily (max. 500 mg once daily) for 3 days

or

Body-weight 15–25 kg 200 mg once daily for 3 days

Body-weight 26–35 kg 300 mg once daily for 3 days

Body-weight 36–45 kg 400 mg once daily for 3 days

Body-weight over 45 kg 500 mg once daily for 3 days

Infection in cystic fibrosis

• By mouth

Child 6 months–18 years 10 mg/kg once daily (max. 500 mg once daily) for 3 days; course repeated after 1 week, then repeat as necessary

▢ AZITHROMYCIN (continued)

Chronic *Pseudomonas aeruginosa* infection in cystic fibrosis

- **By mouth**
 - Child 6–18 years**
 - Body-weight 25–40 kg** 250 mg 3 times a week
 - Body-weight over 40 kg** 500 mg 3 times a week

Uncomplicated genital chlamydial infections and non-gonococcal urethritis

- **By mouth**
 - Child 12–18 years** 1 g as a single dose

Mild to moderate typhoid due to multiple-antibacterial resistant organisms

- **By mouth**
 - Child 6 months–18 years** 10 mg/kg once daily (max. 500 mg) for 7 days

Prevention of group A streptococcal infection

Table 2, section 5.1

CLARITHROMYCIN

Cautions see under Erythromycin; **interactions:** Appendix 1 (macrolides)

Hepatic impairment hepatic dysfunction including jaundice reported

Renal impairment use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²; avoid *Klaricid XL*® if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding manufacturer advises avoid unless potential benefit outweighs risk—present in milk

Side-effects see under Erythromycin; also dyspepsia, tooth and tongue discoloration, smell and taste disturbances, stomatitis, glossitis, and headache; *less commonly* hepatitis, arthralgia, and myalgia; *rarely* tinnitus; *very rarely* pancreatitis, dizziness, insomnia, nightmares, anxiety, confusion, psychosis, paraesthesia, convulsions, hypoglycaemia, renal failure, leucopenia, and thrombocytopenia; on intravenous infusion, local tenderness, phlebitis

Licensed use intravenous route not licensed for use in children

Indication and dose

Respiratory-tract infections, mild to moderate skin and soft tissue infections, otitis media

- **By mouth**

Neonate 7.5 mg/kg twice daily

Child 1 month–12 years

Body-weight under 8 kg 7.5 mg/kg twice daily

Body-weight 8–11 kg 62.5 mg twice daily

Body-weight 12–19 kg 125 mg twice daily

Body-weight 20–29 kg 187.5 mg twice daily

Body-weight 30–40 kg 250 mg twice daily

Azithromycin (Non-proprietary) (POM)

Capsules, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £8.77, 6-cap pack = £13.16. Label: 5, 9, 23

Tablets, azithromycin (as monohydrate hemi-ethanolate) 250 mg, net price 4-tab pack = £9.05; 500 mg, 3-tab pack = £9.19. Label: 5, 9

1. Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to max. single dose of 1 g, max. daily dose 1 g, and a pack size of 1 g

Zithromax® (Pfizer) (POM)

Capsules, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £8.95, 6-cap pack = £13.43. Label: 5, 9, 23

Oral suspension, cherry/banana-flavoured, azithromycin (as dihydrate) 200 mg/5 mL when reconstituted with water. Net price 15-mL pack = £5.08, 22.5-mL pack = £7.62, 30-mL pack = £13.80. Label: 5, 9

Dental prescribing on NHS May be prescribed as Azithromycin Oral Suspension 200 mg/5 mL

Child 12–18 years 250 mg twice daily for 7 days, increased if necessary in severe infections to 500 mg every 12 hours for up to 14 days

- **By intravenous infusion into large proximal vein**

Child 1 month–12 years 7.5 mg/kg every 12 hours

Child 12–18 years 500 mg every 12 hours

Helicobacter pylori eradication section 1.3

Administration for intermittent intravenous infusion dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% or Ringer's solution or Compound sodium lactate to a concentration of 2 mg/mL; give into large proximal vein over 60 minutes

Clarithromycin (Non-proprietary) (POM)

Tablets, clarithromycin 250 mg, net price 14-tab pack = £3.55; 500 mg, 14-tab pack = £7.02. Label: 9

Clarosip® (Grünenthal) (POM)

Granules, clarithromycin 125 mg/straw, net price 14-straw pack = £6.70; 187.5 mg/straw, 14-straw pack = £9.70; 250 mg/straw, 14-straw pack = £12.70. Label: 9, counselling, administration

Counselling. Place straw in cold or warm drink such as water, carbonated drink, or tea (but **not full fat milk**, milkshake, or drink with solid particles) and sip drink through straw; several sips may be required to obtain full dose

Klaricid® (Abbott) (POM)

Tablets, both yellow, f/c, clarithromycin 250 mg, net price 14-tab pack = £7.43; 500 mg, 14-tab pack = £12.00, 20-tab pack = £17.14. Label: 9

Paediatric suspension, clarithromycin for reconstitution with water 125 mg/5 mL, net price 70 mL

CLARITHROMYCIN (continued)

= £5.58, 100 mL = £9.60; 250 mg/5 mL, 70 mL = £11.16. Label: 9

Granules, clarithromycin 250 mg/sachet, net price 14-sachet pack = £11.68. Label: 9, 13

Intravenous infusion, powder for reconstitution, clarithromycin. Net price 500-mg vial = £11.46

Electrolytes Na⁺ < 0.5 mmol/500-mg vial

Klaricid XL® (Abbott) (POM)

Tablets, m/r, yellow, clarithromycin 500 mg, net price 7-tab pack = £6.72, 14-tab pack = £13.23. Label: 9, 21, 25

Dose

- **By mouth**

Child 12–18 years 500 mg once daily (doubled in severe infections) for 7–14 days

5.1.6 Clindamycin

Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

Clindamycin is recommended for staphylococcal joint and bone infections such as osteomyelitis, and intra-abdominal sepsis; it is an alternative to macrolides for erysipelas or cellulitis in penicillin-allergic patients. It is also used in combination with other antibacterials for cellulitis in immunocompromised children. Clindamycin can also be used for infections associated with methicillin-resistant *Staphylococcus aureus* (MRSA) in bone and joint infections, and skin and soft-tissue infections.

Clindamycin has been associated with antibiotic-associated colitis (section 1.5), which may be fatal. Although it can occur with most antibacterials, antibiotic-associated colitis occurs more frequently with clindamycin. Children should therefore discontinue treatment immediately if diarrhoea develops.

Oral infections Clindamycin should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

CLINDAMYCIN

Cautions discontinue immediately if diarrhoea or colitis develops; monitor liver and renal function on prolonged therapy and in neonates and infants; avoid rapid intravenous administration; avoid in acute porphyria (section 9.8.2); **interactions**: Appendix 1 (clindamycin)

Pregnancy not known to be harmful

Breast-feeding amount probably too small to be harmful; bloody diarrhoea reported in 1 infant

Contra-indications diarrhoeal states; avoid injections containing benzyl alcohol in neonates (see under preparations below)

Side-effects diarrhoea (discontinue treatment), abdominal discomfort, oesophagitis, oesophageal ulcers, taste disturbances, nausea, vomiting, antibiotic-associated colitis; jaundice; leucopenia, eosinophilia, and thrombocytopenia reported; rash, pruritus, urticaria, anaphylactoid reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative and vesiculobullous dermatitis reported; pain, induration, and abscess after intramuscular injection; thrombophlebitis after intravenous injection

Indication and dose

Staphylococcal bone and joint infections, peritonitis see notes above

- **By mouth**

Neonate under 14 days 3–6 mg/kg 3 times daily

Neonate 14–28 days 3–6 mg/kg 4 times daily

Child 1 month–12 years 3–6 mg/kg 4 times daily (body-weight under 10 kg, minimum dose 37.5 mg 3 times daily)

Child 12–18 years 150–300 mg 4 times daily; in severe infections 450 mg 4 times daily

- **By deep intramuscular injection or by intravenous infusion**

Child 1 month–12 years 3.75–6.25 mg/kg 4 times daily; increased up to 10 mg/kg 4 times daily in severe infections; total daily dose may alternatively be given in 3 divided doses

Child 12–18 years 150–675 mg 4 times daily; total daily dose may alternatively be given in 2–3 divided doses; in life-threatening infection up to 1.2 g 4 times daily; single doses above 600 mg by intravenous infusion only; single doses by intravenous infusion not to exceed 1.2 g

Staphylococcal lung infection in cystic fibrosis

- **By mouth**

Child 1 month–18 years 5–7 mg/kg (max. 600 mg) 4 times daily

Treatment of falciparum malaria, see p. 395

Administration for intravenous infusion, dilute to a concentration of not more than 18 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 10–60 minutes at a max. rate of 20 mg/kg/hour

◊ CLINDAMYCIN (continued)

Clindamycin (Non-proprietary) (POM)

Capsules, clindamycin (as hydrochloride) 150 mg, net price 24-cap pack = £24.87. Label: 9, 27, counselling, see above (diarrhoea)

Dental prescribing on NHS Clindamycin Capsules may be prescribed

Liquid, 75 mg/5 mL available from 'special-order' manufacturers or specialist importing companies, see p. 943

Dalacin C® (Pharmacia) (POM)

Capsules, clindamycin (as hydrochloride) 75 mg (lavender), net price 24-cap pack = £7.45; 150 mg, (lavender/maroon), 24-cap pack = £13.72. Label: 9, 27, counselling, see above (diarrhoea)

Dental prescribing on NHS May be prescribed as Clindamycin Capsules

Injection, clindamycin (as phosphate) 150 mg/mL, net price 2-mL amp = £6.20; 4-mL amp = £12.35

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 3)

5.1.7 Some other antibacterials

Antibacterials discussed in this section include chloramphenicol, fusidic acid, glycopeptide antibiotics (vancomycin and teicoplanin), linezolid, the streptogramins (quinupristin and dalbapristin) and the polymyxin, colistin.

Chloramphenicol

Chloramphenicol is a potent broad-spectrum antibiotic; however, it is associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections, particularly those caused by *Haemophilus influenzae*, and also for typhoid fever. Chloramphenicol is also used in cystic fibrosis for the treatment of respiratory *Burkholderia cepacia* infection resistant to other antibacterials.

Grey baby syndrome may follow excessive doses in neonates with immature hepatic metabolism; monitoring of plasma concentrations is recommended.

Chloramphenicol eye drops (section 11.3.1) and chloramphenicol ear drops (section 12.1.1) are also available.

CHLORAMPHENICOL

Cautions avoid repeated courses and prolonged treatment; blood counts required before and periodically during treatment; monitor plasma-chloramphenicol concentration in neonates (see below); **interactions:** Appendix 1 (chloramphenicol)

Hepatic impairment avoid if possible—increased risk of bone-marrow depression; reduce dose and monitor plasma-chloramphenicol concentration

Renal impairment avoid in severe impairment unless no alternative; dose-related depression of haematopoiesis

Contra-indications acute porphyria (section 9.8.2)

Pregnancy neonatal grey-baby syndrome if used in third trimester

Breast-feeding use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause 'grey-baby syndrome'

Side-effects blood disorders including reversible and irreversible aplastic anaemia (with reports of resulting leukaemia), peripheral neuritis, optic neuritis, headache, depression, urticaria, erythema multiforme, nausea, vomiting, diarrhoea, stomatitis, glossitis, dry mouth; nocturnal haemoglobinuria reported; grey syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism (see Pharmacokinetics below)

Pharmacokinetics plasma concentration monitoring required in neonates and preferred in those under 4 years of age, and in hepatic impairment; recommended peak plasma concentration (approx. 1 hour after end of intravenous injection or infusion or 2 hours after oral administration) 15–25 mg/litre; pre-dose ('trough') concentration should not exceed 15 mg/litre

Indication and dose

See notes above

• By intravenous injection

Neonate up to 14 days 12.5 mg/kg twice daily

Neonate 14–28 days 12.5 mg/kg 2–4 times daily

Note Check dosage carefully; overdosage can be fatal (see also pharmacokinetics above)

• By mouth or by intravenous injection or infusion

Child 1 month–18 years 12.5 mg/kg every 6 hours; dose may be doubled in severe infections such as septicæmia, meningitis and epiglottitis providing plasma-chloramphenicol concentrations are measured and high doses reduced as soon as indicated

Administration Displacement value may be significant for injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%

◊ CHLORAMPHENICOL (continued)

Chloramphenicol (Non-proprietary) (POM)

Capsules, chloramphenicol 250 mg. Net price 60 = £377.00

- Extemporaneous formulations available see Extemporaneous Preparations, p. 8

Kemicetine® (Pharmacia) (POM)

Injection, powder for reconstitution, chloramphenicol (as sodium succinate). Net price 1-g vial = £1.39

Electrolytes Na⁺ 3.14 mmol/g

Fusidic acid

Fusidic acid and its salts are narrow-spectrum antibiotics. The only indication for their use is in infections caused by penicillin-resistant staphylococci, especially osteomyelitis, as they are well concentrated in bone; they are also used for staphylococcal endocarditis. A second antistaphylococcal antibiotic is usually required to prevent emergence of resistance during treatment.

SODIUM FUSIDATE

Cautions monitor liver function with high doses, on prolonged therapy or in hepatic impairment; elimination may be reduced in hepatic impairment or biliary disease or biliary obstruction; **interactions:** Appendix 1 (fusidic acid)

Hepatic impairment impaired biliary excretion, avoid or reduce dose; possibly increased risk of hepatotoxicity, monitor liver function

Pregnancy not known to be harmful; manufacturer advises use only if potential benefit outweighs risk

Breast-feeding present in milk; manufacturer advises caution

Side-effects nausea, vomiting, reversible jaundice, especially after high dosage or rapid infusion (withdraw therapy if persistent); rarely hypersensitivity reactions, acute renal failure (usually with jaundice), blood disorders

Indication and dose

Penicillin-resistant staphylococcal infection including osteomyelitis, staphylococcal endocarditis in combination with other antibacterials see under Preparations, below

Sodium fusidate (LEO) (POM)

Intravenous infusion, powder for reconstitution, sodium fusidate 500 mg (= fusidic acid 480 mg), with buffer, net price per vial (with diluent) = £70.04

Electrolytes Na⁺ 3.1 mmol/vial when reconstituted with buffer

Dose

As sodium fusidate

- By intravenous infusion

Neonate 10 mg/kg every 12 hours

Child 1 month–18 years 6–7 mg/kg (max. 500 mg) every 8 hours

Administration reconstitute with buffer solution provided; further dilute to 1 mg/mL with Sodium chloride 0.9% or Glucose 5% intravenous infusion (but see below); infuse over at least 6 hours via a superficial vein or 2 hours via a central venous line; incompatible in solution of pH less than 7.4

Fucidin® (LEO) (POM)

Tablets, f/c, sodium fusidate 250 mg, net price 10-tab pack = £6.02. Label: 9

Dose

as sodium fusidate

Child 12–18 years 500 mg every 8 hours, dose doubled for severe infections

Skin infection as sodium fusidate

Child 12–18 years 250 mg every 12 hours for 5–10 days

Suspension, off-white, banana- and orange-flavoured, fusidic acid 250 mg/5 mL, net price 50 mL = £6.73. Label: 9, 21

Dose

As fusidic acid

Neonate 15 mg/kg 3 times daily

Child 1 month–1 year 15 mg/kg 3 times daily

Child 1–5 years 250 mg 3 times daily

Child 5–12 years 500 mg 3 times daily

Child 12–18 years 750 mg 3 times daily

Note Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets

Vancomycin and teicoplanin

The glycopeptide antibiotics vancomycin and teicoplanin have bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant *Staphylococci*. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant *Enterococci*.

Vancomycin is used by the intravenous route in the prophylaxis and treatment of serious infections caused by Gram-positive cocci. Vancomycin is principally excreted via the kidney and dose reduction is necessary in renal impairment.

Penetration in to cerebrospinal fluid is poor; vancomycin may be administered by the intrathecal or intraventricular route for treatment of meningitis [unlicensed]. Vancomycin (added to dialysis fluid) is also used in the treatment of peritonitis associated with peritoneal dialysis [unlicensed route] (Table 1 section 5.1).

Vancomycin given by *mouth* for 7–10 days is effective in the treatment of *Clostridium difficile* infection (see also section 1.5); low doses (see below) are considered adequate (higher dose may be considered if the infection fails to respond or if it is severe). Vancomycin is also used by mouth in prophylaxis of neonatal necrotising enterocolitis. Vancomycin should **not** be given by mouth for systemic infections since it is not significantly absorbed.

Teicoplanin is similar to vancomycin but has a significantly longer duration of action allowing once-daily administration. Plasma concentration monitoring is not usually necessary, but may help optimise therapy. Unlike vancomycin, teicoplanin can be given by intramuscular as well as by intravenous injection; it is not given by mouth.

VANCOMYCIN

Cautions avoid rapid infusion (risk of anaphylactoid reactions, see Side-effects); rotate infusion sites; avoid if history of deafness; all patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment), blood counts, urinalysis, and renal function tests; monitor auditory function in renal impairment; systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses; **interactions:** Appendix 1 (vancomycin)

Renal impairment reduce dose—monitor plasma-vancomycin concentration and renal function regularly

Pregnancy manufacturer advises use only if potential benefit outweighs risk—plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity

Breast-feeding present in milk—significant absorption following oral administration unlikely

Side-effects after parenteral administration: nephrotoxicity including renal failure and interstitial nephritis; ototoxicity (discontinue if tinnitus occurs); blood disorders including neutropenia (usually after 1 week or high cumulative dose), rarely agranulocytosis and thrombocytopenia; nausea; chills, fever; eosinophilia, anaphylaxis, rashes (including exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis, and vasculitis); phlebitis (irritant to tissue); on rapid infusion, severe hypotension (including shock and cardiac arrest), wheezing, dyspnoea, urticaria, pruritus, flushing of the upper body ('red man' syndrome), pain and muscle spasm of back and chest

Pharmacokinetics plasma concentration monitoring required; pre-dose ('trough') concentration should be 10–15 mg/litre (15–20 mg/litre for less sensitive strains of methicillin-resistant *Staphylococcus aureus*)

Licensed use not licensed for intraventricular use

Indication and dose

Infections due to Gram-positive bacteria including osteomyelitis, septicaemia and soft-tissue infections see notes above

• By intravenous infusion

Neonate less than 29 weeks postmenstrual age
15 mg/kg every 24 hours

Neonate 29-35 weeks postmenstrual age
15 mg/kg every 12 hours

Neonate over 35 weeks postmenstrual age
15 mg/kg every 8 hours

Child 1 month–18 years 15 mg/kg every 8 hours (maximum daily dose 2 g), adjusted according to plasma concentration

***Clostridium difficile* infection** (see also notes above)

• By mouth

Child 1 month–5 years 5 mg/kg 4 times daily for 7–10 days

Child 5–12 years 62.5 mg 4 times daily for 7–10 days

Child 12–18 years 125 mg 4 times daily for 7–10 days

Prophylaxis of necrotising enterocolitis in neonates

• By mouth

Neonate 15 mg/kg 3 times daily

CNS infection e.g. ventriculitis

• By intraventricular administration, seek specialist advice

Neonate 10 mg once every 24 hours

Child 1 month–18 years 10 mg once every 24 hours

Note for all children reduce to 5 mg daily if ventricular size reduced or increase to 15–20 mg once daily if ventricular size increased. Adjust dose according to CSF concentration after 3–4 days; aim for pre-dose ('trough') concentration less than 10 mg/litre. If CSF not draining freely reduce dose frequency to once every 2–3 days

◊ VANCOMYCIN (continued)

Peritonitis associated with peritoneal dialysis

Add to each bag of dialysis fluid to achieve a concentration of 20–25 mg/litre

Note Vancomycin doses in BNF for Children may differ from those in product literature

Administration Displacement value may be significant, consult product literature and local guidelines. For intermittent intravenous infusion, the reconstituted preparation should be further diluted in sodium chloride 0.9% or glucose 5% to a concentration of up to 5 mg/mL; give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not available (limited evidence); 10 mg/mL can be used if infused via a central venous line over at least 1 hour. Injection may be given orally; flavouring syrups may be added to the solution at the time of administration.

Safe Practice For intraventricular administration, seek specialist advice

Vancomycin (Non-proprietary) (POM)

Capsules, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £132.47; 250 mg, 28-cap pack = £132.47. Label: 9

Injection, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £8.05; 1-g vial = £16.11

Note Can be used to prepare solution for oral administration

Vancocin® (Flynn) (POM)

Matrigel capsules, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £88.31. Label: 9

Injection, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £8.05; 1-g vial = £16.11

Note Can be used to prepare solution for oral administration

TEICOPLANIN

Cautions vancomycin sensitivity; blood counts and liver and kidney function tests required—monitor renal and auditory function on prolonged administration during renal impairment or if other nephrotoxic or neurotoxic drugs given; monitor serum-teicoplanin concentration if severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), renal impairment, and in intravenous drug abusers; **interactions:** Appendix 1 (teicoplanin)

Renal impairment reduce dose on day 4: use half normal dose if estimated glomerular filtration rate is 40–60 mL/minute/1.73 m² and use one-third normal dose if estimated glomerular filtration rate is less than 40 mL/minute/1.73 m²

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding no information available

Side-effects nausea, vomiting, diarrhoea; rash, pruritus, fever, bronchospasm, rigors, urticaria, angioedema, anaphylaxis; dizziness, headache; blood disorders including eosinophilia, leucopenia, neutropenia, and thrombocytopenia; disturbances in liver enzymes, transient increase of serum creatinine, renal failure; tinnitus, mild hearing loss, and vestibular disorders also reported; rarely exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis; local reactions include erythema, pain, thrombophlebitis, injection site abscess and rarely flushing with infusion

Pharmacokinetics plasma-teicoplanin concentration is not measured routinely because there is no clear relationship between plasma-teicoplanin concentration and toxicity. However, the plasma-teicoplanin concentration can be used to opti-

mise treatment in some patients (see Cautions). Pre-dose ('trough') concentration should be greater than 10 mg/litre (greater than 15–20 mg/litre in endocarditis) but less than 60 mg/litre

Indication and dose

Potentially serious Gram-positive infections including endocarditis, and serious infections due to Staphylococcus aureus

- By intravenous injection or intravenous infusion over 30 minutes

Neonate initially 16 mg/kg for one dose followed 24 hours later by 8 mg/kg once daily (intravenous infusion only)

Child 1 month–18 years in moderate infections initially 10 mg/kg (max. 400 mg) every 12 hours for 3 doses, then 6 mg/kg (max. 200 mg) once daily; in severe infections or in neutropenia initially 10 mg/kg (max. 400 mg) every 12 hours for 3 doses then 10 mg/kg (max. 400 mg) once daily; after first 3 doses, subsequent doses can be given by intramuscular injection if necessary although intravenous route preferable for children

Administration For intermittent intravenous infusion, dilute reconstituted solution further in sodium chloride 0.9% or glucose 5% or compound sodium lactate intravenous infusion; give over 30 minutes. Intermittent intravenous infusion preferred in neonates

Targocid® (Aventis Pharma) (POM)

Injection, powder for reconstitution, teicoplanin, net price 200-mg vial (with diluent) = £17.58; 400-mg vial (with diluent) = £35.62

Electrolytes Na⁺ < 0.5 mmol/200- and 400-mg vial

Linezolid

Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including methicillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid should be reserved for infections caused by Gram-positive bacteria when the organisms are resistant to other antibacterials or when patients cannot tolerate other antibacterials. Linezolid is **not** active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms. There is limited information on use in children and expert advice should be sought. A higher incidence of blood disorders and optic neuropathy have been reported in patients receiving linezolid for more than the maximum recommended duration of 28 days.

LINEZOLID

Cautions monitor full blood count (including platelet count) weekly (see also CSM Advice below); unless close observation and blood-pressure monitoring possible, avoid in uncontrolled hypertension, pheochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states; **interactions:** Appendix 1 (MAOIs)

Hepatic impairment no dose adjustment necessary but in severe hepatic impairment use only if potential benefit outweighs risk

Renal impairment no dose adjustment necessary but metabolites may accumulate if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

CSM advice Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

CHM advice (optic neuropathy) Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

Monoamine oxidase inhibition Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts,

undistilled alcoholic beverages, and fermented soya bean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, 5HT₂ agonists ('triptans'), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics. For other interactions see Appendix 1 (MAOIs)

Contra-indications see also Monoamine oxidase inhibition above

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects diarrhoea (antibiotic-associated colitis reported), nausea, vomiting, taste disturbances, headache; *less commonly* thirst, dry mouth, glossitis, stomatitis, tongue discoloration, abdominal pain, dyspepsia, gastritis, constipation, pancreatitis, hypertension, fever, fatigue, dizziness, insomnia, hypoaesthesia, paraesthesia, tinnitus, polyuria, anaemia, leucopenia, thrombocytopenia, eosinophilia, electrolyte disturbances, blurred vision, rash, pruritus, diaphoresis, and injection-site reactions; *very rarely* renal failure, pancytopenia and Stevens-Johnson syndrome; also reported, lactic acidosis; peripheral and optic neuropathy reported on prolonged therapy

Licensed use not licensed for use in children

Indication and dose

Pneumonia, complicated skin and soft-tissue infections caused by Gram-positive bacteria (initiated under expert supervision)

- **By mouth or by intravenous infusion over 30–120 minutes**

Neonate under 7 days 10 mg/kg every 12 hours, increase to every 8 hours if poor response

Neonate over 7 days 10 mg/kg every 8 hours

Child 1 month–12 years 10 mg/kg (max. 600 mg) every 8 hours

Child 12–18 years 600 mg every 12 hours

Zyvox® (Pharmacia) ▼ (Pm)

Tablets, f/c, linezolid 600 mg, net price 10-tab pack = £445.00. Label: 9, 10, patient information leaflet

Suspension, yellow, linezolid 100 mg/5 mL when reconstituted with water, net price 150 mL (orange-

LINEZOLID (continued)

flavoured) = £222.50. Label: 9, 10 patient information leaflet

Excipients include aspartame 20 mg/5 mL (section 9.4.1)

Intravenous infusion, linezolid 2 mg/mL, net price 300-mL *Excele*[®] bag = £44.50

Excipients include Na⁺ 5 mmol/300-mL bag, glucose 13.71 g/300-mL bag

Quinupristin and dalfopristin

A combination of the streptogramin antibiotics, **quinupristin** and **dalfopristin** (as *Synercid*[®]) is licensed in adults for infections due to Gram-positive bacteria; there is limited information on use in children and expert advice should be sought. The combination should be reserved for treating infections which have failed to respond to other antibacterials (e.g. methicillin-resistant *Staphylococcus aureus*, MRSA) or for patients who cannot be treated with other antibacterials. Quinupristin and dalfopristin are not active against *Enterococcus faecalis* and they need to be given in combination with other antibacterials for mixed infections which also involve Gram-negative organisms.

QUINUPRISTIN WITH DALFOPRISTIN

A mixture of quinupristin and dalfopristin (both as mesilate salts) in the proportions 3 parts to 7 parts

Cautions predisposition to cardiac arrhythmias (including congenital QT syndrome, concomitant use of drugs that prolong QT interval, cardiac hypertrophy, dilated cardiomyopathy, hypokalaemia, hypomagnesaemia, bradycardia); **interactions:** Appendix 1 (quinupristin with dalfopristin)

Hepatic impairment consider reducing dose to 5 mg/kg every 8 hours in moderate impairment, adjusted according to clinical response; avoid in severe hepatic impairment or if plasma-bilirubin concentration greater than 3 times upper limit of reference range

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—no information available

Contra-indications plasma-bilirubin concentration greater than 3 times upper limit of reference range

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects nausea, vomiting, diarrhoea, headache, arthralgia, myalgia, asthenia, rash, pruritus, anaemia, leucopenia, eosinophilia, raised urea and creatinine; injection-site reactions on peripheral venous administration; less frequently oral candidiasis, stomatitis, constipation, abdominal pain, antibiotic-associated colitis, anorexia, peripheral oedema, hypotension, chest pain, arrhythmias, dyspnoea, hypersensitivity reactions (including anaphylaxis and urticaria), insomnia, anxiety, confusion, dizziness, paraesthesia, hypertonia, hepatitis, jaundice, pancreat-

itis, gout; also reported, thrombocytopenia, pancytopenia, electrolyte disturbances

Licensed use not licensed for use in children

Indication and dose

Serious Gram-positive infections where no alternative antibacterial is suitable including hospital-acquired pneumonia, skin and soft-tissue infections, infections due to vancomycin-resistant *Enterococcus faecium* Dose expressed as a combination of quinupristin and dalfopristin (in a ratio of 3:7)

• **By intravenous infusion into central vein**

Child 1 month–18 years 7.5 mg/kg every 8 hours for 7 days in skin and soft-tissue infections; for 10 days in hospital-acquired pneumonia; duration of treatment in *E. faecium* infection depends on site of infection

Administration Reconstitute 500 mg with 5 mL water for injections or glucose 5%; gently swirl vial without shaking to dissolve; allow to stand for at least 2 minutes until foam disappears; for *intravenous infusion* dilute requisite dose with glucose 5% intravenous infusion to a concentration of 5 mg/mL and give over 60 minutes via central venous catheter. In an emergency, first dose may be diluted to 2 mg/mL and given over 60 minutes via peripheral line; flush line with glucose 5% before and after infusion; incompatible with sodium chloride solutions

Synercid[®] (Nordic) (POM)

Intravenous infusion, powder for reconstitution, quinupristin (as mesilate) 150 mg, dalfopristin (as mesilate) 350 mg, net price 500-mg vial = £37.00
Electrolytes Na⁺ approx. 16 mmol/500-mg vial

Polymyxins

The polymyxin antibiotic, **colistin**, is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and is given by injection for a systemic effect. Intravenous administration of colistin should be reserved for Gram-negative infections resistant to other antibacterials; its major adverse effects are dose-related neurotoxicity and nephrotoxicity.

Colistin is used by mouth in bowel sterilisation regimens in neutropenic patients (usually with nystatin); it is **not** recommended for gastro-intestinal infections. It is also given by inhalation of a nebulised solution as an adjunct to standard antibacterial therapy in patients with cystic fibrosis.

Both colistin and polymyxin B are included in some preparations for topical application.

COLISTIN

Cautions acute porphyria (section 9.8.2); risk of bronchospasm on inhalation—may be prevented or treated with a selective beta₂ agonist; **interactions:** Appendix 1 (polymyxins)

Renal impairment monitor plasma-colistin concentration during parenteral treatment. Reduce parenteral dose in moderate to severe impairment

Contra-indications myasthenia gravis

Pregnancy avoid—possible risk of fetal toxicity especially in second and third trimesters

Breast-feeding present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk)

Side-effects neurotoxicity reported especially with excessive doses (including apnoea, perioral and peripheral paraesthesia, vertigo; rarely vasomotor instability, slurred speech, confusion, psychosis, visual disturbances); nephrotoxicity; hypersensitivity reactions including rash; injection-site reactions; inhalation may cause sore throat, sore mouth, cough, bronchospasm

Pharmacokinetics see notes above; plasma concentration monitoring required for intravenous treatment in renal impairment and cystic fibrosis; recommended 'peak' plasma-colistin concentration (approx. 30 minutes after intravenous injection or infusion) 10–15 mg/litre (125–200 units/mL); colistin sulphate may be absorbed from the gastro-intestinal tract in infants under 6 months old

Indication and dose

***Pseudomonas aeruginosa* infection in cystic fibrosis**

• By slow intravenous injection into a totally implantable venous access device, or by intravenous infusion (but see notes above)

Child 1 month–18 years

Body-weight under 60 kg 16 666–25 000 units/kg every 8 hours

Body-weight over 60 kg 1–2 million units every 8 hours

• **By inhalation of nebulised solution**

Child 1 month–2 years 500 000–1 million units twice daily

Child 2–18 years 1–2 million units twice daily

Administration For *intravenous infusion*, dilute to a concentration of 40 000 units/mL with Sodium Chloride 0.9%; give over 30 minutes

For *slow intravenous injection* into a totally implantable venous access device, dilute to a concentration of 90 000 units/mL for child under 12 years (200 000 units/mL for child over 12 years)

For *nebulisation* administer required dose in 2–4 mL of sodium chloride 0.9% (or water for injections). Colistin must not be mixed with tobramycin as they are chemically unstable together; it may be mixed with gentamicin if used immediately

Colomycin[®] (Forest) (Pm)

Injection, powder for reconstitution, colistimethate sodium (colistin sulphomethate sodium). Net price 1 million-unit vial = £1.68; 2 million-unit vial = £3.09

Electrolytes (before reconstitution) Na⁺ < 0.5 mmol/500 000-unit, 1 million-unit, and 2 million-unit vial

Note *Colomycin*[®] Injection (dissolved in physiological saline) may be used for nebulisation

Promixin[®] (Profile) (Pm)

Powder for nebuliser solution, colistimethate sodium (colistin sulphomethate sodium), net price 1 million-unit vial = £4.60.

Injection, powder for reconstitution, colistimethate sodium (colistin sulphomethate sodium), net price 1 million unit-vial = £2.30

Electrolytes (before reconstitution) Na⁺ < 0.5 mmol/1 million-unit vial

5.1.8 Sulphonamides and trimethoprim

The importance of the sulphonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

Sulfamethoxazole (sulphamethoxazole) and trimethoprim are used in combination (as **co-trimoxazole**) because of their synergistic activity. However, co-trimoxazole is associated with rare but serious side-effects e.g. Stevens-Johnson syndrome and blood dyscrasias, notably bone marrow depression and agranulocytosis (see CSM recommendations below). Co-trimoxazole should be avoided in children less than 6 weeks of age (except for treatment and prophylaxis of *pneumocystis pneumonia*) because of the risk of kernicterus. There is a risk of haemolytic anaemia if used in children with glucose-6-phosphate dehydrogenase (G6PD) deficiency (section 9.1.5).

CSM recommendations

Co-trimoxazole should be limited to the role of drug of choice in *Pneumocystis jiroveci* (*Pneumocystis carinii*) pneumonia; it is also indicated for toxoplasmosis and nocardiosis. It should now only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is good bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it.

Trimethoprim can be used alone for urinary- and respiratory-tract infections and for shigellosis and invasive salmonella infections. Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.

For topical preparations of sulphonamides used in the treatment of burns see section 13.10.1.1.

CO-TRIMOXAZOLE

A mixture of trimethoprim and sulfamethoxazole in the proportions of 1 part to 5 parts

Cautions maintain adequate fluid intake; avoid in blood disorders (unless under specialist supervision); monitor blood counts on prolonged treatment; discontinue immediately if blood disorders or rash develop; predisposition to folate deficiency; asthma; G6PD deficiency (section 9.1.5); avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia); **interactions:** Appendix 1 (trimethoprim, sulfamethoxazole)

Hepatic impairment manufacturer advises avoid in severe liver disease

Renal impairment use half normal dose if estimated glomerular filtration rate 15–30 mL/minute/1.73 m²; avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored

Pregnancy teratogenic risk (trimethoprim a folate antagonist) in first trimester neonatal haemolysis and methaemoglobinaemia in 3rd trimester; fear of increased risk of kernicterus in neonates appears to be unfounded

Breast-feeding small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole)

Contra-indications acute porphyria (section 9.8.2)

Side-effects nausea, diarrhoea; headache, hyperkalaemia; rash (*very rarely* including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity)—discontinue immediately; *less commonly* vomiting; *very rarely* glossitis, stomatitis, anorexia, liver damage (including jaundice and hepatic necrosis), pancreatitis, antibiotic-associated colitis, myocarditis, cough and shortness of breath, pulmonary infiltrates, aseptic meningitis, depression, convulsions, peripheral neuropathy, ataxia, tinnitus, vertigo, hallucinations, hypoglycaemia, blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia), hyponatraemia, renal disorders including interstitial nephritis, arthralgia, myalgia, vasculitis, systemic lupus erythematosus, and uveitis; rhabdomyolysis reported in HIV-infected patients

Pharmacokinetics plasma concentration monitoring may be required with high doses or during moderate to severe renal impairment; seek expert advice

Licensed use not licensed for use in children under 6 weeks

Indication and dose

Treatment of susceptible infections (but see notes above) dose expressed as co-trimoxazole

• By mouth

Child 6 weeks–12 years 24 mg/kg twice daily *or*

Child 6 weeks–6 months 120 mg twice daily

Child 6 months–6 years 240 mg twice daily

Child 6–12 years 480 mg twice daily

Child 12–18 years 960 mg twice daily

• By intravenous infusion

Child 6 weeks–18 years 18 mg/kg every 12 hours; increased in severe infection to 27 mg/kg (max. 1.44 g) every 12 hours

Treatment of *Pneumocystis jiroveci* (*P. carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)

• By mouth or by intravenous infusion

Child 1 month–18 years 60 mg/kg every 12 hours for 14 days; total daily dose may alternatively be given in 3–4 divided doses

Note oral route preferred

Prophylaxis of *Pneumocystis jiroveci* (*P. carinii*) infections

• By mouth

Child 1 month–18 years 450 mg/m² (max 960 mg) twice daily for three days of the week (either consecutively or on alternate days)

Note dose regimens may vary, consult local guidelines

Note 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg

Administration for intermittent intravenous infusion may be further diluted in glucose 5% and 10% or sodium chloride 0.9% or Ringer's intravenous solution. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested

CO-TRIMOXAZOLE (continued)

duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In severe fluid restriction may be given undiluted via a central venous line

Co-trimoxazole (Non-proprietary) (PoM)

Tablets, co-trimoxazole 480 mg, net price 28-tab pack = £13.83; 960 mg, 20 = £4.69. Label: 9
Brands include *Fectrim*[®], *Fectrim*[®] *Forte*

Paediatric oral suspension, co-trimoxazole 240 mg/5 mL, net price 100 mL = £1.12. Label: 9

Oral suspension, co-trimoxazole 480 mg/5 mL. Net price 100 mL = £4.41. Label: 9

Strong sterile solution, co-trimoxazole 96 mg/mL. For dilution and use as an intravenous infusion. Net price 5-mL amp = £1.58, 10-mL amp = £3.06

Septrin[®] (GSK) (PoM)

Tablets, co-trimoxazole 480 mg. Net price 20 = £3.10. Label: 9

Forte tablets, scored, co-trimoxazole 960 mg. Net price 20 = £4.69. Label: 9

Adult suspension, co-trimoxazole 480 mg/5 mL. Net price 100 mL (vanilla-flavoured) = £4.41. Label: 9

Paediatric suspension, sugar-free, co-trimoxazole 240 mg/5 mL. Net price 100 mL (banana- and vanilla-flavoured) = £2.45. Label: 9

Intravenous infusion, co-trimoxazole 96 mg/mL. To be diluted before use. Net price 5-mL amp = £1.48

Excipients include propylene glycol, sulphites

TRIMETHOPRIM

Cautions predisposition to folate deficiency; manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory); neonates (specialist supervision required); acute porphyria (section 9.8.2); **interactions:** Appendix 1 (trimethoprim)

Renal impairment use half normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m²; use half normal dose immediately if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² (monitor plasma trimethoprim concentration if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²)

Breast-feeding present in milk—short-term use not known to be harmful

Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop

Contra-indications blood dyscrasias

Pregnancy teratogenic risk (folate antagonist) in first trimester; manufacturers advise avoid

Side-effects gastro-intestinal disturbances including nausea and vomiting, pruritus, rashes, hyperkalaemia, depression of haematopoiesis; rarely erythema multiforme, toxic epidermal necrolysis, photosensitivity and other allergic reactions including angioedema and anaphylaxis; aseptic meningitis reported

Licensed use not licensed for use in children under 6 weeks

Indication and dose

Urinary-tract infections; respiratory-tract infections

• By mouth

Neonate initially 3 mg/kg as a single dose then 1–2 mg/kg twice daily

Child 1 month–12 years 4 mg/kg (max. 200 mg) twice daily

or

Child 6 weeks–6 months 25 mg twice daily

Child 6 months–6 years 50 mg twice daily

Child 6–12 years 100 mg twice daily

Child 12–18 years 200 mg twice daily

Prophylaxis of urinary-tract infection

• By mouth

Neonate 2 mg/kg at night

Child 1 month–12 years 2 mg/kg (max. 100 mg) at night

Child 12–18 years 100 mg at night

Pneumocystis pneumonia see , p 411

Trimethoprim (Non-proprietary) (PoM)

Tablets, trimethoprim 100 mg, net price 28 = 98p; 200 mg, 14-tab pack = 90p. Label: 9
Brands include *Trimopan*[®]

Suspension, trimethoprim 50 mg/5 mL, net price 100 mL = £1.62. Label: 9

5.1.9 Antituberculosis drugs

Tuberculosis is treated in two phases—an *initial phase* using 4 drugs and a *continuation phase* using two drugs in fully sensitive cases. Treatment requires specialised knowledge, particularly where the disease involves resistant organisms or non-respiratory organs.

The regimens given below are recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or

the supervised regimen described below should be used; the two regimens should **not** be used concurrently. Compliance with therapy is a major determinant of its success. Treatment needs to be carefully monitored in families in whom concordance may be problematic.

Initial phase The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations, provided the respective dose of each drug is appropriate, unless the child is unable to swallow the tablets or one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid, rifampicin, pyrazinamide and ethambutol. However, care is needed in young children receiving ethambutol because of the difficulty in testing eyesight and in obtaining reports of visual symptoms (see below). Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin is rarely used in the UK although it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced and ethambutol is contra-indicated.

Continuation phase After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment The following regimen should be used for those who are likely to take antituberculous drugs reliably **without supervision**. Children and families who are unlikely to comply with daily administration of antituberculous drugs should be treated with the regimen described under Supervised Treatment.

Recommended dosage for standard unsupervised 6-month treatment

Isoniazid (for 2-month initial and 4-month continuation phases)

Child 1 month–18 years 5–10 mg/kg (max. 300 mg) once daily

Rifampicin (for 2-month initial and 4-month continuation phase)

Child 1 month–18 years 10 mg/kg once daily (max. 450 mg if body-weight under 50 kg; if body-weight 50 kg and over max. 600 mg)

Pyrazinamide (for 2-month initial phase only)

Child 1 month–18 years 35 mg/kg once daily (max. 1.5 g if body-weight under 50 kg; if body-weight 50 kg and over max. 2 g)

Ethambutol (for 2-month initial phase only)

Child 1 month–18 years 15 mg/kg once daily

Note In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children.

The fixed-dose combination preparations (*Rifater*[®], *Rifinah*[®]) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

Pregnancy and breast-feeding The standard regimen (above) may be used during pregnancy and breast-feeding. Streptomycin should not be given in pregnancy.

Neonates Congenital tuberculosis is acquired from maternal extrapulmonary sites at birth, particularly the genital tract; if infection is suspected, the baby will require treatment with isoniazid 10 mg/kg once daily, rifampicin 10 mg/kg once daily, pyrazinamide 35 mg/kg once daily, and ethambutol 15 mg/kg once daily. Isoniazid, rifampicin, pyrazinamide, and ethambutol are used for 2 months during the initial phase of treatment. After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin.

Supervised treatment Drug administration needs to be **fully supervised** (directly observed therapy, DOT) in children or families who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

Recommended dosage for intermittent supervised 6-month treatment

Isoniazid (for 2-month initial and 4-month continuation phases)
Child 1 month–18 years, 15 mg/kg (max. 900 mg) 3 times a week

Rifampicin (for 2-month initial and 4-month continuation phases)
Child 1 month–18 years, 15 mg/kg (max. 900 mg) 3 times a week

Pyrazinamide (for 2-month initial phase only)
Child 1 month–18 years, 50 mg/kg (max. 2 g 3 times a week if body-weight under 50 kg; max. 2.5 g 3 times a week if body-weight 50 kg and over)

Ethambutol (for 2-month initial phase only)
Child 1 month–18 years, 30 mg/kg 3 times a week

Note In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children.

The fixed-dose combination preparations (*Rifater*[®], *Rifinah*[®]) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

Immunocompromised patients Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised children. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, children should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a HIV-positive individual; care is required in choosing the regimen and in avoiding potentially hazardous interactions. Starting antiretroviral treatment in the first 2 months of antituberculosis treatment increases the risk of immune reconstitution syndrome.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex in which case specialist advice on management is needed.

Corticosteroids A corticosteroid should be given (in addition to antituberculosis therapy) for meningeal or pericardial tuberculosis.

Prevention of tuberculosis Chemoprophylaxis may be required in children who are close contacts of a case of smear-positive pulmonary tuberculosis and who are severely immunosuppressed (including congenital immunodeficiencies, cytotoxic or immunosuppressive therapy) and in those who have evidence of latent tuberculosis and require treatment with immunosuppressants; expert advice should be sought.

Chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months (see Table 2, section 5.1).

For prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive, see Table 2, section 5.1. For advice on immunisation against tuberculosis and tuberculin testing, see section 14.4.

Monitoring Since isoniazid, rifampicin and pyrazinamide are associated with liver toxicity, *hepatic function* should be checked before treatment with these drugs. Those with pre-existing liver disease should have frequent checks particularly in the first 2 months. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. In view of the need to comply fully with antituberculous treatment on the one hand and to guard against serious liver damage on the other, children and their carers should be informed carefully how to recognise signs of liver disorders

and advised to discontinue treatment and seek **immediate** medical attention should symptoms of liver disease occur.

Renal function should be checked before treatment with antituberculous drugs and appropriate dosage adjustments made. Streptomycin or ethambutol should preferably be avoided in patients with renal impairment, but if used, the dose should be reduced and the plasma-drug concentration monitored.

Visual acuity should be tested before ethambutol is used (see below).

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the child or their carer. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist paediatrician.

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication. Its only common side-effect is peripheral neuropathy which is more likely to occur where there are pre-existing risk factors such as diabetes, chronic renal failure, malnutrition and HIV infection. In these circumstances, and in breast-fed infants treated with isoniazid, pyridoxine (section 9.6.2) should be given prophylactically from the start of treatment. Other side-effects such as hepatitis (important: see Monitoring above) and psychosis are rare.

Rifampicin, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months ('initial phase') of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease (important: see Monitoring above).

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients.

Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens, corticosteroids, phenytoin, sulphonylureas, and anticoagulants; **interactions:** Appendix 1 (rifamycins). **Important:** the effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered (section 7.3.1).

Rifabutin is indicated in adults for *prophylaxis* against *M. avium* complex infections in patients with a low CD4 count; it is also licensed in adults for the *treatment* of non-tuberculous mycobacterial disease and pulmonary tuberculosis. There is limited experience in children. As with rifampicin it induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced requiring alternative family planning methods.

Pyrazinamide is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium tuberculosis*; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*. Serious liver toxicity may occasionally occur (important: see Monitoring above).

Ethambutol is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Side-effects of ethambutol are largely confined to visual disturbances in the form of loss of acuity, colour blindness, and restriction of visual fields. These toxic effects are more common where excessive dosage is used or if the child's renal function is impaired. The earliest features of ocular toxicity are subjective and children and their carers should be advised to discontinue therapy immediately if deterioration in vision develops and promptly seek further advice. Early discontinuation of the drug is almost always followed by recovery of eyesight. Those who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

Where possible visual acuity should be tested by Snellen chart before treatment with ethambutol.

Streptomycin is now rarely used in the UK except for resistant organisms. Plasma-drug concentration should be measured in patients with impaired renal function in whom streptomycin must be used with great care. Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

Drug-resistant tuberculosis should be treated by a specialist paediatrician with experience in such cases, and where appropriate facilities for infection-control exist. Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include amikacin, capreomycin, cycloserine, newer macrolides (e.g. azithromycin and clarithromycin), quinolones (e.g. moxifloxacin) and protonamide (prothionamide; no longer on UK market). Availability of suitable formulations may limit choice in children.

CYCLOSERINE

Cautions monitor haematological, renal, and hepatic function; **interactions:** Appendix 1 (cycloserine)

Renal impairment reduce dose; avoid in severe impairment

Pregnancy manufacturer advises use only if potential benefit outweighs risk—crosses the placenta

Breast-feeding present in milk—amount too small to be harmful

Contra-indications epilepsy, depression, severe anxiety, psychotic states, alcohol dependence, acute porphyria (section 9.8.2)

Side-effects mainly neurological, including headache, dizziness, vertigo, drowsiness, tremor, convulsions, confusion, psychosis, depression (discontinue or reduce dose if symptoms of CNS toxicity); rashes, allergic dermatitis (discontinue or reduce dose); megaloblastic anaemia; changes in liver function tests; heart failure at high doses reported

Pharmacokinetics blood concentration should not exceed a peak concentration of 30 mg/litre (measured 3–4 hours after the dose); penetrates CNS

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Tuberculosis resistant to first-line drugs, used in combination with other drugs

• By mouth

Child 2–12 years initially 5 mg/kg twice daily, adjusted according to blood concentration and response

Child 12–18 years initially 250 mg twice daily for 2 weeks adjusted according to blood concentration and response to max. 500 mg twice daily

Cycloserine (King) (PoM)

Capsules, red/grey cycloserine 250 mg, net price 100-cap pack = £303.45. Label: 2, 8

ETHAMBUOL HYDROCHLORIDE

Cautions test visual acuity before treatment and warn patients to report visual changes—see notes above; young children (see notes above)—routine ophthalmological monitoring recommended

Renal impairment reduce dose; if creatinine clearance less than 30 mL/minute/1.73 m² monitor plasma-ethambutol concentration; risk of optic nerve damage

Pregnancy not known to be harmful; see notes above

Breast-feeding amount too small to be harmful

Contra-indications optic neuritis, poor vision

Side-effects optic neuritis, red/green colour blindness, peripheral neuritis, rarely rash, pruritus, urticaria, thrombocytopenia

Pharmacokinetics 'peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–

22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre); for advice on laboratory assay of ethambutol contact the Poisons Unit at New Cross Hospital (Tel (020) 7771 5360)

Indication and dose

Tuberculosis, used in combination with other drugs see notes above

Ethambutol (Non-proprietary) (PoM)

Tablets, ethambutol hydrochloride 100 mg (yellow), net price 56-tab pack = £11.51; 400 mg (grey), 56-tab pack = £42.74. Label: 8

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

ISONIAZID

Cautions slow acetylator status (increased risk of side-effects); epilepsy; history of psychosis;

alcohol dependence, malnutrition, diabetes mellitus, HIV infection (risk of peripheral neuro-

□ ISONIAZID (continued)

tis); acute porphyria (section 9.8.2); **interactions:** Appendix 1 (isoniazid)

Hepatic impairment use with caution; monitor liver function regularly and particularly frequently in the first 2 months

Renal impairment reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; risk of peripheral neuropathy

Pregnancy not known to be harmful; see notes above

Breast-feeding monitor infant for possible toxicity; theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother and infant

Hepatic disorders Children and their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Contra-indications drug-induced liver disease

Side-effects nausea, vomiting, constipation, dry mouth; peripheral neuritis with high doses (pyridoxine prophylaxis, see notes above), optic

neuritis, convulsions, psychotic episodes, vertigo; hypersensitivity reactions including fever, erythema multiforme, purpura; blood disorders including agranulocytosis, haemolytic anaemia, aplastic anaemia; hepatitis; systemic lupus erythematosus-like syndrome, pellagra, hyperreflexia, difficulty with micturition, hyperglycaemia, and gynaecomastia reported; hearing loss and tinnitus (in children with end-stage renal impairment)

Indication and dose

Tuberculosis, used in combination with other drugs see notes above

Isoniazid (Non-proprietary) (P_M)

Tablets, isoniazid 50 mg, net price 56-tab pack = £8.34; 100 mg, 28-tab pack = £8.29. Label: 8, 22

Injection, isoniazid 25 mg/mL, net price 2-mL amp = £11.04

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

■ PYRAZINAMIDE

Cautions diabetes; **interactions:** Appendix 1 (pyrazinamide)

Hepatic disorders Children and their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Hepatic impairment monitor hepatic function—idiosyncratic hepatotoxicity more common; avoid in severe hepatic impairment

Pregnancy manufacturer advises use only if potential benefit outweighs risk; see also notes above

Breast-feeding amount too small to be harmful

Contra-indications acute porphyria (section 9.8.2)

Side-effects hepatotoxicity including fever, anorexia, hepatomegaly, splenomegaly, jaundice,

liver failure; nausea, vomiting, dysuria, arthralgia, sideroblastic anaemia, rash and occasionally photosensitivity

Licensed use not licensed

Indication and dose

Tuberculosis in combination with other drugs see notes above

Pyrazinamide (Non-proprietary) (P_M)

Tablets, scored, pyrazinamide 500 mg. Label: 8 Available from 'special-order' manufacturers or specialist importing companies, see p. 943

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

■ RIFABUTIN

Cautions see under Rifampicin; acute porphyria (section 9.8.2)

Hepatic impairment reduce dose in severe hepatic impairment

Renal impairment use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting; leucopenia, thrombocytopenia, anaemia, rarely haemolysis; raised liver enzymes, jaundice, rarely hepatitis; uveitis following high doses or administration with drugs which raise plasma concentration—see also **interactions:** Appendix 1 (rifamycins); arthralgia, myalgia, influenza-like syndrome,

dyspnoea; also hypersensitivity reactions including fever, rash, eosinophilia, bronchospasm, shock; skin, urine, saliva and other body secretions coloured orange-red; asymptomatic corneal opacities reported with long-term use

Licensed use not licensed for use in children

Indication and dose

Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count (see product literature) Also see notes above

● By mouth

Child 1–12 years 5 mg/kg (max. 300 mg) once daily

Child 12–18 years 300 mg once daily

▢ RIFABUTIN (continued)

Treatment of non-tuberculous mycobacterial disease, in combination with other drugs

- By mouth

Child 1 month–12 years 5 mg/kg once daily for up to 6 months after cultures negative

Child 12–18 years 450–600 mg once daily for up to 6 months after cultures negative

Treatment of pulmonary tuberculosis, in combination with other drugs

- By mouth

Child 12–18 years 150–450 mg once daily for at least 6 months

Mycobutin® (Pharmacia) (PoM)

Capsules, red-brown, rifabutin 150 mg. Net price 30-cap pack = £90.38. Label: 8, 14, counselling, lenses, see under Rifampicin

▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

RIFAMPICIN

Cautions liver function tests and blood counts in hepatic disorders, and on prolonged therapy, see also below; acute porphyria (section 9.8.2); **important:** advise those on hormonal contraceptives to use additional means (see also section 7.3.1); discolours soft contact lenses; see also notes above; **interactions:** Appendix 1 (rifamycins)

Note if treatment interrupted re-introduce with low dosage and increase gradually; discontinue permanently if serious side-effects develop

Hepatic disorders Children and their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Hepatic impairment impaired elimination; monitor liver function; avoid or do not exceed 8 mg/kg daily

Pregnancy manufacturers advise very high doses teratogenic in *animal* studies in 3rd trimester; risk of neonatal bleeding may be increased; see also notes above

Breast-feeding amount too small to be harmful

Contra-indications jaundice

Side-effects gastro-intestinal symptoms including anorexia, nausea, vomiting, diarrhoea (antibiotic-associated colitis reported); headache, drowsiness; those occurring mainly on intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, disseminated intravascular coagulation and acute renal failure, thrombocytopenic purpura; alterations of liver function, jaundice; flushing, urticaria, and rashes; other side-effects reported include oedema, psychoses, adrenal insufficiency, muscular weakness and myopathy, exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, pemphigoid reactions, leucopenia, eosinophilia, menstrual disturbances; urine, saliva, and other body secretions coloured orange-red; thrombophlebitis reported if infusion used for prolonged period

Licensed use not licensed for use in children for pruritus due to cholestasis

Indication and dose

Tuberculosis, in combination with other drugs
see notes above

Prophylaxis of meningococcal meningitis and Haemophilus influenzae (type b) infection Table 2, section 5.1

Brucellosis, legionnaires disease, serious staphylococcal infections, in combination with other antibacterials

- By mouth or by intravenous infusion

Neonates 5–10 mg/kg twice daily

Child 1 month–1 year 5–10 mg/kg twice daily

Child 1–18 years 10 mg/kg (max. 600 mg) twice daily

Pruritus due to cholestasis

- By mouth

Child 1 month–18 years 5–10 mg/kg (max. 600 mg) once daily

Administration Owing to risk of contact sensitisation care must be taken to avoid contact during preparation and infusion. Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with glucose 5% and 10% or sodium chloride 0.9% or Ringer's solution to a final concentration of 1.2 mg/mL; in fluid restricted patients up to 6 mg/mL may be used. Infuse over 2–3 hours.

Rifampicin (Non-proprietary) (PoM)

Capsules, rifampicin 150 mg, net price 20 = £4.17; 300 mg, 20 = £10.44. Label: 8, 14, 22, counselling, see contact lenses above

Rifadin® (Aventis Pharma) (PoM)

Capsules, rifampicin 150 mg (blue/red), net price 20 = £3.81; 300 mg (red), 20 = £7.62. Label: 8, 14, 22, counselling, see contact lenses above

Syrup, red, rifampicin 100 mg/5 mL (raspberry-flavoured). Net price 120 mL = £3.70. Label: 8, 14, 22, counselling, see contact lenses above

Excipients include sucrose

☐ RIFAMPICIN (continued)

Intravenous infusion, powder for reconstitution, rifampicin. Net price 600-mg vial (with solvent) = £7.98

Electrolytes $\text{Na}^+ < 0.5 \text{ mmol/l}$ vial

Rimactane® (Sandoz) (POM)

Capsules, rifampicin 150 mg (red), net price 60-cap pack = £11.35; 300 mg (red/brown), 60-cap pack = £22.69. Label: 8, 14, 22, counselling, see contact lenses above

▲ Combined preparations

See notes above

Rifater® (Aventis Pharma) (POM)

Tablets, pink, s/c, rifampicin 120 mg, isoniazid 50 mg, pyrazinamide 300 mg. Net price 20 = £4.39. Label: 8, 14, 22, counselling, see contact lenses above

Rifinah 150® (Aventis Pharma) (POM)

Tablets, pink, s/c, rifampicin 150 mg, isoniazid 100 mg, net price 84-tab pack = £16.55. Label: 8, 14, 22, counselling, see contact lenses above

Rifinah 300® (Aventis Pharma) (POM)

Tablets, orange, s/c, rifampicin 300 mg, isoniazid 150 mg, net price 56-tab pack = £21.87. Label: 8, 14, 22, counselling, see contact lenses above

STREPTOMYCIN

Cautions see under Aminoglycosides, section 5.1.4; measure plasma-concentration in renal impairment; **Interactions:** Appendix 1 (aminoglycosides)

Contra-indications see under Aminoglycosides, section 5.1.4

Side-effects see under Aminoglycosides, section 5.1.4; also hypersensitivity reactions, paraesthesia of mouth

Pharmacokinetics one-hour ('peak') concentration should be 15–40 mg/litre; pre-dose ('trough') concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment)

Licensed use not licensed for use in children

Indication and dose

Tuberculosis, resistant to other treatment, in combination with other drugs

- By deep intramuscular injection

Child 1 month–18 years 15 mg/kg (max. 1 g) once daily

Adjunct to doxycycline in brucellosis, expert advice essential

- By deep intramuscular injection

Child 1 month–18 years 5–10 mg/kg every 6 hours; total daily dose may alternatively be given in 2–3 divided doses

Streptomycin Sulphate (Non-proprietary) (POM)

Injection, powder for reconstitution, streptomycin (as sulphate), net price 1-g vial = £8.25

Available as an unlicensed preparation from UCB Pharma

5.1.10 Antileprotic drugs

Classification not used in *BNF for Children*.

5.1.11 Metronidazole

Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa. It is also used for surgical and gynaecological sepsis in which its activity against colonic anaerobes, especially *Bacteroides fragilis*, is important. Metronidazole by mouth is effective for the treatment of *Clostridium difficile* infection (see also section 1.5); it can be given by intravenous infusion if oral treatment is inappropriate. Metronidazole is well absorbed orally and the intravenous route is normally reserved for severe infections. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible. Intravenous metronidazole is used for the treatment of established cases of tetanus; diazepam (section 10.2.2) and tetanus immunoglobulin (section 14.5) are also used.

Topical metronidazole (section 13.10.1.2) reduces the odour produced by anaerobic bacteria in fungating tumours; it is also used in the management of rosacea (section 13.6).

Oral infections Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes (Table 1, section 5.1). It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent's infection) and pericoronitis; suitable alternatives are amoxicillin (section 5.1.1.3) and erythromycin (section 5.1.5). For these purposes treatment with metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer

in pericoronitis. Tinidazole is licensed for the treatment of acute ulcerative gingivitis.

METRONIDAZOLE

Cautions disulfiram-like reaction with alcohol, clinical and laboratory monitoring advised if treatment exceeds 10 days; **interactions:** Appendix 1 (metronidazole)

Hepatic impairment in severe liver disease reduce total daily dose to one-third, and give once daily; use with caution in hepatic encephalopathy

Pregnancy manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk

Breast-feeding significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste

Side-effects gastro-intestinal disturbances (including nausea and vomiting), taste disturbances, furred tongue, oral mucositis, anorexia; *very rarely* hepatitis, jaundice, pancreatitis, drowsiness, dizziness, headache, ataxia, psychotic disorders, darkening of urine, thrombocytopenia, pancytopenia, myalgia, arthralgia, visual disturbances, rash, pruritus, and erythema multiforme; on prolonged or intensive therapy peripheral neuropathy, prolonged epileptiform seizures, and leucopenia

Licensed use not licensed for use in neonates or children under 1 year

Indication and dose

Protozoal infections section 5.4.2

Anaerobic infections (usually treated for 7 days and for 7–10 days in *Clostridium difficile* infection)

• By mouth

Neonate initially 15 mg/kg then 7.5 mg/kg twice daily

Child 1 month–12 years 7.5 mg/kg (max. 400 mg) every 8 hours

Child 12–18 years 400 mg every 8 hours

• By rectum

Child 1 month–1 year 125 mg 3 times daily for 3 days, then twice daily thereafter

Child 1–5 years 250 mg 3 times daily for 3 days, then twice daily thereafter

Child 5–12 years 500 mg 3 times daily, for 3 days, then twice daily thereafter

Child 12–18 years 1 g 3 times daily for 3 days, then twice daily thereafter

• By intravenous infusion over 20–30 minutes

Neonate 15 mg/kg as a single loading dose, followed after 24 hours by 7.5 mg/kg every 12 hours thereafter

Child 1 month–18 years 7.5 mg/kg (max. 500 mg) every 8 hours

Pelvic inflammatory disease (see also Table 1, section 5.1)

• By mouth

Child 12–18 years 400 mg twice daily for 14 days

Acute ulcerative gingivitis and other acute dental infections

• By mouth

Child 1–3 years 50 mg every 8 hours

Child 3–7 years 100 mg every 12 hours

Child 7–10 years 100 mg every 8 hours

Child 10–18 years 200 mg every 8 hours

***Helicobacter pylori* eradication** section 1.3

Surgical prophylaxis

• By mouth or by intravenous infusion

Child 1 month–12 years 7.5 mg/kg 2 hours before surgery; up to 3 further doses of 7.5 mg/kg may be given every 8 hours for high-risk procedures

Child 12–18 years 400–500 mg 2 hours before surgery; up to 3 further doses of 400–500 mg may be given every 8 hours for high-risk procedures

• By rectum

Child 5–10 years 500 mg 2 hours before surgery; up to 3 further doses of 500 mg may be given every 8 hours for high-risk procedures

Child 10–18 years 1 g 2 hours before surgery; up to 3 further doses of 1 g may be given every 8 hours for high-risk procedures

Note Metronidazole doses in BNF for Children may differ from those in product literature

Metronidazole (Non-proprietary) (POM)

Tablets, metronidazole 200 mg, net price 21-tab pack = £1.10; 400 mg, 21-tab pack = £1.29. Label: 4, 9, 21, 25, 27

Brands include *Vaginyl*[®]

Tablets, metronidazole 500 mg, net price 21-tab pack = £26.79. Label: 4, 9, 21, 25, 27

Suspension, metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £9.07. Label: 4, 9, 23
Brands include *Norzo*[®]

Intravenous infusion, metronidazole 5 mg/mL. Net price 20-mL amp = £1.56, 100-mL container = £3.41

Dental prescribing on NHS Metronidazole Tablets and Oral Suspension may be prescribed

Flagyl[®] (Winthrop) (POM)

Tablets, both f/c, ivory, metronidazole 200 mg, net price 21-tab pack = £4.67; 400 mg, 14-tab pack = £6.60. Label: 4, 9, 21, 25, 27

Suppositories, metronidazole 500 mg, net price 10 = £15.80; 1 g, 10 = £24.00. Label: 4, 9

▢ METRONIDAZOLE (continued)

Flagyl S[®] (Winthrop) (PMM)

Suspension, orange- and lemon-flavoured, metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £11.63. Label: 4, 9, 23

Metrolyl[®] (Sandoz) (PMM)

Intravenous infusion, metronidazole 5 mg/mL, net price 100-mL Steriflex[®] bag = £1.22
Electrolytes Na⁺ 14.53 mmol/100-mL bag

Suppositories, metronidazole 500 mg, net price 10 = £12.34; 1 g, 10 = £18.34. Label: 4, 9

5.1.12 Quinolones

Nalidixic acid is effective in uncomplicated urinary-tract infections.

Ciprofloxacin is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin is licensed in children over 1 year of age for pseudomonal infections in cystic fibrosis, for complicated urinary-tract infections, and for treatment and prophylaxis of inhalation anthrax. When the benefits of treatment outweigh the risks, ciprofloxacin is licensed in children over 1 year of age for severe infections of the respiratory tract and of the gastro-intestinal system (including typhoid fever). It is also used in the treatment of septicaemia caused by multi-resistant organisms (usually hospital acquired) and gonorrhoea (although resistance is increasing). Ciprofloxacin is also used in the prophylaxis of meningococcal disease.

Many staphylococci are resistant to quinolones and their use should be avoided in MRSA infections.

Ofloxacin eye drops are used in ophthalmic infections (section 11.3.1).

There is much less experience of the other quinolones in children; expert advice should be sought.

Anthrax *Inhalation* or *gastro-intestinal anthrax* should be treated initially with either **ciprofloxacin** or, in children over 12 years, **doxycycline** [unlicensed indication] (section 5.1.3) combined with one or two other antibacterials (such as amoxicillin, benzylpenicillin, chloramphenicol, clarithromycin, clindamycin, imipenem with cilastatin, rifampicin [unlicensed indication], and vancomycin). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] (section 5.1.3) for 7 days. Treatment may be switched to amoxicillin (section 5.1.1.3) if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax (section 14.4) may allow the duration of antibacterial prophylaxis to be shortened.

Cautions Quinolones should be used with caution in children with a history of epilepsy or conditions that predispose to seizures, in G6PD deficiency (section 9.1.5), myasthenia gravis (risk of exacerbation). Exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs). The CSM has warned that quinolones may induce **convulsions** in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them. Other **interactions**: Appendix 1 (quinolones).

Quinolones cause arthropathy in the weight-bearing joints of immature *animals* and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of a quinolone in children is justified. **Nalidixic acid** is used for resistant urinary-tract infections in children over 3 months of age.

Tendon damage

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- kidney, heart, or lung transplant recipients are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

Side-effects Side-effects of the quinolones include nausea, vomiting, dyspepsia, abdominal pain, diarrhoea (rarely antibiotic-associated colitis), headache, dizziness, rash (very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis). Less frequent side-effects include anorexia, sleep disturbances, asthenia, confusion, anxiety, depression, hallucinations, tremor, blood disorders (including eosinophilia, leucopenia, thrombocytopenia), arthralgia, myalgia, disturbances in vision and taste. Other side-effects reported rarely or very rarely include hepatic dysfunction (including jaundice and hepatitis), hypotension, vasculitis, dyspnoea, convulsions, psychoses, paraesthesia, renal failure, interstitial nephritis, tendon inflammation and damage (see also Tendon Damage above), photosensitivity, disturbances in hearing and smell. The drug should be **discontinued** if psychiatric, neurological or hypersensitivity reactions (including severe rash) occur.

CIPROFLOXACIN

Cautions see notes above; avoid excessive alkalinity of urine and ensure adequate fluid intake (risk of crystalluria); **interactions:** Appendix 1 (quinolones)

Skilled tasks May impair performance of skilled tasks (e.g. driving)

Renal impairment reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—consult product literature

Breast-feeding amount probably too small to be harmful but manufacturer advises avoid

Contra-indications

Pregnancy avoid—arthropathy in *animal* studies; safer alternatives available

Side-effects see notes above; also flatulence, pain and phlebitis at injection site; *rarely* dysphagia, pancreatitis, chest pain, tachycardia, syncope, oedema, hot flushes, abnormal dreams, sweating, hyperglycaemia, and erythema nodosum; *very rarely* movement disorders, tinnitus, vasculitis, and tenosynovitis

Licensed use licensed for use in children over 1 year for complicated urinary-tract infections, for pseudomonas lower respiratory-tract infections in cystic fibrosis, for prophylaxis and treatment of inhalational anthrax; licensed for use in children over 1 year for other infections where the benefit is considered to outweigh the potential risks; not

licensed for use in children for gastro-intestinal anthrax; not licensed for use in children for prophylaxis of meningococcal meningitis; not licensed for use in children under 1 year of age

Indication and dose

Complicated urinary-tract infections

- By mouth

Neonate 7.5 mg/kg twice daily

Child 1 month–1 year 5–7.5 mg/kg twice daily; dose doubled in severe infection

Child 1–18 years 10 mg/kg twice daily; dose doubled in severe infection (max. 750 mg twice daily)

- By intravenous infusion over 60 minutes

Neonate 5 mg/kg every 12 hours

Child 1 month–1 year 4 mg/kg every 12 hours; dose doubled in severe infection

Child 1–18 years 6 mg/kg every 8 hours; increased to 10 mg/kg every 8 hours in severe infection (max. 400 mg every 8 hours)

◊ CIPROFLOXACIN (continued)

Severe respiratory-tract infections, gastro-intestinal infections; see notes above

- By mouth

Neonate 7.5 mg/kg twice daily

Child 1 month–1 year 5–7.5 mg/kg twice daily; dose doubled in severe infection

Child 1–18 years 20 mg/kg (max. 750 mg) twice daily

- By intravenous infusion over 60 minutes

Neonate 5 mg/kg every 12 hours

Child 1 month–1 year 4 mg/kg every 12 hours; dose doubled in severe infection

Child 1–18 years 10 mg/kg (max. 400 mg) every 8 hours

Pseudomonal lower respiratory-tract infection in cystic fibrosis

- By mouth

Child 1 month–1 year 15 mg/kg twice daily

Child 1–18 years 20 mg/kg (max. 750 mg) twice daily

- By intravenous infusion over 60 minutes

Child 1 month–1 year 4–8 mg/kg every 12 hours

Child 1–18 years 10 mg/kg (max. 400 mg) every 8 hours

Genorrhoea

- By mouth

Child 12–18 years 500 mg as a single dose

Anthrax (treatment and post-exposure prophylaxis, see notes above)

- By mouth

Child 1 month–18 years 15 mg/kg (max. 500 mg) twice daily

- By intravenous infusion over 60 minutes

Child 1 month–18 years 10 mg/kg (max. 400 mg) every 12 hours

Eye infections section 11.3.1

Prophylaxis of meningococcal meningitis Table 2, section 5.1

Ciprofloxacin (Non-proprietary) (POM)

Tablets, ciprofloxacin (as hydrochloride) 100 mg, net price 6-tab pack = £1.08; 250 mg, 10-tab pack = £1.12, 20-tab pack = £1.17; 500 mg, 10-tab pack = £1.19, 20-tab pack = £1.19; 750 mg, 10-tab pack = £1.99. Label: 7, 9, 25, counselling, driving

Intravenous infusion, ciprofloxacin (as lactate) 2 mg/mL, net price 50-mL bottle = £8.00, 100-mL bottle = £15.00, 200-mL bottle = £22.00

Ciproxin® (Bayer) (POM)

Tablets, all f/c, ciprofloxacin (as hydrochloride) 250 mg (scored), net price 10-tab pack = £7.50, 20-tab pack = £15.00; 500 mg (scored), 10-tab pack = £14.20, 20-tab pack = £28.40; 750 mg, 10-tab pack = £20.00. Label: 7, 9, 25, counselling, driving

Suspension, strawberry-flavoured, ciprofloxacin for reconstitution with diluent provided, 250 mg/5 mL, net price 100 mL = £16.50. Label: 7, 9, 25, counselling, driving

Intravenous infusion, ciprofloxacin (as lactate) 2 mg/mL, in sodium chloride 0.9%, net price 50-mL bottle = £8.65, 100-mL bottle = £16.89, 200-mL bottle = £25.70

Electrolytes Na⁺ 15.4 mmol/100-mL bottle

NALIDIXIC ACID

Cautions see notes above; avoid in acute porphyria (section 9.8.2); false positive urinary glucose (if tested for reducing substances); monitor blood counts, renal and liver function if treatment exceeds 2 weeks; **interactions**: Appendix 1 (quinolones)

Hepatic impairment manufacturer advises caution in liver disease

Renal impairment use with caution; avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m²

Breast-feeding risk to infant very small but one case of haemolytic anaemia reported

Contra-indications

Pregnancy avoid—arthropathy in *animal* studies; safer alternatives available

Side-effects see notes above; also reported toxic psychosis, increased intracranial pressure, cranial nerve palsy, metabolic acidosis

Licensed use not licensed for use in children under 3 months of age

Indication and dose

Urinary tract infection resistant to other anti-biotics

- By mouth

Child 3 months–12 years 12.5 mg/kg 4 times daily for 7 days, reduced to 7.5 mg/kg 4 times daily in prolonged therapy or 15 mg/kg twice daily for prophylaxis

Child 12–18 years 900 mg 4 times daily for 7 days, reduced in chronic infections to 600 mg 4 times daily

Uriben® (Rosemont) (POM)

Suspension, pink, nalidixic acid 300 mg/5 mL, net price 150 mL (raspberry- and strawberry-flavoured) = £11.42. Label: 9, 11

Excipients include sucrose 450 mg/5mL

5.1.13 Urinary-tract infections

Urinary-tract infection is more common in adolescent girls than in boys; when it occurs in adolescent boys there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

Escherichia coli is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include *Proteus* and *Klebsiella* spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

Whenever possible a specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated 'lower' urinary-tract infections in children over 3 months of age can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin, or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav for 7–10 days. If the patient is severely ill, then the infection is best treated initially by intravenous injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Children under 3 months of age should be transferred to hospital and treated initially with intravenous antibacterials such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Resistant infections Widespread bacterial resistance, especially to amoxicillin, ampicillin, and trimethoprim has increased the importance of urine culture before therapy. Alternatives for resistant organisms include co-amoxiclav (amoxicillin with clavulanic acid), an oral cephalosporin, pivmecillinam, or a quinolone.

Antibacterial prophylaxis Recurrent episodes of infection are an indication for imaging tests. *Antibacterial prophylaxis* with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage. Nitrofurantoin is contraindicated in children under 3 months of age because of the theoretical possibility of haemolytic anaemia.

Pregnancy Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulphonamides, quinolones, and tetracyclines should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

Renal impairment In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methamine, and nitrofurantoin should be avoided altogether.

NITROFURANTOIN

Cautions anaemia; diabetes mellitus; electrolyte imbalance; vitamin B and folate deficiency; pulmonary disease; monitor lung and liver function on long-term therapy (discontinue if deterioration in lung function); susceptibility to peripheral neuropathy; false positive urinary glucose (if tested for reducing substances); urine may be

coloured yellow or brown; **interactions:** Appendix 1 (nitrofurantoin)

Hepatic impairment cholestatic jaundice and chronic active hepatitis reported

Pregnancy may produce neonatal haemolysis if used at term

▢ NITROFURANTOIN (continued)

Contra-indications infants less than 3 months old, G6PD deficiency, acute porphyria (section 9.8.2)

Renal impairment avoid if estimated glomerular filtration rate less than 60 mL/minute/1.73 m²; risk of peripheral neuropathy; ineffective because of inadequate urine concentrations

Breast-feeding avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants (section 9.1.5)

Side-effects anorexia, nausea, vomiting, and diarrhoea; acute and chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome); rarely, cholestatic jaundice, hepatitis, exfoliative dermatitis, erythema multiforme, pancreatitis, arthralgia, blood disorders (including agranulocytosis, thrombocytopenia, and aplastic anaemia), benign intracranial hypertension, and transient alopecia

Indication and dose

Acute uncomplicated urinary tract infection

• By mouth

Child 3 months–12 years 750 micrograms/kg 4 times daily for 3–7 days

Child 12–18 years 50 mg 4 times daily for 3–7 days; increased to 100 mg 4 times daily in severe chronic recurrent infections

Prophylaxis of urinary tract infection (but see Cautions)

• By mouth

Child 3 months–12 years 1 mg/kg at night

Child 12–18 years 50–100 mg at night

Nitrofurantoin (Non-proprietary) (POM)

Tablets, nitrofurantoin 50 mg, net price 28-tab pack = £1.84; 100 mg, 28-tab pack = £4.32 Label: 9, 14, 21

Oral suspension, nitrofurantoin 25 mg/5 mL, net price 300 mL = £65.00. Label: 9, 14, 21

Furadantin® (Goldshield) (POM)

Tablets, all yellow, scored, nitrofurantoin 50 mg, net price 20 = £1.96; 100 mg, 20 = £3.62. Label: 9, 14, 21

Macrobid® (Goldshield) (POM)

Capsules, m/r, blue/yellow, nitrofurantoin 100 mg (as nitrofurantoin macrocrystals and nitrofurantoin monohydrate). Net price 14-cap pack = £4.89. Label: 9, 14, 21, 25

Dose

Uncomplicated urinary-tract infection

Child 12–18 years 1 capsule twice daily with food

Genito-urinary surgical prophylaxis

Child 12–18 years 1 capsule twice daily on day of procedure and for 3 days after

Macrochantin® (Goldshield) (POM)

Capsules, nitrofurantoin 50 mg (yellow/white), net price 30-cap pack = £3.05; 100 mg (yellow/white), 20 = £3.84. Label: 9, 14, 21

5.2 Antifungal drugs

Treatment of fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. For local treatment of fungal infections, see section 7.2.2 (genital), section 7.4.4 (bladder), section 11.3.2 (eye), section 12.1.1 (ear), section 12.3.2 (oropharynx), and section 13.10.2 (skin).

Aspergillosis Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the sinuses, heart, brain, and skin. **Amphotericin** (liposomal formulation preferred if toxicity or renal impairment are concerns) or **voriconazole** can be used to treat aspergillosis. **Itraconazole** is an alternative for refractory infection or for patients who cannot tolerate amphotericin. Itraconazole is also used as an adjunct in the treatment of allergic bronchopulmonary aspergillosis. **Caspofungin** is licensed in children for invasive aspergillosis unresponsive to amphotericin or to itraconazole, or in children who cannot tolerate amphotericin or itraconazole; information on use in children is limited.

Candidiasis Many superficial candidal infections, including infections of the skin (section 13.10.2), are treated locally. Systemic antifungal treatment is required in widespread or intractable infection. Vaginal candidiasis can be treated

with locally acting antifungals (section 7.2.2); alternatively, fluconazole can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy (section 12.3.2). Fluconazole is given by mouth for unresponsive infections; it is reliably absorbed and is effective. Itraconazole can be used for fluconazole-resistant infections. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

For *deep and disseminated candidiasis*, **amphotericin** can be given by intravenous infusion. **Fluconazole** is an alternative for *Candida albicans* infection in clinically stable children who have not received an azole antifungal recently. **Caspofungin** or **voriconazole** can be used for infections caused by fluconazole-resistant *Candida* spp. that have not responded to amphotericin, or in children intolerant of amphotericin. In refractory cases, **flucytosine** can be used with amphotericin.

Cryptococcosis Cryptococcosis is uncommon but infection in the immunocompromised, especially HIV-infected children, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is **amphotericin** by intravenous infusion with **flucytosine** by intravenous infusion for 2 weeks, followed by **fluconazole** by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in AIDS patients with mild localised infection or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected children. **Itraconazole** can be used for the treatment of immunocompetent children with indolent non-meningeal infection including chronic pulmonary histoplasmosis. **Amphotericin** by intravenous infusion is preferred in children with fulminant or severe infections. Following successful treatment, itraconazole can be used for prophylaxis against relapse.

Skin and nail infections Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy (section 13.10.2). Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis).

Oral imidazole or triazole antifungals (particularly **itraconazole**) and **terbinafine** are used more frequently than griseofulvin because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal (section 13.10.2) may reduce transmission. **Griseofulvin** is used for tinea capitis; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. Terbinafine is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain.

Pityriasis versicolor (section 13.10.2) may be treated with **itraconazole** by mouth if topical therapy is ineffective; **fluconazole** by mouth is an alternative. Oral **terbinafine** is not effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic children with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. **Terbinafine** and **itraconazole** have largely replaced griseofulvin for the systemic treatment of *onychomycosis*, particularly of the toenail; they should be used under specialist advice. Although terbinafine is not licensed for use in children, it is considered to be the drug of choice for onychomycosis. Itraconazole can be administered as intermittent 'pulse' therapy. For the role of topical antifungals in the treatment of onychomycosis, see section 13.10.2.

Immunocompromised children Immunocompromised children are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral imidazole or triazole antifungals are the drugs of choice for prophylaxis. **Fluconazole** is more reliably absorbed than itraconazole and ketoconazole and is considered less toxic than ketoconazole for long-term use.

Amphotericin by intravenous infusion is used for the empirical treatment of serious fungal infections. Fluconazole is used for treatment of *Candida albicans* infection.

Caspofungin is licensed for the empirical treatment of systemic fungal infections (such as those involving *Candida* spp. or *Aspergillus* spp.) in children with neutropenia.

Drugs used in fungal infections

Polyene antifungals The polyene antifungals include amphotericin and nystatin; neither drug is absorbed when given by mouth. They are used for oral, oropharyngeal, and perioral infections by local application in the mouth (section 12.3.2).

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet*[®], *Ambisome*[®], and *Amphocil*[®]) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity, or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Nystatin is used principally for *Candida albicans* infections of the skin (section 13.10.2) and mucous membranes, including oesophageal and intestinal candidiasis.

Imidazole antifungals The imidazole antifungals include clotrimazole, econazole, sulconazole, and tioconazole. They are used for the local treatment of vaginal candidiasis (section 7.2.2) and for dermatophyte infections (section 13.10.2).

Ketoconazole is better absorbed by mouth than other imidazoles. It has been associated with fatal hepatotoxicity; the CSM has advised that prescribers should weigh the potential benefits of ketoconazole treatment against the risk of liver damage and should carefully monitor patients both clinically and biochemically. It should not be used by mouth for superficial fungal infections.

Miconazole (section 12.3.2) can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

Triazole antifungals **Fluconazole** is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis.

Itraconazole is active against a wide range of dermatophytes. There is limited information available on use in children. Itraconazole capsules require an acid environment in the stomach for optimal absorption.

Itraconazole has been associated with liver damage and should be avoided or used with caution in children with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Voriconazole is a broad-spectrum antifungal drug which is licensed in adults for the treatment of life-threatening infections.

Echinocandin antifungals **Caspofungin** is active against *Aspergillus* spp. and *Candida* spp. It is given by intravenous infusion for invasive infection resistant to other antifungals. **Micafungin** is licensed for the treatment of candidiasis.

Other antifungals **Flucytosine** is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in children with AIDS; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment.

Griseofulvin is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. Griseofulvin is used in the treatment of tinea capitis. It is the drug of choice for

trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

AMPHOTERICIN

(Amphotericin B)

Cautions when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose; see Anaphylaxis below); hepatic and renal function tests, blood counts and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required; corticosteroids (avoid except to control reactions); avoid rapid infusion (risk of arrhythmias); **interactions:** Appendix 1 (amphotericin)

Renal impairment use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation

Pregnancy not known to be harmful, but manufacturers advise avoid unless potential benefit outweighs risk

Anaphylaxis The CSM has advised that anaphylaxis occurs rarely with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential)

Side-effects when given parenterally, anorexia, nausea and vomiting, diarrhoea, epigastric pain; febrile reactions, headache, muscle and joint pain; anaemia; disturbances in renal function (including hypokalaemia and hypomagnesaemia) and renal toxicity; also cardiovascular toxicity (including arrhythmias, blood pressure changes), blood disorders, neurological disorders (including hearing loss, diplopia, convulsions, peripheral neuropathy, encephalopathy), abnormal liver function (discontinue treatment), rash, anaphylactoid reactions (see Anaphylaxis, above); pain and thrombophlebitis at injection site

Licensed use intravenous conventional formulation amphotericin (*Fungizone*[®]) is licensed for use in children (age range not specified by manufacturer); lipid formulations (*Abelcet*[®], *Amphocil*[®]) are licensed for use in children (age range not specified by manufacturers); *Ambisome*[®] not licensed for use in children under 1 month

Indication and dose

Oral and peroral infections section 12.3.2

Systemic fungal infections

- By intravenous infusion see preparations

Note Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should **not** be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

Fungizone[®] (Squibb) (POM)

Intravenous infusion, powder for reconstitution, amphotericin (as sodium deoxycholate complex), net price 50-mg vial = £4.12

Electrolytes Na⁺ < 0.5 mmol/vial

Dose

Systemic fungal infection

- By intravenous infusion

Neonate initial test dose of 100 micrograms/kg included as part of first dose of 1 mg/kg, then 1 mg/kg once daily (after 7 days, may be reduced to 1 mg/kg on alternate days)

Child 1 month–18 years initial test dose of 100 micrograms/kg (max. 1 mg) included as part of first dose of 250 micrograms/kg daily; increased over 2–4 days, if tolerated, to 1 mg/kg daily; in severe infection max. 1.5 mg/kg daily or on alternate days

Note prolonged treatment usually necessary; if interrupted for longer than 7 days, recommence at 250 micrograms/kg daily and increase gradually

Administration For *intravenous infusion*, reconstitute each vial with 10 mL Water for Injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in Glucose 5% to a concentration of 100 micrograms/mL (in fluid-restricted children, up to 400 micrograms/mL given via a central line); pH of glucose solution must not be below 4.2 (check each container—consult product literature for details of buffer); infuse over 4–6 hours, or if tolerated over a minimum of 2 hours (initial test dose given over 20–30 minutes); begin infusion immediately after dilution and protect from light; incompatible with Sodium Chloride solutions—flush existing intravenous line with Glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used

Lipid formulations

Abelcet[®] (Cephalon) (POM)

Intravenous infusion, amphotericin 5 mg/mL as lipid complex with L- α -dimyristoylphosphatidylcholine and L- α -dimyristoylphosphatidylglycerol, net price 20-mL vial = £82.13 (hosp. only)

Dose

Severe invasive candidiasis; severe systemic fungal infections in children not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in children with HIV

- By intravenous infusion

Child 1 month–18 years initial test dose of 100 micrograms/kg (max. 1 mg) then 5 mg/kg once daily

Administration for *intravenous infusion*, allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute in Glucose 5% to a concentration of 2 mg/mL; preferably give *via* an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions—flush existing intravenous line with Glucose 5% or use separate line

▢ AMPHOTERICIN (continued)

AmBisome® (Gilead) (PoM)

Intravenous infusion, powder for reconstitution, amphotericin 50 mg encapsulated in liposomes, net price 50-mg vial = £96.69

Electrolytes $\text{Na}^+ < 0.5 \text{ mmol/vial}$

Excipients include sucrose 900 mg/vial

Dose

Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin

- By intravenous infusion

Neonate initial test dose 100 micrograms/kg then 1 mg/kg once daily, increased if necessary to 3 mg/kg once daily; max. 5 mg/kg once daily

Child 1 month–18 years initial test dose 100 micrograms/kg (max. 1 mg) then 1 mg/kg once daily, increased if necessary in steps of 1 mg/kg daily to 3 mg/kg once daily; max. 5 mg/kg once daily

Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

- By intravenous infusion

Child 1 month–18 years initial test dose 100 micrograms/kg (max. 1 mg) then 3 mg/kg once daily until afebrile for 3 consecutive days; max. period of treatment 42 days; max. 5 mg/kg once daily

Visceral leishmaniasis see section 5.4.5 and product literature

Administration for intravenous infusion, reconstitute each vial with 12 mL Water for Injections and shake vigorously

to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into Glucose 5% through the 5-micron filter provided, to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes (initial test dose given over 10 minutes); incompatible with sodium chloride solutions—flush existing intravenous line with Glucose 5% or use separate line

Amphocil® (Beacon) (PoM)

Intravenous infusion, powder for reconstitution, amphotericin as a complex with sodium cholesteryl sulphate, net price 50-mg vial = £104.10, 100-mg vial = £190.05

Electrolytes $\text{Na}^+ < 0.5 \text{ mmol/vial}$

Dose

Severe systemic or deep mycoses where toxicity or renal failure precludes use of conventional amphotericin

- By intravenous infusion

Child 1 month–18 years initial test dose 100 micrograms/kg (max. 2 mg) then 30 minutes later 1 mg/kg once daily, increased gradually if necessary to 3–4 mg/kg once daily; max. 6 mg/kg daily

Administration for intravenous infusion, initially reconstitute with Water for Injections (50 mg in 10 mL, 100 mg in 20 mL) shaking gently to dissolve (fluid may be opalescent) then dilute to a concentration of 625 micrograms/mL with Glucose 5% (1 volume of reconstituted solution with 7 volumes of infusion fluid); give at a rate of 1–2 mg/kg/hour or slower if not tolerated (for initial test dose use a 100 microgram/mL solution and give over 10 minutes); incompatible with sodium chloride or other electrolyte solutions, flush existing intravenous line with Glucose 5% or use separate line

CASPOFUNGIN

Cautions interactions: Appendix 1 (casposfungin)

Hepatic impairment usual initial dose, then use 70% of normal maintenance dose in moderate hepatic impairment; no information available for severe hepatic impairment

Pregnancy manufacturer advises avoid unless essential—toxicity in animal studies

Contra-indications

Breast-feeding present in milk in animal studies—manufacturer advises avoid

Side-effects nausea, vomiting, abdominal pain, diarrhoea; tachycardia, flushing, hypotension; dyspnoea; fever, headache; anaemia, decrease in serum potassium, hypomagnesaemia; rash, pruritus, sweating; injection-site reactions; also reported, hepatic dysfunction, oedema, acute respiratory distress syndrome, hypersensitivity reactions (including anaphylaxis), and hypercalcaemia

Indication and dose

Invasive aspergillosis either unresponsive to amphotericin or itraconazole or in patients intolerant of amphotericin or itraconazole; invasive candidiasis (see notes above); empirical treatment of systemic fungal infections in patients with neutropenia

- By intravenous infusion

Child 1–18 years 70 mg/m² (max. 70 mg) on first day then 50 mg/m² (max. 70 mg) once daily; increased to 70 mg/m² (max. 70 mg) daily if lower dose tolerated but inadequate response

Administration for intravenous infusion, allow vial to reach room temperature; initially reconstitute 50 mg with 10.5 mL Water for Injections to produce a 5.2 mg/mL solution, or reconstitute 70 mg with 10.5 mL Water for Injections to produce a 7.2 mg/mL solution; mix gently to dissolve; dilute requisite dose to a final concentration not exceeding 500 micrograms/mL with Sodium Chloride 0.9% or Compound Sodium Lactate; give over 60 minutes; incompatible with glucose solutions

Cancidas® (MSD) ▼ (PoM)

Intravenous infusion, powder for reconstitution, casposfungin (as acetate), net price 50-mg vial = £327.67; 70-mg vial = £416.78

FLUCONAZOLE

Cautions concomitant use with hepatotoxic drugs, monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis); susceptibility to QT interval prolongation; **interactions:** Appendix 1 (antifungals, triazole)

Hepatic impairment toxicity with related drugs

Renal impairment usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73m²

Pregnancy manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses

Breast-feeding present in milk but amount probably too small to be harmful

Contra-indications acute porphyria (section 9.8.2)

Side-effects nausea, abdominal discomfort, diarrhoea, flatulence, headache, rash (discontinue treatment or monitor closely if infection invasive or systemic); less frequently dyspepsia, vomiting, taste disturbance, hepatic disorders, angioedema, anaphylaxis, dizziness, seizures, alopecia, pruritus, toxic epidermal necrolysis, Stevens-Johnson syndrome (severe cutaneous reactions more likely in AIDS patients), hyperlipidaemia, leucopenia, thrombocytopenia, and hypokalaemia reported

Licensed use not licensed for tinea infections in children, or for vaginal candidiasis in girls under 16 years, or for prevention of relapse of cryptococcal meningitis after completion of primary therapy in children with AIDS

Indication and dose**Mucosal candidiasis (except genital)**

• By mouth or by intravenous infusion

Neonate under 2 weeks 3–6 mg/kg on first day then 3 mg/kg every 72 hours

Neonate 2–4 weeks 3–6 mg/kg on first day then 3 mg/kg every 48 hours

Child 1 month–12 years 3–6 mg/kg on first day then 3 mg/kg (max. 100 mg) daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)

Child 12–18 years 50 mg daily (100 mg daily in unusually difficult infections) given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)

Vaginal candidiasis (see also Recurrent Vulvovaginal Candidiasis, section 7.2.2)

• By mouth

Child under 16 years (post-puberty) a single dose of 150 mg

Child 16–18 years a single dose of 150 mg

Candidal balanitis

• By mouth

Child 16–18 years a single dose of 150 mg

Tinea pedis, corporis, cruris, pityriasis versicolor, and dermal candidiasis

• By mouth

Child 1 month–18 years 3 mg/kg (max. 50 mg) daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)

• By mouth or by intravenous infusion

Neonate under 2 weeks 6–12 mg/kg every 72 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis)

Neonate 2–4 weeks 6–12 mg/kg every 48 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis)

Child 1 month–18 years 6–12 mg/kg (max. 800 mg) daily, treatment continued according to response (at least 8 weeks for cryptococcal meningitis)

Prevention of relapse of cryptococcal meningitis in AIDS patients after completion of primary therapy

• By mouth or by intravenous infusion

Child 1 month–18 years 6 mg/kg (max. 200 mg) daily

Prevention of fungal infections in immunocompromised patients

• By mouth or by intravenous infusion

Neonate under 2 weeks according to extent and duration of neutropenia, 3–12 mg/kg every 72 hours

Neonate 2–4 weeks according to extent and duration of neutropenia, 3–12 mg/kg every 48 hours

Child 1 month–18 years according to extent and duration of neutropenia, 3–12 mg/kg (max. 400 mg) daily; 12 mg/kg (max. 400 mg) daily if high risk of systemic infections e.g. following bone-marrow transplantation; commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

Administration for intravenous infusion, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute

◁ FLUCONAZOLE (continued)

Fluconazole (Non-proprietary) (P_M)

¹ **Capsules**, fluconazole 50 mg, net price 7-cap pack = 98p; 150 mg, single-capsule pack = 91p; 200 mg, 7-cap pack = £2.02. Label: 9, (50 and 200 mg)
Dental prescribing on NHS Fluconazole Capsules 50 mg may be prescribed

Intravenous infusion, fluconazole 2 mg/mL, net price 25-mL bottle = £7.32; 100-mL bottle = £29.28

Diflucan® (Pfizer) (P_M)

¹ **Capsules**, fluconazole 50 mg (blue/white), net price 7-cap pack = £16.61; 150 mg (blue), single-

capsule pack = £7.12; 200 mg (purple/white), 7-cap pack = £66.42. Label: 9, (50 and 200 mg)

Oral suspension, orange-flavoured, fluconazole for reconstitution with water, 50 mg/5 mL, net price 35 mL = £16.61; 200 mg/5 mL, 35 mL = £66.42. Label: 9

Dental prescribing on NHS May be prescribed as Fluconazole Oral Suspension 50 mg/5 mL

Intravenous infusion, fluconazole 2 mg/mL in sodium chloride intravenous infusion 0.9%, net price 25-mL bottle = £7.32; 100-mL bottle = £29.28
Electrolytes Na⁺ 15 mmol/100-mL bottle

FLUCYTOSINE

Cautions blood disorders; liver- and kidney-function tests and blood counts required (weekly in renal impairment or blood disorders); **interactions**: Appendix 1 (flucytosine)

Renal impairment use normal dose every 12 hours if estimated glomerular filtration rate 20–40 mL/minute/1.73 m²; use normal dose every 24 hours if estimated glomerular filtration rate 10–20 mL/minute/1.73 m²; use initial normal dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m² and then adjust dose according to plasma-flucytosine concentration

Pregnancy teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid—although risk to infant probably small

Side-effects nausea, vomiting, diarrhoea, rashes; less frequently cardiotoxicity, confusion, hallucinations, convulsions, headache, sedation, vertigo, alterations in liver function tests (hepatitis and hepatic necrosis reported), and toxic epidermal necrolysis; blood disorders including thrombocytopenia, leucopenia, and aplastic anaemia reported

Pharmacokinetics for plasma-concentration monitoring blood should be taken shortly before starting the next infusion. Plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre)

Licensed use tablets not licensed

Indication and dose

Systemic yeast and fungal infections, adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

• **By intravenous infusion or by mouth**

Neonate 50 mg/kg every 12 hours

Child 1 month–18 years 50 mg/kg every 6 hours; extremely sensitive organisms, 25–37.5 mg/kg every 6 hours may be sufficient; treatment continued usually for not more than 7 days

Cryptococcal meningitis (adjunct to amphotericin, see Cryptococcosis, p. 362)

• **By intravenous infusion or by mouth**

Neonate 50 mg/kg every 12 hours

Child 1 month–18 years 25 mg/kg every 6 hours for 2 weeks

Administration for *intravenous infusion*, give over 20–40 minutes through a giving set with a 15-micron filter

Ancotil® (Valeant) (P_M)

Intravenous infusion, flucytosine 10 mg/mL. Net price 250-mL infusion bottle = £30.33 (hosp. only)
Electrolytes Na⁺ 34.5 mmol/250-mL bottle

Note Flucytosine tablets may be available from 'special-order' manufacturers or specialist importing companies, see p. 943

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

GRISEOFULVIN

Cautions interactions: Appendix 1 (griseofulvin)

Skilled tasks May impair performance of skilled tasks; effects of alcohol enhanced

Contra-indications systemic lupus erythematosus (risk of exacerbation); acute porphyria (section 9.8.2)

Hepatic impairment avoid in severe liver disease

Pregnancy avoid pregnancy *during* and for 1 month after treatment (fetotoxicity and teratogenicity in *animals*); effective contraception required *during* and for at least 1 month after administration

(**important**: effectiveness of oral contraceptives reduced); also males should avoid fathering a child *during* and for at least 6 months after treatment

Breast-feeding avoid—no information available

Side-effects nausea, vomiting, diarrhoea; headache; less frequently hepatotoxicity, dizziness, confusion, fatigue, sleep disturbances, impaired co-ordination, peripheral neuropathy, leucopenia, systemic lupus erythematosus, rash (including rarely erythema multiforme, toxic epidermal necrolysis), and photosensitivity

1. Capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–18 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg

GRISEFULVIN (*continued*)

Licensed use tablets licensed for use in children (age range not specified by manufacturer); suspension not licensed

Indication and dose

Dermatophyte infections where topical therapy has failed or is inappropriate

• By mouth

Child 1 month–12 years 10 mg/kg (max. 500 mg) once daily or in divided doses; in severe infection dose may be doubled, reducing when response occurs

Child 12–18 years 500 mg once daily or in divided doses; in severe infection dose may be doubled, reducing when response occurs

Tinea capitis caused by *Trichophyton tonsurans*

• By mouth

Child 1 month–12 years 15–20 mg/kg (max. 1 g) once daily or in divided doses

Child 12–18 years 1 g once daily or in divided doses

Griseofulvin (Non-proprietary) ^(PoM)

Tablets, griseofulvin 125 mg, net price 20 = £6.76; 500 mg, 20 = £17.52. Label: 9, 21, counselling, skilled tasks

Suspension, griseofulvin 125 mg/5 mL. Label: 9, 21, counselling, skilled tasks
Available via specialist importing companies

ITRACONAZOLE

Cautions absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary); susceptibility to congestive heart failure (see also CSM advice, below); **interactions:** Appendix 1 (antifungals, triazole)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop. Avoid or use with caution if history of hepatotoxicity with other drugs or in active liver disease. Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment

Counselling Children or their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop

Hepatic impairment use only if potential benefit outweighs risk of hepatotoxicity (see hepatotoxicity above); dose reduction may be necessary

Renal impairment risk of congestive heart failure; bioavailability of oral formulations possibly reduced; use intravenous infusion with caution if estimated glomerular filtration rate 30–80 mL/minute/1.73 m² (monitor renal function); avoid intravenous infusion if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies); ensure effective contraception during treatment and until the next menstrual period following end of treatment

CSM advice (heart failure) Following rare reports of heart failure, the CSM has advised caution when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;
- those with cardiac disease;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Contra-indications acute porphyria (section 9.8.2)

Breast-feeding small amounts present in milk—may accumulate; manufacturer advises avoid

Side-effects very rarely nausea, vomiting, dyspepsia, abdominal pain, diarrhoea, constipation, jaundice, hepatitis (see also Hepatotoxicity

above), heart failure (see CSM advice above), pulmonary oedema, headache, dizziness, peripheral neuropathy (discontinue treatment), menstrual disorder, hypokalaemia, rash, pruritus, Stevens-Johnson syndrome, and alopecia; *with intravenous injection, very rarely* hypertension and hyperglycaemia

Licensed use *Sporanox*[®] capsules and *Sporanox*[®] *Pulse* are not licensed for use in children under 12 years; *Sporanox*[®] liquid and *Sporanox*[®] infusion are not licensed for use in children (age range not specified by manufacturer)

Indication and dose

Oropharyngeal candidiasis

• By mouth

Child 1 month–12 years 3–5 mg/kg once daily; max. 100 mg daily (200 mg daily in AIDS or neutropenia) for 15 days

Child 12–18 years 100 mg once daily (200 mg once daily in AIDS or neutropenia) for 15 days

Pityriasis versicolor

• By mouth

Child 1 month–12 years 3–5 mg/kg (max. 200 mg) once daily for 7 days

Child 12–18 years 200 mg once daily for 7 days

Tinea corporis and tinea cruris

• By mouth

Child 1 month–12 years 3–5 mg/kg (max. 100 mg) once daily for 15 days

Child 12–18 years either 100 mg once daily for 15 days or 200 mg once daily for 7 days

Tinea pedis and tinea manuum

• By mouth

Child 1 month–12 years 3–5 mg/kg (max. 100 mg) once daily for 30 days

Child 12–18 years either 100 mg once daily for 30 days or 200 mg twice daily for 7 days

▣ ITRACONAZOLE (*continued*)

Onychomycosis

- **By mouth**

Child 1–12 years course ('pulse') of 5 mg/kg (max. 200 mg) daily for 7 days; subsequent courses repeated after 21 day intervals; fingernails 2 courses, toenails 3 courses

Child 12–18 years either 200 mg once daily for 3 months or course ('pulse') of 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

Systemic aspergillosis, candidiasis and cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective (limited information available)

- **By mouth**

Child 1 month–18 years 5 mg/kg (max. 200 mg) once daily; increased in invasive or disseminated disease and in cryptococcal meningitis to 5 mg/kg (max. 200 mg) twice daily

- **By intravenous infusion**

Child 1 month–18 years 2.5 mg/kg (max. 200 mg) every 12 hours for 2 days, then 2.5 mg/kg (max. 200 mg) once daily for max. 12 days

Histoplasmosis

- **By mouth**

Child 1 month–18 years 5 mg/kg (max. 200 mg) 1–2 times daily

Maintenance in AIDS patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate

- **By mouth**

Child 1 month–18 years 5 mg/kg (max. 200 mg) once daily, increased to 5 mg/kg (max. 200 mg)

twice daily if low plasma-itraconazole concentration (see Cautions)

Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic

- **By mouth (liquid preparation only)**

Child 1 month–18 years 2.5 mg/kg twice daily starting before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers

Administration For *intravenous infusion*, dilute 250 mg with 50 mL Sodium Chloride 0.9% and give requisite dose through an in-line filter (0.2 micron) over 60 minutes

Sporanox® (Janssen-Cilag) (Pm)

Capsules, blue/pink, enclosing coated beads, itraconazole 100 mg, net price 4-cap pack = £3.90; 15-cap pack = £20.96; 28-cap pack (*Sporanox®-Pulse*) = £27.30; 60-cap pack = £58.49. Label: 5, 9, 21, 25, counselling, hepatotoxicity

Oral liquid, sugar-free, cherry-flavoured, itraconazole 10 mg/mL, net price 150 mL (with 10-mL measuring cup) = £48.62. Label: 9, 23, counselling, administration, hepatotoxicity

Counselling Do not take with food; swish around mouth and swallow, do not rinse afterwards

Concentrate for intravenous infusion, itraconazole 10 mg/mL. For dilution before use. Net price 25-mL amp (with infusion bag and filter) = £66.43
Excipients include propylene glycol

KETOCONAZOLE

Cautions predisposition to adrenocortical insufficiency; **interactions:** Appendix 1 (antifungals, imidazole)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported very rarely; risk of hepatotoxicity greater if given for longer than 10 days. Monitor liver function before treatment, then on weeks 2 and 4 of treatment, then every month. Avoid or use with caution if abnormal liver function tests (avoid in active liver disease) or if history of hepatotoxicity with other drugs. For CSM advice see p. 363

Counselling Children and their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, or dark urine develop

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk (teratogenicity in animal studies)

Contra-indications acute porphyria (section 9.8.2)

Hepatic impairment avoid (see also Hepatotoxicity above)

Breast-feeding manufacturer advises avoid

Side-effects nausea, vomiting, abdominal pain; pruritus; *less commonly* diarrhoea, headache, dizziness, drowsiness, and rash; also reported fatal liver damage (see Hepatotoxicity above), dyspepsia, raised intracranial pressure, paraesthesia, adrenocortical insufficiency, erectile dysfunction, menstrual disorders, azoospermia (with high doses), gynaecomastia, thrombocytopenia, photophobia, photosensitivity, and alopecia

Indication and dose

Dermatophytoses and *Malassezia* folliculitis either resistant to fluconazole, terbinafine, or itraconazole or in patients intolerant of these antifungals; chronic mucocutaneous, cutaneous, and oropharyngeal candidiasis either resistant to fluconazole or itraconazole or in patients intolerant of these antifungals; see also CSM recommendations, p. 363

- **By mouth**

Child body-weight 15–30 kg 100 mg once daily

◊ **KETOCONAZOLE** (*continued*)

Child body-weight over 30 kg 200 mg once daily, increased if response inadequate to 400 mg once daily

Note Treatment continued until symptoms have cleared and cultures negative, but see Cautions (max. duration of treatment 4 weeks for *Malassezia* infection)

Nizoral® (Janssen-Cilag) (POM)

Tablets, scored, ketoconazole 200 mg. Net price 30-tab pack = £14.59. Label: 5, 9, 21, Counselling, hepatotoxicity

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

MICAFUNGIN

Cautions monitor renal function; **interactions:**

Appendix 1 (micafungin)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported. Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop. Use with caution in hepatic impairment (avoid if severe) or if receiving other hepatotoxic drugs. Risk of hepatic side-effects greater in children under 1 year of age

Renal impairment use with caution; deterioration in renal function

Pregnancy manufacturer advises avoid unless essential—toxicity in *animal* studies

Breast-feeding manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies

Side-effects nausea, vomiting, diarrhoea, abdominal pain, hepatomegaly; blood pressure changes, tachycardia; headache, fever; hypokalaemia, hypomagnesaemia, hypocalcaemia, leucopenia, anaemia, thrombocytopenia, renal failure; rash, phlebitis; *less commonly* dyspepsia, constipation, hepatitis and cholestasis (see also Hepatotoxicity above), taste disturbances, anorexia, palpitation, bradycardia, flushing, dyspnoea, sleep disturbances, anxiety, confusion, dizziness, tremor, pancytopenia, eosinophilia, hyponatraemia, hyperkalaemia, hypophosphataemia, hyperhidrosis, and pruritus; *rarely* haemolytic anaemia

Indication and dose**Invasive candidiasis**

- By intravenous infusion

Neonate 2 mg/kg once daily (increased to 4 mg/kg daily if inadequate response) for at least 14 days

Child 1 month–18 years, body-weight under 40 kg 2mg/kg once daily (increased to 4 mg/kg daily if inadequate response) for at least 14 days

Child 1 month–18 years, body-weight over 40 kg 100 mg once daily (increased to 200 mg daily if inadequate response) for at least 14 days

Oesophageal candidiasis

- By intravenous infusion

Child 16–18 years, body-weight under 40 kg 3 mg/kg once daily

Child 16–18 years, body-weight over 40 kg 150 mg once daily

Prophylaxis of candidiasis in children undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days

- By intravenous infusion

Neonate 1 mg/kg once daily; continue for at least 7 days after neutrophil count in desirable range

Child 1 month–18 years, body-weight under 40 kg 1 mg/kg once daily; continue for at least 7 days after neutrophil count in desirable range

Child 1 month–18 years, body-weight over 40 kg 50 mg once daily; continue for at least 7 days after neutrophil count in desirable range

Administration for *intravenous infusion* reconstitute each vial with 5 mL Glucose 5% or Sodium Chloride 0.9%; gently rotate vial, without shaking, to dissolve; dilute requisite dose to a concentration of 0.5–2mg/mL with Glucose 5% or Sodium Chloride 0.9%; protect from light; give over 60 minutes

Mycamine® (Astellas) ▼ (POM)

Intravenous infusion, powder for reconstitution, micafungin (as sodium), net price 50-mg vial = £196.08; 100-mg vial = £341.00

NYSTATIN

Side-effects nausea, vomiting, diarrhoea at high doses; oral irritation and sensitisation; rash (including urticaria) and rarely Stevens-Johnson syndrome reported

Licensed use suspension not licensed for treatment of intestinal candidiasis in neonates; suspension licensed for prophylaxis in neonates as once daily dose; tablets not licensed for use in children (age range not specified by manufacturer)

Indication and dose**Treatment of intestinal candidiasis**

- By mouth

Neonate 100 000 units 4 times daily after feeds

Child 1 month–12 years 100 000 units 4 times daily; immunocompromised children may require higher doses (e.g. 500 000 units 4 times daily)

Child 12–18 years 500 000 units 4 times daily; doubled in severe infection

Oral infection section 12.3.2

▮ NYSTATIN (continued)

Skin infection section 13.10.2

Nystan® (Squibb) (P_M)

Tablets, brown, s/c, nystatin 500 000 units, net price 56-tab pack = £4.37. Label: 9

TERBINAFINE

Cautions psoriasis (risk of exacerbation); auto-immune disease (risk of lupus-erythematosus-like effect) **interactions:** Appendix 1 (terbinafine)

Hepatic impairment manufacturer advises avoid—elimination reduced

Renal impairment use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²

Pregnancy manufacturer advises use only if benefit outweighs risk—no information available

Breast-feeding present in milk—manufacturer advises avoid

Side-effects abdominal discomfort, anorexia, nausea, diarrhoea; headache; rash and urticaria occasionally with arthralgia or myalgia; *less commonly* taste disturbance; *rarely* liver toxicity (including jaundice, cholestasis and hepatitis)—discontinue treatment, angioedema, dizziness, malaise, paraesthesia, hypoaesthesia, photosensitivity, serious skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—discontinue treatment if progressive skin rash; *very rarely* psychiatric disturbances, blood disorders (including incidence of leucopenia higher and thrombocytopenia), lupus erythematosus-like effect, and exacerbation of psoriasis

Licensed use not licensed for use in children

VORICONAZOLE

Cautions electrolyte disturbances, cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs that prolong QT interval; avoid exposure to sunlight; patients at risk of pancreatitis; monitor liver function before treatment and during treatment; haematological malignancy (increased risk of hepatic reactions); monitor renal function; **interactions:** Appendix 1 (antifungals, triazole)

Hepatic impairment in mild to moderate hepatic cirrhosis use usual initial dose then halve subsequent doses; no information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk

Renal impairment excipient in intravenous infusion solution may accumulate if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—manufacturer advises use intravenous infusion only if potential benefit outweighs risk and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required)

Pregnancy toxicity in *animal* studies—manufacturer advises avoid unless potential benefit out-

Suspension, yellow, nystatin 100 000 units/mL, net price 30 mL with pipette = £1.91. Label: 9, counselling, use of pipette
Excipients include alcohol

Indication and dose

Dermatophyte infections of the nails, ringworm infections (including tinea pedis, cruris, corporis, and capitis) where oral therapy appropriate (due to site, severity or extent)

• By mouth

Child over 1 year; body-weight 10–20 kg
62.5 mg once daily

Child body-weight 20–40 kg 125 mg once daily

Child body-weight over 40 kg 250 mg once daily

Note treatment usually for 4 weeks in tinea capitis, 2–6 weeks in tinea pedis, 2–4 weeks in tinea cruris, 4 weeks in tinea corporis, 6 weeks–3 months in nail infections (occasionally longer in toenail infections)

Fungal skin infections section 13.10.2

Terbinafine (Non-proprietary) (P_M)

Tablets, terbinafine (as hydrochloride) 250 mg, net price 14-tab pack = £2.70, 28-tab pack = £3.43. Label: 9

Lamisil® (Novartis) (P_M)

Tablets, white, scored, terbinafine (as hydrochloride) 250 mg, net price 14-tab pack = £23.16, 28-tab pack = £44.66. Label: 9

weighs risk; effective contraception required during treatment

Contra-indications acute porphyria (section 9.8.2)

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, diarrhoea), jaundice; oedema, hypotension, chest pain; respiratory distress syndrome, sinusitis; headache, dizziness, asthenia, anxiety, depression, confusion, agitation, hallucinations, paraesthesia, tremor; influenza-like symptoms; hypoglycaemia; haematuria; blood disorders (including anaemia, thrombocytopenia, leucopenia, pancytopenia), acute renal failure, hypokalaemia; visual disturbances including altered perception, blurred vision, and photophobia; rash, pruritus, photosensitivity, alopecia, cheilitis; injection-site reactions; *less commonly* cholecystitis, pancreatitis, hepatitis, constipation, arrhythmias (including QT interval prolongation), syncope, raised serum cholesterol, hypersensitivity reactions (including flushing), ataxia, nystagmus, hypoaesthesia, adrenocortical insuffi-

▢ VORICONAZOLE (continued)

ciency, arthritis, blepharitis, optic neuritis, scleritis, glossitis, gingivitis, psoriasis, and Stevens-Johnson syndrome; rarely pseudomembranous colitis, convulsions, sleep disturbances, tinnitus, hearing disturbances, extrapyramidal effects, hypertonia, hypothyroidism, hyperthyroidism, discoid lupus erythematosus, toxic epidermal necrolysis, retinal haemorrhage, optic atrophy, and taste disturbances

Indication and dose

Invasive aspergillosis; serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)

• By mouth

Child 2–12 years (oral suspension recommended) 200 mg every 12 hours

Child 12–18 years, body-weight under 40 kg 200 mg every 12 hours for 2 doses then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours

Child 12–18 years, body-weight over 40 kg 400 mg every 12 hours for 2 doses then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

• By intravenous infusion

Child 2–12 years 7 mg/kg every 12 hours (reduced to 4 mg/kg every 12 hours if not tolerated) for max. 6 months

Child 12–18 years 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours (reduced to 3 mg/kg every 12 hours if not tolerated) for max. 6 months

Administration For *intravenous infusion*, reconstitute each 200 mg with 19 mL Water for Injections to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% or Compound Sodium Lactate and give at a rate not exceeding 3 mg/kg/hour

Vfend® (Pfizer) (POM)

Tablets, f/c, voriconazole 50 mg, net price 28-tablet pack = £275.68; 200 mg, 28-tab pack = £1102.74. Label: 9, 11, 23

Oral suspension, voriconazole 200 mg/5 mL when reconstituted with water, net price 75 mL (orange-flavoured) = £551.37. Label: 9, 11, 23

Intravenous infusion, powder for reconstitution, voriconazole, net price 200-mg vial = £77.14

Excipients include sulphobutylether beta cyclodextrin sodium (risk of accumulation in renal impairment)

Electrolytes Na⁺ 9.47 mmol/vial

5.3 Antiviral drugs

- 5.3.1 HIV infection
- 5.3.2 Herpesvirus infections
- 5.3.3 Viral hepatitis
- 5.3.4 Influenza
- 5.3.5 Respiratory syncytial virus

The majority of virus infections resolve spontaneously in immunocompetent subjects. A number of specific treatments for viral infections are available, particularly for the immunocompromised. This section includes notes on herpes simplex and varicella-zoster, human immunodeficiency virus, cytomegalovirus, respiratory syncytial virus, viral hepatitis and influenza.

5.3.1 HIV infection

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) increase life expectancy considerably but they may be associated with serious side-effects.

The natural progression of HIV disease is different in children compared to adults; drug treatment should only be undertaken by specialists within a formal paediatric HIV clinical network. Guidelines and dose regimens are under constant review and for this reason specific dose recommendations have not been included in *BNF for Children*.

Further information on the management of children with HIV can be obtained from the Children's HIV Association (CHIVA) www.chiva.org.uk; and further information on antiretroviral use and toxicity can be obtained from the Paediatric European Network for Treatment of AIDS (PENTA) website www.pentatrials.org.

Principles of treatment Treatment is aimed at suppressing viral replication for as long as possible; it should be started before the immune system is irreversibly damaged. The need for early drug treatment should, however, be balanced against the risk of toxicity. Commitment to treatment and strict adherence over

many years are required; the regimen chosen should take into account convenience and the child's tolerance of treatment. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Initiation of treatment Treatment is based on child's age, CD4 cell count, viral load, and symptoms. Treatment is started in all HIV infected children under 1 year of age regardless of clinical and immunological parameters. The choice of antiviral treatment for children should take into account the method and frequency of administration, risk of side-effects, compatibility of drugs with food, palatability, and the appropriateness of the formulation. Initiating treatment with a combination of drugs ('highly active antiretroviral therapy' which includes 2 nucleoside reverse transcriptase inhibitors with *either* a non-nucleoside reverse transcriptase inhibitor *or* a boosted protease inhibitor) is recommended. The metabolism of many antiretrovirals varies in young children; it may therefore be necessary to adjust the dose according to the plasma-drug concentration. Children who require treatment for both HIV and chronic hepatitis B should receive antivirals that are active against both diseases (section 5.3.3).

Switching therapy Deterioration of the condition (including clinical, virological changes, and CD4 cell changes) may require a complete change of therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance, and the possibility of cross-resistance.

Pregnancy Treatment of HIV infection in pregnancy aims to minimise the viral load and disease progression in the mother and reduce the risk of toxicity to the fetus (but the teratogenic potential of most antiretroviral drugs is unknown). Combination antiretroviral therapy represents optimal treatment but all options require **careful assessment** by a specialist. Combination antiretroviral therapy may be associated with a greater risk of preterm delivery. Consideration also needs to be given to preventing transmission of the infection to the neonate (see below).

Prevention of transmission to neonate Zidovudine given in the perinatal period to the mother and the neonate reduces transmission to the baby. However, optimal treatment of the mother's HIV infection with combination treatment maximises the chance of preventing transmission. Local protocols and national guidelines (www.bhiva.org) should be consulted for recommendations on treatment during pregnancy and the perinatal period.

Breast-feeding Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

Post-exposure prophylaxis Children exposed to HIV infection through needle-stick injury or by another route should be sent to an accident and emergency department for post-exposure prophylaxis [unlicensed indication]. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity.

Drugs used for HIV infection **Zidovudine**, a nucleoside reverse transcriptase inhibitor (or 'nucleoside analogue'), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include **abacavir**, **didanosine**, **emtricitabine**, **lamivudine**, **stavudine**, and **tenofovir**.

The protease inhibitors include **atazanavir**, **darunavir**, **fosamprenavir** (a pro-drug of amprenavir), **indinavir**, **lopinavir**, **nelfinavir**, **ritonavir**, **saquinavir**, and **tipranavir**. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. A combination of lopinavir with low-dose ritonavir is available for use in children over 2 years. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects (see below).

The non-nucleoside reverse transcriptase inhibitors **efavirenz**, **etravirine**, and **nevirapine** are active against the subtype HIV-1 but not HIV-2, a subtype that is rare in the UK. These drugs may interact with a number of drugs metabolised in

the liver. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz. CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz treatment has also been associated with an increased plasma cholesterol concentration. In adults, etravirine is licensed for use in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide, which inhibits HIV from fusing to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs. Enfuvirtide should be combined with other potentially active antiretroviral drugs; it is given by subcutaneous injection.

Maraviroc is an antagonist of the CCR5 chemokine receptor. It is used in patients exclusively infected with CCR5-tropic HIV.

Raltegravir is an inhibitor of HIV integrase. It is used for the treatment of HIV infection resistant to multiple antiretrovirals.

Immune reconstitution syndrome Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms.

Lipodystrophy syndrome Metabolic effects associated with antiretroviral treatment include *fat redistribution*, *insulin resistance* and *dyslipidaemia*; collectively these have been termed *lipodystrophy syndrome*. Children should be encouraged to lead a healthy lifestyle that reduces their long-term cardiovascular risk. Plasma lipids and blood glucose should be measured before starting antiretroviral therapy, after 3–6 months of treatment, and then at least annually. Insulin resistance and hyperglycaemia occur only rarely in children.

Fat redistribution (with loss of subcutaneous fat, increased abdominal fat, 'buffalo hump' and breast enlargement) is associated with regimens containing protease inhibitors and nucleoside reverse transcriptase inhibitors. Stavudine, and to a lesser extent zidovudine, are associated with a higher risk of lipodystrophy and should be used only if alternative regimens are not suitable.

Dyslipidaemia (with adverse effects on body lipids) is associated with antiretroviral treatment, particularly with protease inhibitors; in children, hypercholesterolaemia appears to be more common than hypertriglyceridaemia. Protease inhibitors are associated with insulin resistance and hyperglycaemia but they occur rarely in children. Of the protease inhibitors, atazanavir and darunavir are less likely to cause dyslipidaemia, while saquinavir and atazanavir are less likely to impair glucose tolerance.

Osteonecrosis Osteonecrosis has been reported in children with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

Nucleoside reverse transcriptase inhibitors

Cautions Nucleoside reverse transcriptase inhibitors should be used with caution in children with hepatic impairment (greater risk of hepatic side-effects, see also Lactic Acidosis below). However, some nucleoside reverse transcriptase inhibitors are used in children who also have chronic hepatitis B. They should also be used with caution in renal impairment and in pregnancy (see also p. 373).

Lactic acidosis Life-threatening lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with nucleoside reverse transcriptase inhibitors. They should be used with caution in children with hepatomegaly, hepatitis (especially hepatitis C treated with interferon alfa and ribavirin), liver-enzyme abnormalities and with other risk factors for liver disease and hepatic steatosis. Treatment with the nucleoside reverse transcriptase inhibitor should be **discontinued** in case of symptomatic hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function. Stavudine, especially with didanosine, is associated with a higher risk of lactic acidosis and should be used only if alternative regimens are not suitable.

Side-effects Side-effects of the nucleoside reverse transcriptase inhibitors include gastro-intestinal disturbances (such as nausea, vomiting, abdominal pain, flatulence and diarrhoea), anorexia, pancreatitis, liver damage (see also Lactic Acidosis, above), dyspnoea, cough, headache, insomnia, dizziness, fatigue, blood disorders (including anaemia, neutropenia, and thrombocytopenia), myalgia, arthralgia, rash, urticaria, and fever. See notes above for Lipodystrophy Syndrome (p. 374) and Osteonecrosis (p. 374).

ABACAVIR

Cautions see notes above; also test for HLA-B*5701 allele before treatment—risk of hypersensitivity reaction in presence of HLA-B*5701 allele; **interactions:** Appendix 1 (abacavir)

Hepatic impairment avoid in moderate hepatic impairment unless essential; avoid in severe hepatic impairment

Renal impairment manufacturer advises avoid in end-stage renal disease

Hypersensitivity reactions Life-threatening hypersensitivity reactions reported (more common in Caucasians)—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure (CSM has identified hypersensitivity reactions presenting as sore throat, influenza-like illness, cough, and breathlessness); rarely myolysis; laboratory abnormalities may include raised liver function tests (see Lactic Acidosis above) and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time; monitor for symptoms every 2 weeks for 2 months; discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity

Counselling Children and carers should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment; children or their carers should be advised to keep Alert Card with them at all times

Contra-indications

Pregnancy manufacturer advises avoid (toxicity in animal studies); see also Pregnancy, p. 373

Breast-feeding avoid (see notes above)

Side-effects see notes above; also hypersensitivity reactions (see above); *very rarely* Stevens-

Johnson syndrome and toxic epidermal necrolysis; rash and gastro-intestinal disturbances more common in children

Licensed use Ziagen® not licensed for use in children under 3 months; Kivexa® not licensed for use in children under 12 years; Trizivir® not licensed for use in children

Indication and dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

Ziagen® (GSK) (Pom)

Tablets, yellow, f/c, scored, abacavir (as sulphate) 300 mg, net price 60-tab pack = £221.81. Counselling, hypersensitivity reactions

Oral solution, sugar-free, banana and strawberry flavoured, abacavir (as sulphate) 20 mg/mL, net price 240-mL = £59.15. Counselling, hypersensitivity reactions

Excipients include propylene glycol

With lamivudine

For cautions, contra-indications and side-effects see under individual drugs

Kivexa® (GSK) (Pom)

Tablets, orange, f/c, abacavir (as sulphate) 600 mg, lamivudine 300 mg, net price 30-tab pack = £373.94. Counselling, hypersensitivity reactions

With lamivudine and zidovudine

Note use only if child is stabilised (for 6–8 weeks) on the individual components in the same proportions. For cautions, contra-indications and side-effects see under individual drugs

Trizivir® (GSK) (Pom)

Tablets, blue-green, f/c, abacavir (as sulphate) 300 mg, lamivudine 150 mg, zidovudine 300 mg, net price 60-tab pack = £540.40. Counselling, hypersensitivity reactions

DIDANOSINE

(ddl, DDI)

Cautions see notes above; also history of pancreatitis (preferably avoid, otherwise extreme caution, see also below); peripheral neuropathy or hyperuricaemia (see under Side-effects); ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur; **interactions:** Appendix 1 (didanosine)

Renal impairment reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m²; consult product literature

Hepatic impairment insufficient information but monitor for toxicity

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Pancreatitis If symptoms of pancreatitis develop or if serum lipase is raised and pancreatitis is confirmed, discontinue treatment. Whenever possible avoid concomitant treatment with other drugs known to cause pan-

◀ DIDANOSINE (continued)

creatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if triglycerides elevated

Contra-indications

Breast-feeding avoid (see notes above)

Side-effects see notes above; also pancreatitis (less common in children, see also under cautions), liver failure, anaphylactic reactions, peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), diabetes mellitus, hypoglycaemia, acute renal failure, rhabdomyolysis, dry eyes, retinal and optic nerve changes, dry mouth, parotid gland enlargement, sialadenitis, alopecia, hyperuricaemia (suspend if raised significantly)

Licensed use tablets not licensed for use in children under 3 months; EC capsules not licensed for use in children under 6 years

Indication and dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

Videx® (Bristol-Myers Squibb) (POM)

Tablets, with calcium and magnesium antacids, didanosine 25 mg, net price 60-tab pack = £26.60. Label: 23, counselling, administration, see below
Excipients include aspartame equivalent to phenylalanine 36.5 mg per tablet (section 9.4.1)

Note Antacids in formulation may affect absorption of other drugs—see **interactions**: Appendix 1 (antacids)

Administration to ensure sufficient antacid, each dose to be taken as at least 2 tablets (child under 1 year 1 tablet) chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir

Videx® EC capsules, enclosing e/c granules, didanosine 125 mg, net price 30-cap pack = £51.15; 200 mg, 30-cap pack = £81.84; 250 mg, 30-cap pack = £102.30; 400 mg, 30-cap pack = £163.68.

Label: 25, counselling, administration, see below

Administration capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food

EMTRICITABINE

Cautions see notes above; also on discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis); **interactions**: Appendix 1 (emtricitabine)

Renal impairment reduce dose or increase dosage interval if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; consult product literature

Pregnancy manufacturer advises use only if essential—no information available

Contra-indications

Breast-feeding avoid (see notes above)

Side-effects see notes above; also abnormal dreams, pruritus, and hyperpigmentation

Licensed use not licensed for use in children under 4 months

Indication and dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

Emtriva® (Gilead) (POM)

Capsules, white/blue, emtricitabine 200 mg, net price 30-cap pack = £163.50

Oral solution, orange, emtricitabine 10 mg/mL, net price 170-mL pack (candy-flavoured) = £46.50
Electrolytes Na⁺ 460 micromol/mL

Note 240 mg oral solution ≡ 200 mg capsule; where appropriate the capsule may be used instead of the oral solution

▲ With tenofovir

See under Tenofovir

▲ With efavirenz and tenofovir

See under Tenofovir

LAMIVUDINE

(3TC)

Cautions see notes above; **interactions**: Appendix 1 (lamivudine)

Renal impairment reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; consult product literature

Pregnancy manufacturer advises avoid during first trimester; see also p. 373

Chronic hepatitis B Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine. When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral and serological markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue after discontinuation)—consult product literature

Contra-indications

Breast-feeding avoid (see notes above)

Side-effects see notes above; also peripheral neuropathy, muscle disorders including rhabdomyolysis, nasal symptoms, alopecia

Licensed use *Epivir®* not licensed for use in children under 3 months; *Zeffix®* not licensed for use in children

Indication and dose

See preparations, below

◻ LAMIVUDINE (continued)

Epivir® (GSK) (POM)

Tablets, f/c, lamivudine 150 mg (scored, white), net price 60-tab pack = £152.14; 300 mg (grey), 30-tab pack = £167.21

Oral solution, banana- and strawberry-flavoured, lamivudine 50 mg/5 mL, net price 240-mL pack = £41.41

Excipients include sucrose 1 g/5 mL

Dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

Zeffix® (GSK) (POM)

Tablets, brown, f/c, lamivudine 100 mg, net price 28-tab pack = £78.09

Oral solution, banana and strawberry flavoured, lamivudine 25 mg/5 mL, net price 240-mL pack = £22.79

Excipients include propylene glycol, sucrose 1 g/5 mL

Dose

Chronic hepatitis B infection with either compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis), or decompensated liver disease

• By mouth

Child 2–12 years 3 mg/kg (max. 100 mg) once daily

Child 12–18 years 100 mg once daily

Note Children receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

▲ With abacavir

See under Abacavir

▲ With zidovudine

See under Zidovudine

▲ With abacavir and zidovudine

See under Abacavir

STAVUDINE

(d4T)

Cautions see notes above; also history of peripheral neuropathy (see under Side-effects); history of pancreatitis or concomitant use with other drugs associated with pancreatitis; **interactions:** Appendix 1 (stavudine)

Renal impairment reduce dose to 50% if estimated glomerular filtration rate 25–50 mL/minute/1.73 m²; reduce dose to 25% if estimated glomerular filtration rate less than 25 mL/minute/1.73 m²

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Contra-indications

Breast-feeding avoid (see notes above)

Side-effects see notes above; also peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), abnormal dreams, cognitive dysfunction, drowsiness,

depression, pruritus; *less commonly* anxiety, gynaecomastia

Licensed use capsules not licensed for use in children under 3 months

Indication and dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

Zerit® (Bristol-Myers Squibb) (POM)

Capsules, stavudine 20 mg (brown), net price 56-cap pack = £148.05; 30 mg (light orange/dark orange), 56-cap pack = £155.25; 40 mg (dark orange), 56-cap pack = £159.94 (all hosp. only)

Oral solution, cherry-flavoured, stavudine for reconstitution with water, 1 mg/mL, net price 200 mL = £24.35

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Contra-indications

Breast-feeding avoid (see notes above)

Side-effects see notes above; also hypophosphataemia; *rarely* renal failure; also reported nephrogenic diabetes insipidus, reduced bone density, hypokalaemia, myopathy, and rhabdomyolysis

Licensed use not licensed for use in children

TENOFOVIR DISOPROXIL

Cautions see notes above; also test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases; concomitant or recent use of nephrotoxic drugs; on discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis); **interactions:** Appendix 1 (tenofovir)

Renal impairment increase dose interval if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; avoid *Atripla*® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; avoid *Truvada*® if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

▢ TENOFOVIR DISOPROXIL (*continued*)

Indication and dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

Viread® (Gilead) ▼ (POM)

Tablets, f/c, blue, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £255.00. Label: 21, counselling, administration

Counselling Children with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

▲ With emtricitabine

For **cautions**, **contra-indications**, and **side-effects** see under individual drugs

Truvada® (Gilead) (POM)

Tablets, blue, f/c, tenofovir disoproxil (as fumarate) 245 mg, emtricitabine 200 mg, net price 30-tab pack = £418.50. Label: 21, Counselling, administration

Children with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

▲ With efavirenz and emtricitabine

For **cautions**, **contra-indications**, and **side-effects** see under individual drugs

Atripla® (Gilead) (POM)

Tablets, pink, f/c, efavirenz 600 mg, emtricitabine 200 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £626.90. Label: 23, 25

ZIDOVDINE

(Azidothymidine, AZT)

Note The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug

Cautions see notes above; also haematological toxicity particularly with high dose and advanced disease—monitor full blood count after 4 weeks of treatment, then every 3 months; vitamin B₁₂ deficiency (increased risk of neutropenia); if anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment; **interactions**: Appendix 1 (zidovudine)

Hepatic impairment accumulation may occur

Renal impairment reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; consult product literature

Pregnancy limited information available; manufacturer advises use only if clearly indicated; see also p. 373

Contra-indications abnormally low neutrophil count or haemoglobin concentration (consult product literature); neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature); acute porphyria (section 9.8.2)

Breast-feeding avoid (see notes above)

Side-effects see notes above; also anaemia (may require transfusion), taste disturbance, chest pain, influenza-like symptoms, paraesthesia, neuropathy, convulsions, dizziness, drowsiness, anxiety, depression, loss of mental acuity, myopathy, gynaecomastia, urinary frequency, sweating, pruritus, pigmentation of nails, skin and oral mucosa

Licensed use *Combivir*® is not licensed for use in children with body-weight under 14 kg

Indication and dose

HIV infection in combination with other antiretroviral drugs; prevention of maternal-fetal HIV transmission

For dose, consult Guidelines (see notes above including Prevention of Transmission to Neonate)

Administration for *intermittent intravenous infusion*, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.

For administration *by mouth*, *Combivir*® tablets may be crushed and mixed with semi-solid food or liquid just before administration

Retrovir® (GSK) (POM)

Capsules, zidovudine 100 mg (white/blue band), net price 100-cap pack = £110.98; 250 mg (blue/white/dark blue band), 40-cap pack = £110.98

Oral solution, sugar-free, strawberry-flavoured, zidovudine 50 mg/5 mL, net price 200-mL pack with 10-mL oral syringe = £22.20

Injection, zidovudine 10 mg/mL. For dilution and use as an intravenous infusion. Net price 20-mL vial = £11.14

▲ With lamivudine

For **cautions**, **contra-indications**, and **side-effects** see under individual drugs

Combivir® (GSK) (POM)

Tablets, f/c, zidovudine 300 mg, lamivudine 150 mg, net price 60-tab pack = £318.60

▲ With abacavir and lamivudine

See under Abacavir

Protease inhibitors

Cautions Protease inhibitors should be used with caution in diabetes (see also Lipodystrophy Syndrome, p. 374). Caution is also needed in children with haemophilia who may be at increased risk of bleeding and in hepatic impairment; the risk of hepatic side-effects is increased in children with chronic hepatitis B or C. Atazanavir, darunavir, fosamprenavir, and tipranavir may be used at usual doses

in children with renal impairment, but other protease inhibitors should be used with caution in renal impairment. Indinavir is rarely used in children because of the risk of nephrolithiasis. Protease inhibitors should also be used with caution during pregnancy.

Contra-indications Protease inhibitors should not be given to patients with acute porphyria (section 9.8.2) or to women who are breast-feeding (see also Breast-feeding, p. 373).

Side-effects Side-effects of the protease inhibitors include gastro-intestinal disturbances (including diarrhoea, nausea, vomiting, abdominal pain, flatulence), anorexia, hepatic dysfunction, pancreatitis; blood disorders including anaemia, neutropenia, and thrombocytopenia; sleep disturbances, fatigue, headache, dizziness, paraesthesia, myalgia, myositis, rhabdomyolysis; taste disturbances; rash, pruritus, Stevens-Johnson syndrome, hypersensitivity reactions including anaphylaxis; see also Lipodystrophy Syndrome (p.374) and Osteonecrosis (p.374).

ATAZANAVIR

Cautions see notes above; concomitant use with drugs that prolong PR interval; cardiac conduction disorders; predisposition to QT interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); **interactions:** Appendix 1 (atazanavir)

Hepatic impairment use with caution in mild impairment; avoid in moderate to severe impairment

Pregnancy manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia in neonate if used at term

Contra-indications see notes above

Side-effects see notes above; also peripheral neurological symptoms; *less commonly* mouth ulcers, hypertension, syncope, chest pain, dyspnoea, abnormal dreams, amnesia, disorientation, depression, anxiety, weight changes,

increased appetite, gynaecomastia, nephrolithiasis, urinary frequency, haematuria, proteinuria, arthralgia, and alopecia; *rarely* hepatosplenomegaly, oedema, palpitation, and abnormal gait; also reported cholelithiasis, cholecystitis, and torsade de pointes

Licensed use not licensed for use in children

Indication and dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

Reyataz[®] (Bristol-Myers Squibb) (POM)

Capsules, atazanavir (as sulphate) 150 mg (dark blue/light blue), net price 60-cap pack = £315.69; 200 mg (dark blue), 60-cap pack = £315.69; 300 mg (red/blue), 30-cap pack = £315.69. Label: 5, 21

DARUNAVIR

Cautions see notes above; also sulphonamide sensitivity; **interactions:** Appendix 1 (darunavir)

Hepatic impairment use with caution in mild to moderate hepatic impairment; avoid in severe hepatic impairment—no information available

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Contra-indications see notes above

Side-effects see notes above; also haematemesis, myocardial infarction, chest pain, QT interval prolongation, syncope, tachycardia, bradycardia, palpitation, hypertension, flushing, peripheral oedema, dyspnoea, cough, peripheral neuropathy, anxiety, confusion, memory impairment, convulsions, depression, abnormal dreams, weight changes, pyrexia, hypothyroidism, osteoporosis, gynaecomastia, erectile dysfunction, reduced libido, dysuria, polyuria, nephrolithiasis,

renal failure, arthralgia, visual disturbances, conjunctival hyperaemia, epistaxis, rhinorrhoea, throat irritation, dry mouth, mouth ulcers, stomatitis, nail discoloration, acne, seborrhoeic dermatitis, xeroderma, increased sweating, and alopecia

Licensed use not licensed for use in children

Indication and dose

In combination with other antiretroviral drugs, for HIV infection resistant to other protease inhibitors

For dose, consult Guidelines (see notes above)

Prezista[®] (Janssen-Cilag) (POM)

Tablets, f/c, darunavir (as ethanolate) 300 mg (orange), net price 120-tab pack = £446.70; 400 mg (light orange), 60-tab pack = £297.80; 600 mg (orange), 60-tab pack = £446.70. Label: 21

5 FOSAMPRENAVIR

Note Fosamprenavir is a pro-drug of amprenavir

Cautions see notes above; **interactions:** Appendix 1 (fosamprenavir)

Hepatic impairment Manufacturer advises caution in mild hepatic impairment; reduce dose in moderate to severe hepatic impairment

Pregnancy Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk

Rash Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—rash usually resolves within 2 weeks and may respond to antihistamines

Contra-indications see notes above

Side-effects see notes above; also reported, rash including rarely Stevens-Johnson syndrome (see also Rash above)

5 INDINAVIR

Cautions see notes above; ensure adequate hydration (risk of nephrolithiasis); children at risk of nephrolithiasis (monitor for nephrolithiasis); **interactions:** Appendix 1 (indinavir)

Hepatic impairment increased risk of nephrolithiasis; reduce dose in mild to moderate impairment; not studied in severe impairment

Pregnancy toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia and renal stones in neonate if used at term

Contra-indications see notes above; also contra-indicated in neonates (risk of hyperbilirubinaemia)

Side-effects see notes above; also reported, dry mouth, hypoaesthesia, dry skin, hyperpigmentation, alopecia, paronychia, interstitial nephritis (with medullary calcification and cortical atrophy in asymptomatic severe leucocyturia), nephrolithiasis (may require interruption or discontinuation), dysuria, haematuria, crystalluria, pro-

Licensed use not licensed for use in children under 6 years and body-weight under 25 kg

Indication and dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

Note 700 mg fosamprenavir is equivalent to approx. 600 mg amprenavir

Telzir® (GSK) (POM)

Tablets, f/c, pink, fosamprenavir (as calcium)
700 mg, net price 60-tab pack = £274.92

Oral suspension, fosamprenavir (as calcium)
50 mg/mL, net price 225-mL pack (grape-bubble-gum-and peppermint-flavoured) (with 10-mL oral syringe) = £73.31. Counselling, administration
Excipients include propylene glycol

Administration In children, oral suspension should be taken with food

teinuria, pyuria, pyelonephritis; haemolytic anaemia

Licensed use not licensed for use in children under 4 years

Indication and dose

HIV infection in combination with nucleoside reverse transcriptase inhibitors

For dose, consult Guidelines (see notes above)

Crixivan® (MSD) (POM)

Capsules, indinavir (as sulphate), 200 mg, net price
360-cap pack = £226.28; 400 mg, 180-cap pack = £226.28. Label: 27, counselling, administration

Counselling Administer 1 hour before or 2 hours after a meal; may be administered with a low-fat light meal (may be mixed with apple sauce); in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food

Note Dispense in original container (contains desiccant)

5 LOPINAVIR WITH RITONAVIR

Cautions see notes above; concomitant use with drugs that prolong QT or PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); **interactions:** Appendix 1 (lopinavir, ritonavir)

Hepatic impairment avoid oral solution—high propylene glycol content; manufacturer advises avoid capsules and tablets in severe impairment

Renal impairment avoid oral solution due to high propylene glycol content; use tablets with caution in severe renal impairment

Pregnancy avoid oral solution due to high propylene glycol content; manufacturer advises use capsules and tablets only if potential benefit outweighs risk (toxicity in *animal* studies)

Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

Contra-indications see notes above

Side-effects see notes and Cautions above; also electrolyte disturbances; *less commonly* dysphagia, appetite changes, weight changes, cholecystitis, hypertension, myocardial infarction, palpitation, thrombophlebitis, vasculitis, chest pain, oedema, dyspnoea, cough, agitation, anxiety, amnesia, ataxia, hypertonia, confusion, depression, abnormal dreams, extrapyramidal effects, neuropathy, influenza-like syndrome, Cushing's syndrome, hypothyroidism, menorrhagia, amenorrhoea, sexual dysfunction, breast enlargement, dehydration, nephritis, hypercalcaemia, lactic acidosis, arthralgia, hyperuricaemia, abnormal vision, otitis media, tinnitus, dry mouth, sialadenitis, mouth ulceration, periodontitis, acne, alopecia, dry skin, sweating, skin discoloration, nail disorders; *rarely* prolonged PR interval

◁ LOPINAVIR WITH RITONAVIR (continued)

Licensed use not licensed for use in children under 2 years

Indication and dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

Kaletra® (Abbott) (POM)

Tablets, pale yellow, f/c, lopinavir 100 mg, ritonavir 25 mg, net price 60-tab pack = £76.85. Label: 25

Tablets, yellow, f/c, lopinavir 200 mg, ritonavir 50 mg, net price 120-tab pack = £307.39. Label: 25

Oral solution, lopinavir 400 mg, ritonavir 100 mg/5 mL, net price 5 × 60-mL packs = £307.39. Label: 21

Excipients include propylene glycol 153 mg/mL (see Excipients, p. 3), alcohol 42%

Counselling Oral solution tastes bitter

NELFINAVIR

Cautions see notes above; **interactions:** Appendix 1 (nelfinavir)

Hepatic impairment manufacturer advises caution—no information available

Renal impairment manufacturer advises caution—no information available

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Contra-indications see notes above

Side-effects see notes above; also reported, fever

Licensed use not licensed for use in children under 3 years

Indication and dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

Viracept® (Roche) (POM)

Tablets, blue, f/c, nelfinavir (as mesilate) 250 mg, net price 300-tab pack = £273.16. Label: 21

RITONAVIR

Cautions see notes above; concomitant use with drugs that prolong PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); **interactions:** Appendix 1 (ritonavir)

Hepatic impairment avoid in decompensated liver disease; in severe hepatic impairment without decompensation, use 'booster' doses with caution (avoid treatment doses)

Pregnancy manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies

Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

Contra-indications see notes above

Side-effects see notes and Cautions above; also diarrhoea (may impair absorption—close monitoring required), vasodilatation, cough, throat irritation, anxiety, perioral and peripheral paraesthesia, hyperaesthesia, fever, decreased blood-thyroxine concentration, electrolyte disturbances, raised uric acid, dry mouth, mouth ulcers, and sweating; *less commonly* increased prothrombin time and dehydration; syncope, postural hypotension, seizures, menorrhagia, and renal failure also reported

Licensed use not licensed for use in children under 2 years

Indication and dose

HIV infection in combination with other antiretroviral drugs; low doses used to increase effect of some protease inhibitors

For dose, consult Guidelines (see notes above)

Norvir® (Abbott) (POM)

Capsules, ritonavir 100 mg, net price 84-cap pack = £94.35. Label 21

Excipients include alcohol 12%

Oral solution, sugar-free, ritonavir 400 mg/5 mL, net price 5 × 90-mL packs (with measuring cup) = £403.20. Label: 21, counselling, administration

Excipients include alcohol, propylene glycol

Counselling Oral solution contains 43% alcohol; bitter taste can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry. Administration of ritonavir and didanosine should be separated by at least 2 hours

▲ With lopinavir

See under Lopinavir with ritonavir

SAQUINAVIR

Cautions see notes above; concomitant use of garlic (avoid garlic capsules—reduces plasma-saquinavir concentration); **interactions:** Appendix 1 (saquinavir)

Hepatic impairment manufacturer advises caution in moderate impairment; avoid in severe impairment

Renal impairment dose adjustment possibly required if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Contra-indications see notes above

◊ SAQUINAVIR (continued)

Side-effects see notes above; also dyspnoea, increased appetite, peripheral neuropathy, convulsions, changes in libido, renal impairment, dry mouth, and alopecia

Licensed use not licensed for use in children under 16 years

Indication and dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

TIPRANAVIR

Cautions see notes above; also patients at risk of increased bleeding from trauma, surgery, or other pathological conditions; concomitant use of drugs that increase risk of bleeding; **interactions:** Appendix 1 (tipranavir)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported; monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature)

Hepatic impairment monitor liver function in mild hepatic impairment; avoid in moderate or severe hepatic impairment—no information available

Pregnancy manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies

Contra-indications see notes above

Invirase® (Roche) (POM)

Capsules, brown/green, saquinavir (as mesilate) 200 mg, net price 270-cap pack = £240.06. Label: 21

Tablets, orange, f/c, saquinavir (as mesilate) 500 mg, net price 120-tab pack = £266.73. Label: 21

Side-effects see notes above; also dyspnoea, anorexia, peripheral neuropathy, influenza-like symptoms, renal impairment, and photosensitivity; rarely dehydration

Licensed use not licensed for use in children

Indication and dose

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in children previously treated with antiretrovirals

For dose, consult Guidelines (see notes above)

Apitvus® (Boehringer Ingelheim) ▼ (POM)

Capsules, pink, tipranavir 250 mg, net price 120-cap pack = £490.00. Label: 5, 21

Excipients include ethanol 100 mg per capsule

Non-nucleoside reverse transcriptase inhibitors

EFAVIRENZ

Cautions chronic hepatitis B or C (greater risk of hepatic side-effects); history of mental illness or seizures; **interactions:** Appendix 1 (efavirenz)

Hepatic impairment in mild to moderate liver disease, monitor for dose-related side-effects (e.g. CNS effects) and liver function; avoid in severe hepatic impairment

Renal impairment manufacturer advises caution in severe renal failure—no information available

Pregnancy manufacturer advises avoid unless no alternative available

Rash Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—rash usually resolves within 1 month

Psychiatric disorders Children or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur

Contra-indications acute porphyria (section 9.8.2)

Breast-feeding avoid (see p. 373)

Side-effects rash including Stevens-Johnson syndrome (see Rash above); abdominal pain, diarrhoea, nausea, vomiting; anxiety, depression, sleep disturbances, abnormal dreams, dizziness, headache, fatigue, impaired concentration

(administration at bedtime especially in first 2–4 weeks reduces CNS effects); pruritus; *less commonly* pancreatitis, hepatitis, psychosis, mania, suicidal ideation, amnesia, ataxia, convulsions, and blurred vision; also reported hepatic failure, raised serum cholesterol (see Lipodystrophy syndrome, p. 374), gynaecomastia, photosensitivity; see also Osteonecrosis, p. 374

Licensed use capsules and oral solution not licensed for use in children under 3 years and body-weight under 13 kg; tablets not licensed for use in children with body-weight under 40 kg

Indication and dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

Sustiva® (Bristol-Myers Squibb) (POM)

Capsules, efavirenz 50 mg (yellow/white), net price 30-cap pack = £17.41; 200 mg (yellow), 90-cap pack = £208.40. Label: 23

Administration Capsules may be opened and contents added to food (contents have a peppery taste) [unlicensed use]

Tablets, f/c, yellow, efavirenz 600 mg, net price 30-tab pack = £208.40. Label: 23

EFAVIRENZ (continued)

Oral solution, sugar-free, strawberry and mint flavour, efavirenz 30 mg/mL, net price 180-mL pack = £56.02

Note The bioavailability of *Sustiva*[®] oral solution is lower than that of the capsules and tablets; the oral solution is not interchangeable with either capsules or tablets on a milligram-for-milligram basis

ETRAVIRINE

Cautions chronic hepatitis B or C (greater risk of hepatic side-effects); **interactions:** Appendix 1 (etravirine)

Hepatic impairment use with caution in moderate hepatic impairment; avoid in severe hepatic impairment—no information available

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Rash Rash, usually in the second week, is the most common side-effect and appears more frequently in females; discontinue if severe rash; if rash mild or moderate, may continue without interruption—rash usually resolves within 2 weeks

Contra-indications acute porphyria (section 9.8.2)

Breast-feeding avoid (see p. 373)

Side-effects rash (rarely including Stevens-Johnson syndrome; see also Rash above); gastro-oesophageal reflux, nausea, vomiting, abdominal pain, flatulence, gastritis; hypertension; peripheral neuropathy; diabetes, hyperlipidaemia (see also Lipodystrophy Syndrome, p. 374); renal failure; thrombocytopenia; *less commonly* pancreatitis, haematemesis, stomatitis, hepatitis, myo-

With emtricitabine and tenofovir

See under Tenofovir

cardial infarction, angina, atrial fibrillation, syncope, bronchospasm, amnesia, sleep disturbances, abnormal dreams, anxiety, gynaecomastia, blurred vision, dry mouth, and sweating; also reported, haemorrhagic stroke; see also Osteonecrosis, p. 374

Licensed use not licensed for use in children

Indication and dose

In combination with other antiretroviral drugs (including a boosted protease inhibitor) for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors

For dose, consult Guidelines (see notes above)

Administration for children with swallowing difficulties, tablets may be dispersed in a glass of water just before administration

Intencele[®] (Janssen-Cilag) ▼ (PAM)

Tablets, etravirine 100 mg, net price 120-tab pack = £319.82. Label: 21

Note Dispense in original container (contains desiccant)

NEVIRAPINE

Cautions chronic hepatitis B or C, high CD4 cell count, and females (all at greater risk of hepatic side-effects); **interactions:** Appendix 1 (nevirapine)

Hepatic impairment manufacturer advises caution in moderate hepatic impairment; avoid in severe hepatic impairment; see also Hepatic Disease, below

Pregnancy although manufacturers advise avoid, may be appropriate to use if clearly indicated; see also p. 373

Hepatic disease Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; close monitoring required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction

Rash Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually; monitor closely for skin reactions during first 18 weeks; discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may

continue without interruption but dose should not be increased until rash resolves

Counselling Children and carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions or symptoms of hepatitis develop

Contra-indications acute porphyria (section 9.8.2); severe hepatic impairment; post-exposure prophylaxis

Breast-feeding avoid (see p. 373)

Side-effects rash including Stevens-Johnson syndrome and rarely, toxic epidermal necrolysis (see also Cautions above); nausea, hepatitis (see also Hepatic Disease above), headache; *less commonly* vomiting, abdominal pain, fatigue, fever, and myalgia; *rarely* diarrhoea, angioedema, anaphylaxis, hypersensitivity reactions (may involve hepatic reactions and rash, see Hepatic Disease above), arthralgia, anaemia, and granulocytopenia; *very rarely* neuropsychiatric reactions; see also Osteonecrosis, p. 374

Licensed use tablets, not licensed for use in children weighing less than 50 kg or with body surface area less than 1.25 m²

◊ NEVIRAPINE (continued)

Indication and dose

HIV infection in combination with other antiretroviral drugs

For dose, consult Guidelines (see notes above)

Note If treatment interrupted for more than 7 days reintroduce using low dose and increase dose cautiously

Viramune® (Boehringer Ingelheim) (POM)

Tablets, nevirapine 200 mg, net price 60-tab pack = £160.00. Counselling, hypersensitivity reactions

Suspension, nevirapine 50 mg/5 mL, net price 240-mL pack = £50.40. Counselling, hypersensitivity reactions

Other antiretrovirals**ENFUVIRTIDE**

Cautions chronic hepatitis B or C (possibly greater risk of hepatic side-effects)

Hepatic impairment manufacturer advises caution—no information available

Pregnancy manufacturer advises avoid

Hypersensitivity reactions Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge

Counselling Children and carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek prompt medical attention if symptoms develop

Contra-indications

Breast-feeding avoid (see p. 373)

Side-effects injection-site reactions; pancreatitis, gastro-oesophageal reflux disease, anorexia, weight loss; hypertriglyceridaemia; peripheral neuropathy, asthenia, tremor, anxiety, nightmares, irritability, impaired concentration, vertigo; pneumonia, sinusitis, influenza-like illness; diabetes mellitus; haematuria; renal calculi, lymphadenopathy; myalgia; conjunctivitis; dry

skin, acne, erythema, skin papilloma; *less commonly* hypersensitivity reactions (see Cautions); see also Osteonecrosis, p. 374

Licensed use not licensed for use in children under 6 years

Indication and dose

HIV infection in combination with other antiretroviral drugs for resistant infection or for children intolerant to other antiretroviral regimens

For dose, consult Guidelines (see notes above)

Administration for *subcutaneous injection*, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do **not** shake or invert vial

Fuzeon® (Roche) (POM)

Injection, powder for reconstitution, enfuvirtide 108 mg (= enfuvirtide 90 mg/mL when reconstituted with 1.1 mL Water for Injections), net price 108-mg vial = £19.13 (with solvent, syringe, and alcohol swabs). Counselling, hypersensitivity reactions

MARAVIROC

Cautions cardiovascular disease; chronic hepatitis B or C; **interactions:** Appendix 1 (maraviroc)

Hepatic impairment use with caution

Renal impairment if estimated glomerular filtration rate less than 80 mL/minute/1.73 m², consult product literature

Pregnancy manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies

Contra-indications

Breast-feeding avoid (see notes above, p. 373)

Side-effects nausea, vomiting, abdominal pain, dyspepsia, constipation, diarrhoea; cough; dizziness, paraesthesia, asthenia, sleep disturbances, headache, weight loss; muscle spasms, back pain; taste disturbances; rash, pruritus; *less commonly* pancreatitis, hepatic cirrhosis, rectal bleeding,

myocardial infarction, myocardial ischaemia, bronchospasm, seizures, hallucinations, loss of consciousness, polyneuropathy, pancytopenia, neutropenia, lymphadenopathy, renal failure, polyuria, and myositis; see also Osteonecrosis, p. 374

Licensed use not licensed for use in children

Indication and dose

CCR5-tropic HIV infection in combination with other antiretroviral drugs in children previously treated with antiretrovirals

For dose, consult Guidelines (see notes above)

Celseltir® (Pfizer) (POM)

Tablets, blue, f/c, maraviroc 150 mg, net price 60-tab pack = £551.10; 300 mg, 60-tab pack = £551.10

RALTEGRAVIR

Cautions risk factors for myopathy or rhabdomyolysis; chronic hepatitis B or C (greater risk of hepatic side-effects); **interactions:** Appendix 1 (raltegravir)

Hepatic impairment use with caution in severe hepatic impairment—no information available

Pregnancy manufacturer advises avoid—toxicity in *animal* studies

▢ RALTEGRAVIR (continued)

Contra-indications

Breast-feeding avoid see p. 373

Side-effects abdominal pain, flatulence, constipation, lipodystrophy (see Lipodystrophy Syndrome, p. 374); dizziness, asthenia; arthralgia; pruritis, hyperhidrosis; *less commonly* vomiting, gastritis, hepatitis, myocardial infarction, hypertriglyceridaemia, allodynia, headache, renal failure, anaemia, neutropenia, and muscle spasm; *also reported* rash (including Stevens-Johnson syndrome): see also Osteonecrosis, p. 374

Licensed use not licensed for use in children under 16 years

Indication and dose

In combination with other antiretroviral drugs for HIV infection resistant to multiple antiretrovirals

For dose, consult Guidelines (see notes above)

Isentress® (MSD) ▼ (PoM)

Tablets, pink, f/c, raltegravir (as potassium salt) 400 mg, net price 60-tab pack = £647.29. Label: 25

5.3.2 Herpesvirus infections

5.3.2.1 Herpes simplex and varicella-zoster infection

5.3.2.2 Cytomegalovirus infection

5.3.2.1 Herpes simplex and varicella-zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella-zoster virus.

Herpes simplex infections Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes, section 11.3.3) and of the lips (herpes labialis or cold sores, section 13.10.3) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics (section 12.3.2). Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised child may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections Regardless of immune function and the use of any immunoglobulins, neonates with *chickenpox* should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy is not recommended as absorption is variable.

Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required. Chickenpox is more severe in adolescents than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

In pregnancy severe chickenpox may cause complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Neonates and children who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Specific Immunoglobulins, section 14.5).

In *herpes zoster* (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug. Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management (section 4.7.3).

Choice **Aciclovir** is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin (section 13.10.3) and mucous membranes (section 7.2.2). It is used by mouth for severe herpetic stomatitis (see also p.657). Aciclovir eye ointment (section 11.3.3) is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir, a prodrug of penciclovir, is similar to aciclovir and is licensed in adults for use in herpes zoster and genital herpes; there is limited information available on use in children. Penciclovir itself is used as a cream for herpes simplex labialis (section 13.10.3).

Valaciclovir is an ester of aciclovir, licensed in adults for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed in children over 12 years for preventing cytomegalovirus disease following renal transplantation. Valaciclovir may be used for the treatment of mild herpes zoster in immunocompromised children over 12 years; treatment should be initiated under specialist supervision. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

ACICLOVIR (Acyclovir)

Cautions maintain adequate hydration (especially with infusion or high doses, or during renal impairment); **interactions:** Appendix 1 (aciclovir)

Renal impairment risk of neurological reactions increased; use normal *intravenous* dose every 12 hours if estimated glomerular filtration rate 25–50 mL/minute/1.73 m² (every 24 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m²); consult product literature for intravenous dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². For *herpes zoster*, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²). For *herpes simplex*, use normal oral dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Pregnancy not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk; limited absorption from topical preparations

Breast-feeding significant amount in milk after systemic administration; not known to be harmful but manufacturers advise caution

Side-effects nausea, vomiting, abdominal pain, diarrhoea, headache, fatigue, rash, urticaria, pruritus, photosensitivity; *very rarely* hepatitis, jaundice, dyspnoea, neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysarthria, and drowsiness), acute renal failure, anaemia, thrombocytopenia, and leucopenia; on *intravenous infusion*, severe local inflammation (sometimes leading to ulceration),

and *very rarely* agitation, tremors, psychosis and fever

Licensed use tablets and suspension not licensed for treatment of herpes zoster in children (age range not specified by manufacturer); intravenous infusion not licensed for herpes zoster in children under 18 years; tablets and suspension not licensed for attenuation of chickenpox (if varicella-zoster immunoglobulin not indicated) in children under 18 years

Indication and dose

Herpes simplex treatment

• By mouth

Child 1 month–2 years 100 mg 5 times daily, usually for 5 days (longer if new lesions appear during treatment or if healing incomplete); dose doubled if immunocompromised or if absorption impaired

Child 2–18 years 200 mg 5 times daily, usually for 5 days (longer if new lesions appear during treatment or if healing incomplete); dose doubled if immunocompromised or if absorption impaired

• By intravenous infusion

Neonate 20 mg/kg every 8 hours for 14 days (21 days if CNS involvement)

Child 1–3 months with disseminated herpes simplex 20 mg/kg every 8 hours for 14 days (21 days if CNS involvement)

Child 3 months–12 years 250 mg/m² every 8 hours usually for 5 days, dose doubled if CNS

◊ ACICLOVIR (continued)

involvement (given for up to 21 days) or if immunosuppressed

Child 12–18 years 5 mg/kg every 8 hours usually for 5 days, dose doubled if CNS involvement (given for up to 21 days) or if immunosuppressed

Note To avoid excessive dose in obese patients par-enteral dose should be calculated on the basis of ideal weight for height

Herpes simplex prophylaxis in the immunocompromised

• By mouth

Child 1 month–2 years 100–200 mg 4 times daily

Child 2–18 years 200–400 mg 4 times daily

Chickenpox and herpes zoster infection

• By mouth

Child 1 month–2 years 200 mg 4 times daily for 5 days

Child 2–6 years 400 mg 4 times daily for 5 days

Child 6–12 years 800 mg 4 times daily for 5 days

Child 12–18 years 800 mg 5 times daily for 7 days

• By intravenous infusion

Neonate 10–20 mg/kg every 8 hours for at least 7 days

Child 1–3 months 10–20 mg/kg every 8 hours for at least 7 days

Child 3 months–12 years 250 mg/m² every 8 hours usually for 5 days, dose doubled if immunocompromised

Child 12–18 years 5 mg/kg every 8 hours usually for 5 days, dose doubled if immunocompromised

Note To avoid excessive dose in obese patients par-enteral dose should be calculated on the basis of ideal weight for height

Attenuation of chickenpox if varicella–zoster immunoglobulin not indicated

• By mouth

Child 1 month–18 years 10 mg/kg 4 times daily for 7 days starting 1 week after exposure

Herpesvirus skin infections section 13.10.3

Herpesvirus eye infections section 11.3.3

Administration for intravenous infusion, reconstitute to 25 mg/mL with Water for Injections or Sodium Chloride 0.9% then dilute to concentration of 5 mg/mL with Sodium Chloride 0.9% or Sodium Chloride and Glucose or Compound Sodium Lactate and give over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and central venous access and given over 1 hour

Aciclovir (Non-proprietary) ^(POM)

Tablets, aciclovir 200 mg, net price 25-tab pack = £4.01; 400 mg, 56-tab pack = £9.28; 800 mg, 35-tab pack = £11.42. Label: 9

Brands include *Virovir*[®]

Dental prescribing on NHS Aciclovir Tablets 200 mg or 800 mg may be prescribed

Dispensible tablets, aciclovir 200 mg, net price 25-tab pack = £2.21; 400 mg, 56-tab pack = £7.15; 800 mg, 35-tab pack = £6.54. Label: 9

Suspension, aciclovir 200 mg/5 mL, net price 125 mL = £29.56; 400 mg/5 mL, 100 mL = £33.02. Label: 9

Dental prescribing on NHS Aciclovir Oral Suspension 200 mg/5 mL may be prescribed

Intravenous infusion, powder for reconstitution, aciclovir (as sodium salt). Net price 250-mg vial = £9.13; 500-mg vial = £20.22

Electrolytes Na⁺ 1.1 mmol/250-mg vial

Intravenous infusion, aciclovir (as sodium salt), 25 mg/mL, net price 10-mL (250-mg) vial = £10.37; 20-mL (500-mg) vial = £19.21; 40-mL (1-g) vial = £40.44

Electrolytes Na⁺ 1.16 mmol/250-mg vial

Zovirax[®] (GSK) ^(POM)

Tablets, all dispersible, f/c, aciclovir 200 mg, net price 25-tab pack = £18.80; 800 mg (scored, *Shingles Treatment Pack*), 35-tab pack = £69.85. Label: 9

Suspension, both off-white, sugar-free, aciclovir 200 mg/5 mL (banana-flavoured), net price 125 mL = £29.53; 400 mg/5 mL (*Double Strength Suspension*, orange-flavoured), 100 mL = £33.01. Label: 9

Intravenous infusion, powder for reconstitution, aciclovir (as sodium salt). Net price 250-mg vial = £10.15; 500-mg vial = £18.81

Electrolytes Na⁺ 1.1 mmol/250-mg vial

VALACICLOVIR

Note Valaciclovir is a pro-drug of aciclovir

Cautions see under Aciclovir

Hepatic impairment manufacturer advises caution with high doses used for preventing cytomegalovirus disease—no information available in children

Renal impairment for *herpes zoster*, 1 g every 12 hours if estimated glomerular filtration rate 15–30 mL/minute/1.73 m² (every 24 hours if estimated glomerular filtration rate less than 15 mL/

minute/1.73 m²); for *treatment of herpes simplex*, 500 mg every 24 hours if estimated glomerular filtration rate less than 15 mL/minute/1.73 m²; for *suppression of herpes simplex*, 250 mg (500 mg in immunocompromised) every 24 hours if estimated glomerular filtration rate less than 15 mL/minute/1.73 m²; reduce dose according to estimated glomerular filtration rate for *cytomegalovirus prophylaxis* following renal transplantation (consult product literature)

▢ VALACICLOVIR (*continued*)

Side-effects see under Aciclovir but neurological reactions more frequent with high doses

Licensed use not licensed for use in children except for CMV prophylaxis in children over 12 years

Indication and dose

Herpes zoster in immunocompromised

- By mouth
Child 12–18 years 1 g 3 times daily for 7 days

Treatment of herpes simplex

- By mouth
Child 12–18 years first episode, 500 mg twice daily for 5 days (longer if new lesions appear during treatment or if healing incomplete); recurrent infection, 500 mg twice daily for 5 days

Suppression of herpes simplex

- By mouth
Child 12–18 years 500 mg daily in 1–2 divided doses (in immunocompromised or HIV-positive patients, 500 mg twice daily)

Prevention of cytomegalovirus disease following renal transplantation (preferably starting within 72 hours of transplantation)

- By mouth
Child 12–18 years 2 g 4 times daily usually for 90 days

Valtrex® (GSK) (PAM)

Tablets, f/c, valaciclovir (as hydrochloride) 250 mg, net price 60-tab pack = £130.87; 500 mg, 10-tab pack = £21.86, 42-tab pack = £91.61. Label: 9

5.3.2.2 Cytomegalovirus infection

Recommendations for the optimum maintenance therapy of cytomegalovirus (CMV) infections and the duration of treatment are subject to rapid change.

Ganciclovir is related to aciclovir but it is more active against cytomegalovirus; it is also much more toxic than aciclovir and should therefore be prescribed under specialist supervision and only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the *initial treatment* of CMV infection. The use of ganciclovir may also be considered for symptomatic congenital CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration; cross-resistance to cidofovir is common.

Valaciclovir (section 5.3.2.1) is licensed for use in children over 12 years for prevention of cytomegalovirus disease following renal transplantation.

Foscarnet is also active against cytomegalovirus; it is toxic and can cause renal impairment.

Cidofovir is given in combination with probenecid for CMV retinitis in AIDS patients when ganciclovir and foscarnet are contra-indicated. Cidofovir is nephrotoxic. There is limited information on its use in children.

For local treatment of CMV retinitis, see section 11.3.3.

GANCICLOVIR

Cautions close monitoring of full blood count (severe deterioration may require correction and possibly treatment interruption); history of cytopaenia; low platelet count; potential carcinogen and teratogen; radiotherapy; ensure adequate hydration during intravenous administration; vesicant—infuse into vein with adequate flow preferably using plastic cannula; possible risk of long-term carcinogenic or reproductive toxicity; **interactions:** Appendix 1 (ganciclovir)

Renal impairment reduce dose if estimated glomerular filtration rate less than 70 mL/minute/1.73 m²; consult product literature

Contra-indications hypersensitivity to ganciclovir or aciclovir; abnormally low haemoglobin, neutrophil, or platelet counts (consult product literature)

Pregnancy avoid—teratogenic risk (ensure effective contraception during treatment and barrier contraception for males during and for at least 90 days after treatment)

Breast-feeding avoid—no information available

Side-effects diarrhoea, nausea, vomiting, dyspepsia, abdominal pain, constipation, flatulence, dysphagia, hepatic dysfunction; dyspnoea, chest pain, cough; headache, insomnia, convulsions, dizziness, neuropathy, depression, anxiety, con-

◊ GANCICLOVIR (*continued*)

fusion, abnormal thinking, fatigue, weight loss, anorexia; infection, fever, night sweats; anaemia, leucopenia, thrombocytopenia, pancytopenia, renal impairment; myalgia, arthralgia; macular oedema, retinal detachment, vitreous floaters, eye pain; ear pain, taste disturbance; dermatitis, pruritus; injection-site reactions; *less commonly* mouth ulcers, pancreatitis, arrhythmias, hypotension, anaphylactic reactions, psychosis, tremor, male infertility, haematuria, disturbances in hearing and vision, and alopecia

Licensed use not licensed for use in children

Indication and dose

Life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only; prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation

- **By intravenous infusion**

Child 1 month–18 years initially (induction) 5 mg/kg every 12 hours for 14–21 days for treatment or for 7–14 days for prevention; maintenance (for patients at risk of relapse of retinitis), 6 mg/kg daily on 5 days per week *or* 5 mg/kg daily until adequate recovery of

immunity; if retinitis progresses initial induction treatment may be repeated

Congenital cytomegalovirus infection of the CNS

- **By intravenous infusion**

Neonate 6 mg/kg every 12 hours for 6 weeks

Local treatment of CMV retinitis section 11.3.3

Administration for *intravenous infusion*, reconstitute with Water for Injections (500 mg/10 mL) then dilute to a concentration of not more than 10 mg/mL with Glucose 5% *or* Sodium Chloride 0.9% *or* Compound Sodium Lactate and give over 1 hour

Cymevene® (Roche) (PvM)

Intravenous infusion, powder for reconstitution, ganciclovir (as sodium salt). Net price 500-mg vial = £31.60

Electrolytes Na⁺ 2 mmol/500-mg vial

Caution in handling Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water

FOSCARNET SODIUM

Cautions monitor electrolytes, particularly calcium and magnesium; monitor serum creatinine every second day during induction and every week during maintenance; ensure adequate hydration; avoid rapid infusion; **interactions:** Appendix 1 (foscarnet)

Renal impairment reduce dose; consult product literature

Contra-indications

Pregnancy avoid

Breast-feeding avoid—present in milk in *animal* studies

Side-effects nausea, vomiting, diarrhoea (occasionally constipation and dyspepsia), abdominal pain, anorexia; changes in blood pressure and ECG; headache, fatigue, mood disturbances (including psychosis), asthenia, paraesthesia, convulsions, tremor, dizziness, and other neurological disorders; rash; impairment of renal function including acute renal failure; hypocalcaemia (sometimes symptomatic) and other electrolyte disturbances; abnormal liver function tests; decreased haemoglobin concentration, leucopenia, granulocytopenia, thrombocytopenia; thrombophlebitis if given undiluted by peripheral vein; genital irritation and ulceration (due

to high concentrations excreted in urine); isolated reports of pancreatitis

Licensed use not licensed for use in children

Indication and dose

CMV retinitis

- **By intravenous infusion**

Child 1 month–18 years induction 60 mg/kg every 8 hours for 2–3 weeks then maintenance 60 mg/kg daily, increased to 90–120 mg/kg if tolerated; if retinitis progresses on maintenance dose, repeat induction regimen

Mucocutaneous herpes simplex infection

- **By intravenous infusion**

Child 1 month–18 years 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

Administration for *intravenous infusion*, give undiluted solution via a central venous catheter; alternatively dilute to a concentration of 12 mg/mL with Glucose 5% *or* Sodium Chloride 0.9% for administration via a peripheral vein; give over at least 1 hour

Foscavir® (AstraZeneca) (PvM)

Intravenous infusion, foscarnet sodium hexahydrate 24 mg/mL, net price 250-mL bottle = £34.49

5.3.3 Viral hepatitis

Treatment for viral hepatitis should be initiated by a specialist in hepatology or infectious diseases. The management of uncomplicated acute viral hepatitis is largely symptomatic. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. For details on immunisation against hepatitis A and B infections, see section 14.4 (active immunisation) and section 14.5 (passive immunisation).

Chronic hepatitis B **Interferon alfa** (section 8.2.4), **peginterferon alfa-2a**, **lamivudine** (section 5.3.1), and **adefovir dipivoxil** have a role in the treatment of chronic hepatitis B in adults but their role in children has not been established. Specialist supervision is required for the management of chronic hepatitis B.

Tenofovir, or a combination of tenofovir with either emtricitabine or lamivudine, may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' (section 5.3.1) in children who require treatment for both HIV and chronic hepatitis B. If children infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV. Management of these children should be co-ordinated between HIV and hepatology specialists.

Chronic hepatitis C Treatment should be considered for children with moderate or severe liver disease. Specialist supervision is required and the regimen is chosen according to the genotype of the infecting virus and the viral load. A combination of **ribavirin** (section 5.3.5) and **interferon alfa** (section 8.2.4) is licensed for use in children over 3 years with chronic hepatitis C. A combination of **peginterferon alfa** (BNF Section 8.2.4) and ribavirin is preferred.

5.3.4 Influenza

For advice on immunisation against influenza, see section 14.4.

Oseltamivir and **zanamivir** reduce replication of influenza A and B viruses by inhibiting viral neuraminidase. They are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; oseltamivir is licensed for use within 48 hours of the first symptoms while zanamivir is licensed for use within 36 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. For further information on the treatment of influenza, see NICE guidance, p. 391.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza (see also NICE guidance, p. 391). Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

Oseltamivir in children under 1 year of age Safety data on the use of oseltamivir in children under 1 year of age is limited and it is not licensed for use in this age group. Furthermore, oseltamivir may be ineffective in neonates and very young infants because they may not be able to metabolise oseltamivir to its active form. In exceptional circumstances, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that, during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

Amantadine is licensed for prophylaxis and treatment of influenza A in children over 10 years of age, but it is no longer recommended (see NICE guidance, p. 391).

Information on pandemic influenza, avian influenza, and swine influenza can be found at www.dh.gov.uk/pandemicflu and at www.hpa.org.uk.

NICE guidance**Oseltamivir, zanamivir, and amantadine for prophylaxis and treatment of influenza (September 2008 and February 2009)**

The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Amantadine is **not** recommended for prophylaxis or treatment of influenza.
- Oseltamivir or zanamivir are **not** recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community¹, either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk children who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza.
- When influenza is circulating in the community¹, oseltamivir or zanamivir is recommended (in accordance with UK licensing) for the treatment of influenza in at-risk children who can start treatment within 48 hours (within 36 hours for zanamivir) of the onset of symptoms.
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for post-exposure prophylaxis or treatment in at-risk children (regardless of influenza vaccination) living in long-term residential or nursing homes.

At-risk children are those who have one or more of the following conditions:

- chronic respiratory disease (including asthma);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

OSELTAMIVIR**Cautions**

Renal impairment reduce dose by 50% if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Pregnancy avoid unless potential benefit outweighs risk

Breast-feeding avoid unless potential benefit outweighs risk; present in milk in *animal* studies

Side-effects nausea, vomiting, abdominal pain, diarrhoea; headache; conjunctivitis; *less commonly* rash; also reported hepatitis, arrhythmias, neuropsychiatric disorders, visual disturbances, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Licensed use not licensed for use in children under 1 year

Indication and dose**Prevention of influenza**• **By mouth**

Child under 1 year (under specialist supervision, see notes above) 2 mg/kg once daily for 10 days for post-exposure prophylaxis

Child 1–13 years

Body-weight under 15 kg 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Body-weight 15–23 kg 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Body-weight 23–40 kg 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Body-weight over 40 kg 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

1. National surveillance schemes, including those run by the Health Protection Agency, should be used to indicate when influenza is circulating in the community.

◻ OSELTAMIVIR (continued)

Child 13–18 years 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Treatment of influenza

• By mouth

Child under 1 year (see notes above) 2 mg/kg twice daily for 5 days

Child 1–13 years

Body-weight under 15 kg 30 mg twice daily for 5 days

Body-weight 15–23 kg 45 mg twice daily for 5 days

Body-weight 23–40 kg 60 mg twice daily for 5 days

Body-weight over 40 kg 75 mg twice daily for 5 days

Child 13–18 years 75 mg twice daily for 5 days

Administration if suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as yoghurt, just before administration

¹ **Tamiflu**® (Roche) ▼ (POM)

Capsules, oseltamivir (as phosphate) 30 mg (yellow), net price 10-cap pack = £8.18; 45 mg (grey), 10-cap pack = £16.36; 75 mg (grey-yellow), 10-cap pack = £16.36. Label: 9

Suspension, sugar-free, tutti-frutti-flavoured, oseltamivir (as phosphate) for reconstitution with water, 60 mg/5 mL, net price 75 mL = £16.36. Label: 9

Excipients include sorbitol 1.7 g/5 mL

- 1.** **(MPS)** except for the treatment and prophylaxis of influenza as indicated in the notes above and NICE guidance; endorse prescription 'SLS'

ZANAMIVIR

Cautions asthma and chronic pulmonary disease (risk of bronchospasm—short-acting bronchodilator should be available; avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm); uncontrolled chronic illness; other inhaled drugs should be administered before zanamivir

Pregnancy only use if potential benefit outweighs risk—no information available

Contra-indications

Breast-feeding avoid—present in milk in animal studies

Side-effects very rarely bronchospasm, respiratory impairment, angioedema, urticaria, and rash; also reported neuropsychiatric disorders

Indication and dose

Post-exposure prophylaxis of influenza

• By inhalation of powder

Child 5–18 years 10 mg once daily for 10 days

Prevention of influenza during an epidemic

• By inhalation of powder

Child 5–18 years 10 mg once daily for up to 28 days

Treatment of influenza

• By inhalation of powder

Child 5–18 years 10 mg twice daily for 5 days

¹ **Relenza**® (GSK) (POM)

Dry powder for inhalation disks containing 4 blisters of zanamivir 5 mg/blister, net price 5 disks with *Diskhaler*® device = £16.36

- 1.** **(MPS)** except for the treatment and prophylaxis of influenza as indicated in the notes above and NICE guidance; endorse prescription 'SLS'

5.3.5 Respiratory syncytial virus

Ribavirin (tribavirin) inhibits a wide range of DNA and RNA viruses. It is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis. Ribavirin is given by mouth with peginterferon alfa or interferon alfa for the treatment of chronic hepatitis C infection (see Viral Hepatitis, section 5.3.3). Ribavirin is also effective in Lassa fever and has also been used parenterally in the treatment of life-threatening RSV, parainfluenza virus, and adenovirus infections in immunocompromised children [unlicensed indications].

Palivizumab is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation. Palivizumab should be considered for children under 6 months with haemodynamically significant left-to-right shunt congenital heart disease or who have pulmonary hypertension. It should also be considered for children under 2 years either with chronic lung disease who are using oxygen at home (or have been on prolonged oxygen treatment) or with

severe congenital immunodeficiency. Palivizumab may also be used for the first 6–12 months of life in a child born at under 35 weeks gestation, if the child is considered by the specialist to be at special risk of hospitalisation. It is licensed for monthly use during the RSV season; the first dose should be administered before the start of the RSV season.

PALIVIZUMAB

Cautions moderate to severe acute infection or febrile illness; thrombocytopenia; serum-palivizumab concentration may be reduced after cardiac surgery

Contra-indications hypersensitivity to humanised monoclonal antibodies

Side-effects fever, injection-site reactions, nervousness; *less commonly* diarrhoea, vomiting, constipation, haemorrhage, rhinitis, cough, wheeze, pain, drowsiness, asthenia, hyperkinesia, leucopenia, and rash; *rarely* apnoea, hypersensitivity reactions (including anaphylaxis)

Licensed use not licensed in children with congenital immunodeficiency or in children born at 35 weeks gestation or less and older than 6 months (licensed in children under 6 months)

Indication and dose

Prevention of serious disease caused by respiratory syncytial virus infection (see notes above)

- By intramuscular injection (preferably in anterolateral thigh)

Neonate 15 mg/kg once a month during season of RSV risk

Child 1 month–2 years 15 mg/kg once a month during season of RSV risk (child undergoing cardiac bypass surgery, 15 mg/kg as soon as stable after surgery, then once a month during season of risk); injection volume over 1 mL should be divided between 2 or more sites

Synagis® (Abbott) ▼ (POM)

Injection, powder for reconstitution, palivizumab, net price 50-mg vial = £360.40; 100-mg vial = £663.11

RIBAVIRIN

(Tribavirin)

Cautions

Specific cautions for inhaled treatment Maintain standard supportive respiratory and fluid management therapy; monitor electrolytes closely; monitor equipment for precipitation; pregnant women (and those planning pregnancy) should avoid exposure to aerosol

Specific cautions for systemic treatment Exclude pregnancy before treatment in females of childbearing age; effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age; routine monthly pregnancy tests recommended; condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen); cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration); determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature); eye examination recommended before oral treatment; eye examination also recommended during oral treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops; test thyroid function before treatment and then every 3 months

Interactions: Appendix 1 (ribavirin)

Hepatic impairment no dosage adjustment required; use oral ribavirin with caution in severe hepatic dysfunction or decompensated cirrhosis

Renal impairment plasma-ribavirin concentration increased; manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Contra-indications

Pregnancy avoid (important teratogenic risk: see Cautions)

Breast-feeding avoid

Specific contra-indications for systemic treatment

Severe cardiac disease, including unstable or uncontrolled cardiac disease in previous 6 months; haemoglobinopathies; severe debilitating medical conditions; severe hepatic dysfunction or decompensated cirrhosis; autoimmune disease (including autoimmune hepatitis); history of severe psychiatric condition

Side-effects

Specific side-effects for inhaled treatment Worsening respiration, bacterial pneumonia, and pneumothorax reported; rarely non-specific anaemia and haemolysis

Specific side-effects for systemic treatment Haemolytic anaemia (anaemia may be improved by epoetin); also (in combination with peginterferon alfa or interferon alfa) nausea, vomiting, dyspepsia, abdominal pain, peptic ulcer, flatulence, diarrhoea, constipation, colitis, pancreatitis, growth retardation (including decrease in height and weight), appetite changes, weight loss, pulmonary embolism, chest pain, tachycardia, palpitation, syncope, cerebrovascular disease, peripheral oedema, changes in blood pressure, flushing, Raynaud's disease, hypertriglyceridaemia, dyspnoea, cough, interstitial pneumonitis, sleep disturbances, abnormal dreams, asthenia, impaired concentration and memory, psychoses, anxiety, depression, suicidal ideation, dizziness, hyperkinesia, tremor, hypertension, seizures, ataxia, dysphonia, peripheral neuropathy, influenza-like symptoms, headache, hyperglycaemia, thyroid disorders, menstrual disturbances, virilism, testicular pain, micturition disorders, leucopenia, thrombocytopenia, aplastic anaemia, lymphadenopathy, hypocalcaemia, renal failure, hyperuricaemia, myalgia, arthralgia, systemic lupus erythematosus, vasculitis, sarcoidosis, eye changes (including blurred vision and retinopathy), rhinitis, tinnitus, hearing impairment, dry mouth, stomatitis, glossitis, taste disturbance, pharyngitis, gingivitis, tooth disorders, rash (including very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis), pruritus, urticaria, photosensitivity, psoriasis, alopecia, dry skin, skin discoloration, increased sweating

▮ RIBAVIRIN (continued)

Licensed use inhalation licensed for use in children (age range not specified by manufacturer); intravenous preparation not licensed

Indication and dose

Bronchiolitis

- By aerosol inhalation or nebulisation (via small particle aerosol generator)

Child 1 month–2 years inhale solution containing 20 mg/mL for 12–18 hours for at least 3 days; max. 7 days

Life-threatening RSV, parainfluenza virus, and adenovirus infection in immunocompromised children (seek expert advice)

- By intravenous infusion over 15 minutes

Child 1 month–18 years 33 mg/kg as a single dose, then 16 mg/kg every 6 hours for 4 days, then 8 mg/kg every 8 hours for 3 days

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation

- By mouth

Child over 3 years; body-weight under 47 kg 15 mg/kg daily in 2 divided doses

Child body-weight 47–50 kg 200 mg in the morning and 400 mg in the evening

Child body-weight 50–65 kg 400 mg twice daily

Child body-weight 65–86 kg 400 mg in the morning and 600 mg in the evening

Child body-weight 86–105 kg 600 mg twice daily

Child body-weight over 105 kg 600 mg in the morning and 800 mg in the evening

Rebetol® (Schering-Plough) (POM)

Capsules, ribavirin 200 mg, net price 84-cap pack = £275.65, 140-cap pack = £459.42, 168-cap pack = £551.30. Label: 21

Oral solution, ribavirin 200 mg/5 mL, net price 100 mL (bubble-gum-flavoured) = £69.71. Label: 21

Virazole® (Valeant) (POM)

Inhalation ▀ ribavirin 6 g for reconstitution with 300 mL water for injections. Net price 3 × 6-g vials = £349.00

Intravenous infusion, 100 mg/mL, 10-mL amp Available on a named-patient basis from Valeant

5.4 Antiprotozoal drugs

- 5.4.1 Antimalarials
- 5.4.2 Amoebicides
- 5.4.3 Trichomonacides
- 5.4.4 Antigiardial drugs
- 5.4.5 Leishmaniocides
- 5.4.6 Trypanocides
- 5.4.7 Drugs for toxoplasmosis
- 5.4.8 Drugs for pneumocystis pneumonia

5.4.1 Antimalarials

Recommendations on the prophylaxis and treatment of malaria reflect guidelines agreed by UK malaria specialists. Choice will depend on the age of the child (see below).

The centres listed above should be consulted for advice on special problems.

Treatment of malaria

If the infective species is **not known**, or if the infection is **mixed**, initial treatment should be as for *falciparum malaria* with quinine, *Malarone*[®] (proguanil with atovaquone), or *Riamet*[®] (artemether with lumefantrine). *Falciparum malaria* can progress rapidly in unprotected children and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by *Plasmodium falciparum*. In most parts of the world *P. falciparum* is now resistant to chloroquine which should not therefore be given for treatment.

Quinine, *Malarone*[®] (proguanil with atovaquone), or *Riamet*[®] (artemether with lumefantrine) can be given *by mouth* if the child can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given *by intravenous infusion* (see below) if the child is seriously ill or unable to take tablets. **Mefloquine** is now rarely used for treatment because of concerns about resistance.

Oral. Quinine is well tolerated by children although the salts are bitter.

The dosage regimen for quinine *by mouth* is:

10 mg/kg (of quinine salt¹; max. 600 mg) every 8 hours for 7 days

together with or followed by

either **clindamycin** 7–13 mg/kg (max. 450 mg) every 8 hours for 7 days
[unlicensed indication]

or, in children over 12 years, **doxycycline** 200 mg once daily for 7 days

If the parasite is likely to be sensitive, **pyrimethamine** with **sulfadoxine** as a single dose [unlicensed] may be given instead of either clindamycin or doxycycline together with or after a course of quinine.

The dose regimen for pyrimethamine with sulfadoxine by mouth is:

Child up to 4 years and body-weight over 5 kg pyrimethamine 12.5 mg with sulfadoxine 250 mg as a single dose

Child 5–6 years pyrimethamine 25 mg with sulfadoxine 500 mg as a single dose

Child 7–9 years pyrimethamine 37.5 mg with sulfadoxine 750 mg as a single dose

Child 10–14 years pyrimethamine 50 mg with sulfadoxine 1 g as a single dose

Child 14–18 years pyrimethamine 75 mg with sulfadoxine 1.5 g as a single dose

Alternatively, *Malarone*[®], or *Riamet*[®] may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after *Malarone*[®] or *Riamet*[®] treatment.

The dose regimen for *Malarone*[®] *by mouth* is:

Child body-weight 5–8 kg, 2 'paediatric' tablets once daily for 3 days

Child body-weight 9–10 kg, 3 'paediatric' tablets once daily for 3 days

Child body-weight 11–20 kg, 1 'standard' tablet once daily for 3 days

Child body-weight 21–30 kg, 2 'standard' tablets once daily for 3 days

Child body-weight 31–40 kg, 3 'standard' tablets once daily for 3 days

Child body-weight over 40 kg, 4 'standard' tablets once daily for 3 days

1. Valid for quinine hydrochloride, dihydrochloride, and sulphate; not valid for quinine bisulphate which contains a correspondingly smaller amount of quinine.

The dose regimen for *Riamet*[®] by mouth is:

Child body-weight 5–15 kg 1 tablet initially, followed by 5 further doses of 1 tablet each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours)

Child body-weight 15–25 kg 2 tablets initially, followed by 5 further doses of 2 tablets each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours)

Child body-weight 25–35 kg 3 tablets initially, followed by 5 further doses of 3 tablets each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)

Child 12–18 years and body-weight over 35 kg, 4 tablets initially followed by 5 further doses of 4 tablets each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours)

Parenteral. If the child is seriously ill or unable to swallow tablets, **quinine** should be given by *intravenous infusion*. The dose regimen for quinine by *intravenous infusion* is calculated on a mg/kg basis:

Neonates and children, loading dose^{1,2} of 20 mg/kg (up to maximum 1.4 g) of quinine salt² infused over 4 hours *then 8 hours after the start of the loading dose*, maintenance dose of 10 mg/kg⁴ (up to maximum 700 mg) of quinine salt³ infused over 4 hours every 8 hours (until child can swallow tablets to complete the 7-day course *together with or followed by either clindamycin or doxycycline* as above).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south-east Asia) because intravenous **artesunate** may be available for ‘named-patient’ use.

Pregnancy Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The treatment doses of oral and intravenous quinine given above (including the loading dose) can safely be given in pregnancy. Clindamycin [unlicensed indication] should be given for 7 days with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development in fetus); pyrimethamine with sulfadoxine, *Malarone*[®], and *Riamet*[®] are also best avoided until more information is available.

Benign malarias (treatment)

Benign malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. **Chloroquine**⁵ is the drug of choice for the treatment of benign malarias (but chloroquine-resistant *P. vivax* infection has been reported from Indonesia, New Guinea and some adjacent islands).

Chloroquine alone is adequate for *P. malariae* infections but in the case of *P. vivax* and *P. ovale*, a **radical cure** (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with **primaquine**⁶ given after the chloroquine.

The dosage regimen of chloroquine by *mouth* for benign malaria in children is:

initial dose of 10 mg/kg of base (max. 620 mg) *then*

a single dose of 5 mg/kg of base (max. 310 mg) after 6–8 hours *then*

a single dose of 5 mg/kg of base (max. 310 mg) daily for 2 days

For a **radical cure**, **primaquine**⁶ [unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age. Primaquine is given in a dose of 250 micrograms/kg (max. 15 mg) daily for 14

1. In intensive care units the loading dose can alternatively be given as quinine salt³ 7 mg/kg infused over 30 minutes followed immediately by 10 mg/kg over 4 hours then (after 8 hours) maintenance dose as described.
2. **Important:** the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours
3. Valid for quinine hydrochloride, dihydrochloride, and sulphate; not valid for quinine bisulphate which contains a correspondingly smaller amount of quinine.
4. Maintenance dose should be reduced to 5–7 mg/kg of quinine salt in children with severe renal impairment, severe hepatic impairment, or if parenteral treatment is required for more than 48 hours.
5. For the treatment of chloroquine-resistant benign malaria *Malarone*[®] [unlicensed indication], quinine, or *Riamet*[®] [unlicensed indication] can be used; as with chloroquine, primaquine should be given for radical cure.
6. Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency. In mild G6PD deficiency, primaquine in a dose of 750 micrograms/kg (max. 45 mg) once a week for 8 weeks, has been found useful and without undue harmful effects.

days in *P. ovale* infection or 500 micrograms/kg (max. 30 mg) daily for 14 days in *P. vivax* infection.

Pregnancy Treatment doses of chloroquine can be given for benign malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be **postponed** until the pregnancy is over; instead chloroquine should be continued at a dose of 10 mg/kg (max. 310 mg) each week during the pregnancy.

Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular child should take into account:

- risk of exposure to malaria;
- extent of drug resistance;
- efficacy of the recommended drugs;
- side-effects of the drugs;
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen).

Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. **Weight is a better guide than age.** If in doubt obtain advice from specialist centre, see p. 394.

Protection against bites **Prophylaxis is not absolute**, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin provide the most effective barrier protection against insects (infants should sleep with a mosquito net stretched over the cot or baby carrier); mats and vaporised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. Long sleeves and trousers worn after dusk also provide protection.

Length of prophylaxis In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (preferably 2–3 weeks in the case of mefloquine) before travel into an endemic area (or if not possible at earliest opportunity up to 1 or 2 days before travel); *Malarone*[®] or doxycycline prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for **4 weeks after leaving** (except for *Malarone*[®] prophylaxis which should be stopped 1 week after leaving).

In those requiring long-term prophylaxis, chloroquine and proguanil may be used for periods of over 5 years. Mefloquine is licensed for use up to 1 year (although it has been used for up to 3 years without undue problems). Doxycycline can be used for up to 2 years. *Malarone*[®] is licensed for use for up to 28 days but can be used for up to 1 year (and possibly longer) with caution. Specialist advice should be sought for long-term prophylaxis.

Return from malarial region It is important to be aware that **any illness** that occurs within 1 year and **especially within 3 months of return might be malaria** even if all recommended precautions against malaria were taken. Travellers and carers of children should be **warned** of this and told that if they develop any illness **particularly within 3 months** of their return they should go **immediately** to a doctor and specifically mention their exposure to malaria.

Epilepsy Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in children with a history of epilepsy. In areas *without chloroquine resistance*, proguanil alone is recommended; in areas *with chloroquine resistance*, doxycycline or *Malarone*[®] may be considered. The metabolism of doxycycline may be influenced by antiepileptics (see **interactions**: Appendix 1 (tetracyclines)).

Asplenia Asplenic children (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Renal impairment Avoidance (or dosage reduction) of proguanil is recommended since it is excreted by the kidneys. *Malarone*® should not be used for prophylaxis in children with estimated glomerular filtration rate less than 30 mL/minute/1.73 m². Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

Pregnancy Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in sub-saharan Africa; in the case of proguanil, folic acid 5 mg daily should be given. The centres listed on p. 394 should be consulted for advice on prophylaxis in chloroquine-resistant areas. The manufacturer advises that prophylaxis with mefloquine should be avoided as a matter of principle but studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy. *Malarone*® should be avoided during pregnancy unless there is no suitable alternative.

Breast-feeding Prophylaxis is required in **breast-fed infants**; although anti-malarials are present in milk, the amounts are too variable to give reliable protection.

Specific recommendations

Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice.

Risk may vary in different parts of a country—check under all risk levels

Important Settled immigrants and their carers (or long-term visitors) to the UK may be unaware that they will have **lost some of their immunity** and also that the areas where they previously lived **may now be malarious**

North Africa, the Middle East, and Central Asia

Very low risk Risk *very low* in Algeria, Egypt (but *low risk* in El Faiyum, see below), Georgia (south-east, July–October), Kyrgystan (but *low risk* in south-west, see below), Libya, rural Morocco, most tourist areas of Turkey (but *low risk* in Adana and border with Syria, see below), Uzbekistan (extreme south-east only):

chemoprophylaxis not recommended but avoid mosquito bites and consider malaria if fever presents

Low risk Risk *low* in Armenia (June–October), Azerbaijan (southern border areas, June–September), Egypt (El Faiyum only, June–October), Iran (northern border with Azerbaijan, May–October; *variable risk* in rural south-east provinces; see below), rural north Iraq (May–November), Kyrgystan (south-west, May–October), north border of Syria (May–October), Turkey (plain around Adana and east of there, border with Syria, March–November), Turkmenistan (south-east only, June–October):

preferably

chloroquine *or* (if chloroquine not appropriate) proguanil hydrochloride

Variable risk Risk *variable* and *chloroquine resistance present* in Afghanistan (below 2000 m, May–November), Iran (rural south-east provinces, March–November, see also *Low risk* above), Oman (remote rural areas only), Saudi

Arabia (south-west and rural areas of western region; no risk in Mecca, Medina, Jeddah, or high-altitude areas of Asir Province), Tajikistan (June–October), Yemen (no risk in Sana'a):

chloroquine + proguanil hydrochloride *or* (if chloroquine + proguanil not appropriate and child over 12 years) doxycycline

Sub-Saharan Africa

No chemoprophylaxis recommended for Cape Verde (some risk on São Tiago) and Mauritius (but avoid mosquito bites and consider malaria if fever presents)

Very high risk Risk *very high* (or *locally very high*) and *chloroquine resistance very widespread* in Angola, Benin, Botswana (northern half, November–June), Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Comoros, Congo, Democratic Republic of the Congo (formerly Zaire), Djibouti, Equatorial Guinea, Eritrea, Ethiopia (below 2000 m; no risk in Addis Ababa), Gabon, Gambia, Ghana, Guinea, Guinea-Bissau, Ivory Coast, Kenya, Liberia, Madagascar, Malawi, Mali, Mauritania (all year in south; July–October in north), Mozambique, Namibia (all year along Kavango and Kunene rivers; November–June in northern third), Niger, Nigeria, Principe, Rwanda, São Tomé, Senegal, Sierra Leone, Somalia, South Africa (low-altitude areas of Mpumalanga and Limpopo Provinces, Kruger National Park, and north-east KwaZulu-Natal as far south as Jozini), Sudan, Swaziland, Tanzania, Togo, Uganda, Zambia, Zimbabwe (all year in Zambezi valley; November–June in other areas below 1200 m; risk negligible in Harare and Bulawayo):

mefloquine *or* doxycycline (if child over 12) *or* Malarone®

Note In Zimbabwe and neighbouring countries, pyrimethamine with dapsone (also known as *Deltaprim*®) prophylaxis is used by local residents (sometimes with chloroquine—this regimen is not recommended).

South Asia

Low risk Risk *low* in Bangladesh (but *high risk* in Chittagong Hill Tracts, see below), India (Kerala [southern states], Tamil Nadu, Karnataka, Southern Andhra Pradesh [including Hyderabad and Mumbai], Rajasthan [including Jaipur], Uttar Pradesh [including Agra], Haryana, Uttaranchal, Himachal Pradesh, Jammu, Kashmir, Punjab, Delhi; *variable risk* in other areas, see below; *high risk* in Assam), Sri Lanka (but *variable risk* north of Vavuniya, see below):

chemoprophylaxis not recommended but avoid mosquito bites and consider malaria if fever present

Variable risk Risk *variable* and *chloroquine resistance usually moderate* in southern districts of Bhutan, India (*low risk* in some areas, see above; *high risk* in Assam, see below), Nepal (below 1500 m, especially Terai districts; no risk in Kathmandu), Pakistan (below 2000 m), Sri Lanka (north of Vavuniya; *low risk* in other areas, see above):

chloroquine + proguanil hydrochloride *or* (if chloroquine + proguanil not appropriate) mefloquine *or* doxycycline *or* Malarone®

High risk Risk *high* and *chloroquine resistance high* in Bangladesh (only in Chittagong Hill Tracts; *low risk* in other areas, see above), India (Assam only; see also *low risk* and *variable risk* above):

mefloquine *or* doxycycline (if child over 12) *or* Malarone® *or* (if mefloquine, doxycycline, or Malarone® not appropriate) chloroquine + proguanil hydrochloride

South-East Asia

Very low risk Risk *very low* in Bali, Brunei, main tourist areas of China (but *substantial risk* in Yunnan and Hainan, see below; *chloroquine prophylaxis* appropriate for other remote areas), Hong Kong, Korea (both North and South), Malaysia (both East and West including Cameron Highlands, but *substantial risk* in Sabah [except Kota Kinabalu], and *variable risk* in deep forests, see below), Singapore, Thailand (Bangkok, main tourist centres, Chang Ri, Kwai Bridge—**important**: regional risk exists, see under *Great risk*, below), Vietnam (cities, coast between Ho Chi Minh and Hanoi, and Mekong River until close to Cambodian border; *substantial risk* in other areas, see below):

chemoprophylaxis not recommended but avoid mosquito bites and consider malaria if fever presents

Variable risk Risk *variable* and *some chloroquine resistance* in Indonesia (very low risk in Bali, and cities but *substantial risk* in Irian Jaya [West Papua] and Lombok, see below), rural Philippines below 600 m (no risk in cities, Cebu, Bohol, and Catanduanes), deep forests of peninsular Malaysia and Sarawak (but *substantial risk* in Sabah, see below):

chloroquine + proguanil hydrochloride *or* (if chloroquine + proguanil not appropriate) mefloquine *or* doxycycline *or* Malarone®

Substantial risk Risk *substantial* and *drug resistance common* in Cambodia (no risk in Phnom Penh; for western provinces, see below), China (Yunnan and Hainan; *chloroquine prophylaxis* appropriate for other remote areas; see also *Very low risk* above), East Timor, Irian Jaya [West Papua], Laos (no risk in Vientiane), Lombok, Malaysia (Sabah; see also *Very low risk* and *Variable risk* above), Myanmar (formerly Burma; see also *Great risk* below), Vietnam (*very low risk* in some areas, see above):

mefloquine *or* doxycycline (if child over 12) *or* Malarone®

Great risk and drug resistance present Risk *great and widespread chloroquine and mefloquine resistance present* in western provinces of Cambodia, borders of Thailand with Cambodia, Laos and Myanmar (*very low risk* in Chang Ri and Kwai Bridge, see above), Myanmar (eastern Shan State):

doxycycline (if child over 12) *or* Malarone®

Oceania

Risk Risk *high* and *chloroquine resistance high* in Papua New Guinea (below 1800 m), Solomon Islands, Vanuatu:

doxycycline (if child over 12) *or* mefloquine *or* Malarone®

Central and South America and the Caribbean

Variable to low risk Risk *variable to low* in Argentina (rural areas along northern borders only), rural Belize (except Belize district), Costa Rica (Limon Province except Puerto Limon and northern canton of Pococci), Dominican Republic, El Salvador (Santa Ana province in west), Guatemala (below 1500 m), Haiti, Honduras, Mexico (states of Oaxaca and Chiapas), Nicaragua, Panama (west of Panama Canal but *variable to high risk* east of Panama Canal, see below), rural Paraguay:

chloroquine *or* (if chloroquine not appropriate) proguanil hydrochloride

Variable to high risk Risk *variable to high and chloroquine resistance present* in rural areas of Bolivia (below 2500 m; see below for Amazon basin area), Ecuador

(below 1500 m; no malaria in Galapagos Islands and Guayaquil; see below for Esmeraldas Province), Panama (east of Panama Canal), Peru (rural areas east of the Andes and west of the Amazon basin area below 1500 m; see below for Amazon basin area), Venezuela (north of Orinoco river; *high risk* south of and including Orinoco river and Amazon basin area, see below; Caracas free of malaria):

chloroquine + proguanil hydrochloride *or* (if chloroquine + proguanil not appropriate) mefloquine *or* doxycycline (if child over 12) *or* Malarone®

High risk Risk *high* and *marked chloroquine resistance* in Bolivia (Amazon basin area; see also *variable to high risk* above), Brazil (throughout 'Legal Amazon' area which includes the Amazon basin area, Mato Grosso and Maranhao only; elsewhere *very low risk*—no chemoprophylaxis), Colombia (most areas below 800 m), Ecuador (Esmeraldas Province; *variable to high risk* in other areas, see above), French Guiana, all interior regions of Guyana, Peru (Amazon basin area; see also *variable to high risk* above), Suriname (except Paramaribo and coast), Venezuela (Amazon basin area, areas south of and including Orinoco river; see also *variable to high risk* above):

mefloquine *or* doxycycline (if child over 12) *or* Malarone®

Standby treatment [unlicensed]

Children and their carers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be **avoided** if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with **written instructions** that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Artemether with lumefantrine

Artemether with lumefantrine is licensed for the *treatment of acute uncomplicated falciparum malaria*.

ARTEMETHER WITH LUMEFANTRINE

Cautions electrolyte disturbances, concomitant use with other drugs known to cause QT-interval prolongation; monitor patients unable to take food (greater risk of recrudescence); **interactions:** Appendix 1 (artemether with lumefantrine)

Hepatic impairment manufacturer advises caution in severe impairment—monitor ECG and plasma potassium concentration

Renal impairment manufacturer advises caution in severe impairment—monitor ECG and plasma potassium concentration

Pregnancy toxicity in *animal* studies with artemether; manufacturer advises use only if potential benefit outweighs risk

Skilled tasks Dizziness may affect performance of skilled tasks

Contra-indications history of arrhythmias, of clinically relevant bradycardia, and of congestive heart failure accompanied by reduced left ventricular ejection fraction; family history of sudden death or of congenital QT interval prolongation

Breast-feeding Manufacturer advises avoid breast-feeding for at least 1 week after last dose; present in milk in *animal* studies

Side-effects abdominal pain, anorexia, diarrhoea, vomiting, nausea; palpitation, prolonged QT interval; cough; headache, dizziness, sleep disturbances, asthenia, paraesthesia; arthralgia, myalgia; pruritus, rash; *less commonly* ataxia, hypoaesthesia, clonus

◊ ARTEMETHER WITH LUMEFANTRINE (continued)

Indication and dose

Treatment of acute uncomplicated falciparum malaria see p. 395

Treatment of benign malaria see p. 396

Administration tablets may be crushed just before administration

Riamet® (Novartis) ▼ (P_M)

Tablets, yellow, artemether 20 mg, lumefantrine 120 mg, net price 24-tab pack = £22.50. Label: 21, counselling, skilled tasks

Chloroquine

Chloroquine is used for the *prophylaxis of malaria* in areas of the world where the *risk of chloroquine-resistant falciparum malaria is still low*. It is also used with proguanil when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see specific recommendations by country, p. 398).

Chloroquine is **no longer recommended** for the *treatment of falciparum malaria* owing to widespread resistance, nor is it recommended if the infective species is *not known* or if the infection is *mixed*; in these cases treatment should be with quinine, Malarone®, or Riamet® (for details, see p. 395). It is still recommended for the *treatment of benign malaria*s (for details, see p. 396).

CHLOROQUINE

Cautions moderate or severe hepatic impairment; may exacerbate psoriasis, neurological disorders (avoid for prophylaxis if history of epilepsy, see notes above), may aggravate myasthenia gravis, severe gastro-intestinal disorders, G6PD deficiency (see section 9.1.5); ophthalmic examination with long-term therapy; avoid concurrent therapy with hepatotoxic drugs—other **interactions**: Appendix 1 (chloroquine and hydroxychloroquine)

Renal impairment mild to moderate, reduce dose (but for malaria prophylaxis see, p. 398); severe, avoid (but for malaria prophylaxis see p. 398)

Pregnancy *first, third trimesters*: benefit of prophylaxis and treatment in malaria outweighs risk; **important**: see also Falciparum Malaria (Treatment), Benign Malaria (Treatment), and Prophylaxis Against Malaria

Breast-feeding amount probably too small to be harmful when used for malaria prophylaxis; inadequate for reliable protection against malaria in breast-fed infant, see p. 398; avoid breast-feeding when used for rheumatic diseases

Side-effects gastro-intestinal disturbances, headache; may hypotension, convulsions, visual disturbances, depigmentation or loss of hair, skin reactions (rashes, pruritus); rarely, bone-marrow suppression, hypersensitivity reactions such as urticaria and angioedema; other side-effects (not usually associated with malaria prophylaxis or treatment), see under Antimalarials, section 10.1.3; very toxic in **overdosage**—immediate advice from poisons centres essential (see also p. 41)

Indication and dose**Prophylaxis of malaria**• **By mouth**

Dose (expressed as chloroquine base) preferably started 1 week before entering endemic area and continued for 4 weeks after leaving (see notes above)

Child up to 12 weeks, body-weight under 6 kg
37.5 mg once weekly

Child 12 weeks–1 year, body-weight 6–10 kg
75 mg once weekly

Child 1–4 years, body-weight 10–16 kg
112.5 mg once weekly

Child 4–8 years, body-weight 16–25 kg 150 mg once weekly (or 155 mg once weekly if tablets used)

Child 8–13 years, body-weight 25–45 kg
225 mg once weekly (or 232.5 mg once weekly if tablets used)

Child over 13 years, body-weight over 45 kg
310 mg once weekly

Counselling Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return. For details, see notes above

Treatment of benign malaria see p. 396

Note Chloroquine doses in BNFC may differ from those in product literature

¹ **Avloclor®** (AstraZeneca) (P_M)

Tablets, scored, chloroquine phosphate 250 mg (≡ chloroquine base 155 mg). Net price 20-tab pack = £1.22. Label: 5, counselling, prophylaxis, see above

1. Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed

◻ CHLOROQUINE (continued)

¹Malarivon® (Wallace Mfg) (POM)

Syrup, chloroquine phosphate 80 mg/5 mL (= chloroquine base 50 mg/5 mL), net price 75 mL = £3.35. Label: 5, counselling, prophylaxis, see above

²Nivaquine® (Sanofi-Aventis)

Syrup, golden, chloroquine sulphate 68 mg/5 mL (= chloroquine base 50 mg/5 mL), net price 100 mL = £5.15. Label: 5, counselling, prophylaxis, see above

▲ With proguanil

For cautions and side-effects of proguanil see Proguanil; for dose see Chloroquine and Proguanil

Paludrine/Avloclor® (AstraZeneca)

Tablets, travel pack of 14 tablets of chloroquine phosphate 250 mg (= chloroquine base 155 mg) and 98 tablets of proguanil hydrochloride 100 mg, net price 112-tab pack = £8.79. Label: 5, 21, counselling, prophylaxis, see above

Mefloquine

Mefloquine is used for the *prophylaxis of malaria* in areas of the world where there is a *high risk of chloroquine-resistant falciparum malaria* (for details, see specific recommendations by country, p. 398).

Mefloquine is now rarely used for the *treatment of falciparum malaria* because of increased resistance. It is rarely used for the treatment of benign malarias because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

The CSM has advised that travellers should be informed about adverse reactions of mefloquine and, if they occur, medical advice should be sought on alternative antimalarials before the next dose is due; the patient information leaflet, which describes adverse reactions should always be provided when dispensing mefloquine.

MEFLOQUINE

Cautions cardiac conduction disorders; epilepsy (avoid for prophylaxis); not recommended in infants under 3 months (5 kg); **interactions:** Appendix 1 (mefloquine)

Hepatic impairment avoid for chemoprophylaxis in severe liver disease

Pregnancy (see Prophylaxis against Malaria, p. 398)—manufacturer advises **avoid** pregnancy during and for 3 months after (teratogenicity in animal studies)

Breast-feeding present in milk but risk to infant minimal

Skilled tasks Dizziness or a disturbed sense of balance may affect performance of skilled tasks; effects may persist for up to 3 weeks

Contra-indications hypersensitivity to quinine; avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions

Side-effects nausea, vomiting, diarrhoea, abdominal pain; dizziness, loss of balance, headache, sleep disorders (insomnia, drowsiness, abnormal dreams); *less commonly* circulatory disorders (hypotension and hypertension), chest pain, tachycardia, palpitation, bradycardia, cardiac conduction disorders, dyspnoea, fatigue, fever, loss of appetite, neuropsychiatric reactions (including sensory and motor neuropathies, tremor, ataxia, anxiety, depression, panic attacks, agitation, hallucinations, psychosis, convulsions), leucopenia or leucocytosis, thrombocytopenia, muscle weakness, myalgia, arthralgia, visual dis-

turbances, tinnitus and vestibular disorders, rash (including Stevens-Johnson syndrome), urticaria, pruritus, alopecia; *rarely* suicidal ideation; *very rarely* AV block, pneumonitis, and encephalopathy

Licensed use not licensed for use in children under 5 kg body-weight and under 3 months

Indication and dose

Prophylaxis of malaria preferably started 2½ weeks before entering endemic area and continued for 4 weeks after leaving (see notes above)

• By mouth

Child body-weight 5–16 kg 62.5 mg once weekly

Child body-weight 16–25 kg 125 mg once weekly

Child body-weight 25–45 kg 187.5 mg once weekly

Child body-weight over 45 kg 250 mg once weekly

Long-term chemoprophylaxis Mefloquine prophylaxis can be taken for up to 1 year

Counselling See CSM advice in notes above. Also warn travellers and carers of children travelling about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return. For details, see notes above

Note Mefloquine doses in BNFC may differ from those in product literature

1. Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed
2. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

▢ MEFLOQUINE (continued)

Administration Tablet may be crushed and mixed with food such as jam or honey just before administration

¹ **Lariam®** (Roche) (POM)

Tablets, scored, mefloquine (as hydrochloride) 250 mg. Net price 8-tab pack = £14.53. Label: 21, 25, 27, counselling, skilled tasks, prophylaxis, see above

Primaquine

Primaquine is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment (for details, see p. 396).

PRIMAQUINE

Cautions G6PD deficiency (test blood, see under Benign Malaria (treatment), p. 396); systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, lupus erythematosus); **interactions:** Appendix 1 (primaquine)

Pregnancy risk of neonatal haemolysis and methaemoglobinaemia in third trimester; see also Benign Malaria (treatment)

Side-effects nausea, vomiting, anorexia, abdominal pain; *less commonly* methaemoglobinaemia, haemolytic anaemia especially in G6PD deficiency, leucopenia

Licensed use not licensed

Indication and dose

Adjunct in the treatment of *Plasmodium vivax* and *P. ovale* malaria (eradication of liver stages) for dose see Benign Malaria, p. 396

Primaquine (Non-proprietary)

Tablets, primaquine (as phosphate) 7.5 mg or 15 mg Available from 'special-order' manufacturers or specialist importing companies, see p. 943

Proguanil

Proguanil is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria, (for details, see specific recommendations by country, p. 398).

Proguanil used alone is not suitable for the treatment of malaria; however, Malarone® (a combination of atovaquone with proguanil) is licensed for the treatment of acute uncomplicated falciparum malaria.

Malarone® is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Malarone® is also used as an alternative to mefloquine or doxycycline. Malarone® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

PROGUANIL HYDROCHLORIDE

Cautions **interactions:** Appendix 1 (proguanil)

Renal impairment (see notes under Prophylaxis against malaria). Use half normal dose if estimated glomerular filtration rate 20–60 mL/minute/1.73 m². Use one-quarter normal dose on alternate days if estimated glomerular filtration rate 10–20 mL/minute/1.73 m². Use one-quarter normal dose once weekly if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; increased risk of haematological toxicity.

Pregnancy benefit of prophylaxis in malaria outweighs risk. Adequate folate supplements should be given to mother; see also Prophylaxis Against Malaria

Breast-feeding amount probably too small to be harmful when used for malaria prophylaxis; inadequate for reliable protection against malaria in breast-fed infant

Side-effects mild gastric intolerance, diarrhoea, and constipation; occasionally mouth ulcers and

stomatitis; *very rarely* cholestasis, vasculitis, skin reactions and hair loss

Indication and dose

Prophylaxis of malaria preferably started 1 week before entering endemic area and continued for 4 weeks after leaving (see notes above)

• By mouth

Child up to 12 weeks, body-weight under 6 kg 25 mg once daily

Child 12 weeks–1 year, body-weight 6–10 kg 50 mg once daily

Child 1–4 years, body-weight 10–16 kg 75 mg once daily

Child 4–8 years, body-weight 16–25 kg 100 mg once daily

Child 8–13 years, body-weight 25–45 kg 150 mg once daily

1. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

□ PROGUANIL HYDROCHLORIDE (*continued*)

Child over 13 years, body-weight over 45 kg
200 mg once daily

Counselling Warn travellers and carers of children travelling about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return. For details, see notes above

Note Proguanil doses in BNFC may differ from those in product literature

Administration Tablets may be crushed and mixed with food such as milk, jam or honey just before administration

PROGUANIL HYDROCHLORIDE WITH ATOVAQUONE

Cautions diarrhoea or vomiting (reduced absorption of atovaquone); efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure); **interactions:** see Appendix 1 (proguanil, atovaquone)

Renal impairment avoid for malaria prophylaxis and, if possible for treatment, if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid unless essential

Breast-feeding use only if no suitable alternative available; see also Breast-feeding, p. 398

Side-effects abdominal pain, nausea, vomiting, diarrhoea; cough; headache, dizziness, insomnia, abnormal dreams, depression, anorexia, fever; rash, pruritus; *less frequently* mouth ulcers, stomatitis, anxiety, blood disorders, hyponatraemia, palpitation, and hair loss; also reported hepatitis, cholestasis, tachycardia, hallucinations, panic attacks, vasculitis, and Stevens-Johnson syndrome

Indication and dose

See preparations

Counselling Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return. For details, see notes above

¹Malarone® (GSK) ^(POM)

Tablets ('standard'), pink, f/c, proguanil hydrochloride 100 mg, atovaquone 250 mg. Net price 12-tab pack = £25.21. Label: 21, counselling, prophylaxis, see above

Dose

Prophylaxis of malaria started 1–2 days before entering endemic area and continued for 1 week after leaving

• By mouth

Child body-weight over 40 kg 1 tablet daily

¹Paludrine® (AstraZeneca)

Tablets, scored, proguanil hydrochloride 100 mg. Net price 98-tab pack = £7.43. Label: 21, counselling, prophylaxis, see above

■ With chloroquine

See under Chloroquine

Treatment of malaria

• By mouth

Child body-weight 11–21 kg 1 tablet daily for 3 days

Child body-weight 21–31 kg 2 tablets once daily for 3 days

Child body-weight 31–40 kg 3 tablets once daily for 3 days

Child body-weight over 40 kg 4 tablets once daily for 3 days

¹Malarone® Paediatric (GSK) ^(POM)

Paediatric tablets, pink, f/c proguanil hydrochloride 25 mg, atovaquone 62.5 mg, net price 12-tab pack = £6.26. Label: 21, counselling, prophylaxis, see above

Dose

Prophylaxis of malaria started 1–2 days before entering endemic area and continued for 1 week after leaving

• By mouth

Child body-weight 11–21 kg 1 tablet once daily

Child body-weight 21–31 kg 2 tablets once daily

Child body-weight 31–40 kg 3 tablets once daily

Child body-weight over 40 kg use *Malarone*® ('standard') tablets, see above

Treatment of malaria

• By mouth

Child body-weight 5–9 kg 2 tablets once daily for 3 days

Child body-weight 9–11 kg 3 tablets once daily for 3 days

Child body-weight 11 kg and over use *Malarone*® ('standard') tablets, see above

Administration tablets may be crushed and mixed with food or milky drink just before administration

Pyrimethamine

Pyrimethamine should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine is not recommended for the *prophylaxis of malaria*, but can be used in the treatment of *falciparum malaria* with (or following) *quinine*.

1. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

PYRIMETHAMINE WITH SULFADOXINE

Cautions see under Pyrimethamine (section 5.4.7) and under Co-trimoxazole (section 5.1.8); not recommended for prophylaxis (severe side-effects on long-term use); **interactions:** Appendix 1 (pyrimethamine, sulphonamides)

Pregnancy possible teratogenic risk in *first trimester* as pyrimethamine is a folate antagonist; in *third trimester*—risk of neonatal haemolysis and methaemoglobinaemia; fears of increased risk of neonatal kernicterus appear unfounded

Breast-feeding small risk of neonatal kernicterus in jaundiced infants; risk of haemolysis in G6PD-deficient child due to sulfadoxine

Contra-indications see under Pyrimethamine (section 5.4.7) and under Co-trimoxazole (section 5.1.8); sulphonamide allergy

Side-effects see under Pyrimethamine (section 5.4.7) and under Co-trimoxazole (section 5.1.8); pulmonary infiltrates (e.g. eosinophilic or allergic

alveolitis) reported—discontinue if cough or shortness of breath

Licensed use not licensed for use in children of body-weight under 5 kg

Indication and dose

Adjunct to quinine in treatment of *Plasmodium falciparum* malaria see p. 395

Prophylaxis not recommended by UK malaria experts

Pyrimethamine with sulfadoxine (Non-proprietary)

(P_M)

Tablets, scored, pyrimethamine 25 mg, sulfadoxine 500 mg, net price 3-tab pack = 74p

Note Also known as *Fansidar*[®]. Available from 'special-order' manufacturers or specialist importing companies, see p. 943

Quinine

Quinine is not suitable for the *prophylaxis of malaria*.

Quinine is used for the *treatment of falciparum malaria* or if the infective species is *not known* or if the infection is *mixed* (for details see p. 395).

QUININE

Cautions cardiac disease (including atrial fibrillation, conduction defects, heart block)—monitor ECG during parenteral treatment; monitor blood glucose and electrolyte concentration during parenteral treatment; G6PD deficiency (see section 9.1.5); **interactions:** Appendix 1 (quinine)

Renal impairment reduce parenteral maintenance dose for malaria treatment, see p. 396

Pregnancy risk of teratogenesis with high doses in *first trimester*; but in malaria benefit of treatment outweighs risk

Contra-indications haemoglobinuria, myasthenia gravis, optic neuritis, tinnitus

Side-effects cinchonism, including tinnitus, headache, hot and flushed skin, nausea, abdominal pain, rashes, visual disturbances (including temporary blindness), confusion; cardiovascular effects (see Cautions); hypersensitivity reactions including angioedema; hypoglycaemia (especially after parenteral administration); blood disorders (including thrombocytopenia and intravascular coagulation); acute renal failure; photosensitivity; very toxic in **overdosage**—immediate advice from poisons centres essential (see also p. 41)

Licensed use injection not licensed

Indication and dose

Treatment of malaria see p. 395

Note Quinine (anhydrous base) 100 mg = quinine bisulphate 169 mg = quinine dihydrochloride 122 mg = quinine hydrochloride 122 mg = quinine sulphate 121 mg. Quinine bisulphate 300-mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulphate

Administration for intravenous infusion, dilute to a concentration of 2 mg/mL (max. 30 mg/mL in fluid restriction) with Glucose 5% or Sodium Chloride 0.9% and give over 4 hours

Quinine Sulphate (Non-proprietary) (P_M)

Tablets, coated, quinine sulphate 200 mg, net price 28-tab pack = £1.95; 300 mg, 28-tab pack = £1.88

Quinine Dihydrochloride (Non-proprietary) (P_M)

Injection, quinine dihydrochloride 300 mg/mL. For dilution and use as an infusion. 1- and 2-mL amps Available from 'special-order' manufacturers or specialist importing companies, see p. 943

Note Intravenous injection of quinine is so hazardous that it has been superseded by infusion

Tetracyclines

Doxycycline (section 5.1.3) is used in children over 12 years for the *prophylaxis of malaria* in areas of *widespread mefloquine or chloroquine resistance*. Doxycycline is also used as an alternative to mefloquine or *Malarone*[®] (for details, see specific recommendations by country, p. 398).

Doxycycline is also used as an *adjunct to quinine in the treatment of falciparum malaria* (for details see p. 395).

DOXYCYCLINE**Cautions** section 5.1.3**Contra-indications** section 5.1.3**Side-effects** section 5.1.3**Licensed use** not licensed for use in children under 12 years**Indication and dose**

Prophylaxis of malaria preferably started 1–2 days before entering endemic area and continued for 4 weeks after leaving (see notes above)

- **By mouth**

Child over 12 years 100 mg once daily

Treatment of falciparum malaria see p. 395

■ **Preparations**

Section 5.1.3

5.4.2 Amoebicides

Metronidazole is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* which can cause ulceration of the large intestine. **Tinidazole** is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For *amoebic abscesses* of the liver **metronidazole** is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with large volume of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

DILOXANIDE FUROATE**Contra-indications**

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects flatulence, vomiting, urticaria, pruritus

Licensed use not licensed for use in children under 25 kg body-weight

Indication and dose

Chronic amoebiasis and as adjunct to metronidazole or tinidazole in acute amoebiasis

- **By mouth**

Child 1 month–12 years 6.6 mg/kg 3 times daily for 10 days

Child 12–18 years 500 mg 3 times daily for 10 days

Diloxanide (Sovereign) (POM)

Tablets, diloxanide furoate 500 mg, net price 30-tablet pack = £42.95. Label: 9

■ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

METRONIDAZOLE**Cautions** section 5.1.11**Side-effects** section 5.1.11**Indication and dose****Anaerobic infections** section 5.1.11**Invasive intestinal amoebiasis**• **By mouth****Child 1–3 years** 200 mg 3 times daily for 5 days**Child 3–7 years** 200 mg 4 times daily for 5 days**Child 7–10 years** 400 mg 3 times daily for 5 days**Child 10–18 years** 800 mg 3 times daily for 5 days**Extra-intestinal amoebiasis (including liver abscess)**• **By mouth****Child 1–3 years** 100–200 mg 3 times daily for 5–10 days**Child 3–7 years** 100–200 mg 4 times daily for 5–10 days**Child 7–10 years** 200–400 mg 3 times daily for 5–10 days**Child 10–18 years** 400–800 mg 3 times daily for 5–10 days**Urogenital trichomoniasis**• **By mouth****Child 1–3 years** 50 mg 3 times daily for 7 days**Child 3–7 years** 100 mg twice daily for 7 days**Child 7–10 years** 100 mg 3 times daily for 7 days**Child 10–18 years** 200 mg 3 times daily for 7 days or 400–500 mg twice daily for 5–7 days, or 2 g as a single dose**Giardiasis**• **By mouth****Child 1–3 years** 500 mg once daily for 3 days**Child 3–7 years** 600–800 mg once daily for 3 days**Child 7–10 years** 1 g once daily for 3 days**Child 10–18 years** 2 g once daily for 3 days or 400 mg 3 times daily for 5 days or 500 mg twice daily for 7–10 days■ **Preparations**

Section 5.1.11

TINIDAZOLE**Cautions** see under Metronidazole (section 5.1.11); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (tinidazole)**Pregnancy** manufacturer advises avoid in first trimester**Breast-feeding** present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment**Side-effects** see under Metronidazole (section 5.1.11)**Licensed use** licensed for use in children (age range not specified by manufacturer)**Indication and dose****Intestinal amoebiasis**• **By mouth****Child 1 month–12 years** 50–60 mg/kg (max. 2 g) once daily for 3 days**Child 12–18 years** 2 g once daily for 2–3 days**Amoebic involvement of liver**• **By mouth****Child 1 month–12 years** 50–60 mg/kg (max. 2 g) once daily for 5 days**Child 12–18 years** 1.5–2 g once daily for 3–6 days**Urogenital trichomoniasis and giardiasis**• **By mouth****Child 1 month–12 years** single dose of 50–75 mg/kg (max. 2 g) (repeated once if necessary)**Child 12–18 years** single dose of 2 g (repeated once if necessary)**Fasigyn®** (Pfizer) (POM)

Tablets, f/c, tinidazole 500 mg. Net price 20-tab pack = £13.80. Label: 4, 9, 21, 25

5.4.3 Trichomonacides**Metronidazole** (section 5.4.2) is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, **tinidazole** (section 5.4.2) may be tried.**5.4.4 Antigiardial drugs****Metronidazole** (section 5.4.2) is the treatment of choice for *Giardia lamblia* infections. **Tinidazole** (section 5.4.2) may be used as an alternative to metronidazole.

5.4.5 Leishmaniases

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate, an organic pentavalent antimony compound, is the treatment of choice for visceral leishmaniasis. The dose is 20 mg/kg daily (max. 850 mg) for at least 20 days by intramuscular or intravenous injection; the dosage varies with different geographical regions and expert advice should be obtained. Skin lesions can also be treated with sodium stibogluconate.

Amphotericin is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*AmBisome*[®]—section 5.2) at a dose of 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg or at a dose of 3 mg/kg for 5 consecutive days followed by a single dose of 3 mg/kg 6 days later. Other lipid formulations of amphotericin (*Abelcet*[®] and *Amphocil*[®]) are also likely to be effective but less information is available.

Pentamidine isetionate (pentamidine isethionate) (section 5.4.8) has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed], available from 'special-order' manufacturers or specialist importing companies, see p. 943

SODIUM STIBOGLUCONATE

Cautions intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain; mucocutaneous disease (see below); monitor ECG before and during treatment; heart disease (withdraw if conduction disturbances occur); treat intercurrent infection (e.g. pneumonia)

Hepatic impairment use with caution in hepatic disease

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding amount probably too small to be harmful

Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid

Contra-indications

Renal impairment manufacturer advises avoid in severe impairment

Side-effects anorexia, nausea, vomiting, abdominal pain; ECG changes; coughing (see Cautions); headache, lethargy, arthralgia, myalgia; rarely jaundice, flushing, bleeding from nose or gum, substernal pain (see Cautions), vertigo, fever, sweating, and rash; also reported pancreatitis and anaphylaxis; pain and thrombosis on intravenous administration, intramuscular injection also painful

Licensed use licensed for use in children (age range not specified by manufacturer)

Indication and dose

Leishmaniasis for dose, see notes above

Administration injection should be filtered immediately before administration using a filter of 5 microns or less; see also Cautions above

Pentostam[®] (GSK) (POM)

Injection, sodium stibogluconate equivalent to pentavalent antimony 100 mg/mL. Net price 100-mL bottle = £66.43

5.4.6 Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

5.4.7 Drugs for toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are children with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of **pyrimethamine** and **sulfadiazine** (sulphadiazine), given for several weeks (expert advice **essential**). Pyrimethamine is a folate antagonist, and adverse

reactions to this combination are relatively common (folinic acid supplements (see p. 501) and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin or clarithromycin or azithromycin. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin may reduce the risk of transmission of maternal infection to the fetus. When there is evidence of placental or fetal infection, pyrimethamine may be given with sulfadiazine and folinic acid after the first trimester.

In neonates without signs of toxoplasmosis, but born to mothers known to have become infected, spiramycin is given while awaiting laboratory results. If toxoplasmosis is confirmed in the infant, pyrimethamine and sulfadiazine are given for 12 months, together with folinic acid.

PYRIMETHAMINE

Cautions blood counts required with prolonged treatment; history of seizures—avoid large loading doses; **interactions:** Appendix 1 (pyrimethamine)

Hepatic impairment manufacturer advises caution

Renal impairment manufacturer advises caution

Pregnancy theoretical teratogenic risk in first trimester (folate antagonist); adequate folate supplement should be given to mother

Breast-feeding present in milk—avoid breast-feeding during toxoplasmosis treatment; avoid other folate antagonists

Side-effects depression of haematopoiesis with high doses, rashes, insomnia

Licensed use not licensed for use in children under 5 years

Indication and dose

Toxoplasmosis in pregnancy (in combination with sulfadiazine and folinic acid (section 8.1)), see notes above

• **By mouth**

Child 12–18 years 50 mg once daily until delivery

Congenital toxoplasmosis (in combination with sulfadiazine and folinic acid (section 8.1)),

• **By mouth**

Neonate 1 mg/kg twice daily for 2 days, then 1 mg/kg once daily for 6 months, then 1 mg/kg 3 times a week for 6 months

Malaria no dose stated because not recommended alone

Daraprim® (GSK)  

Tablets, scored, pyrimethamine 25 mg. Net price 30-tab pack = £2.17

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

SPIRAMYCIN

Cautions cardiac disease, arrhythmias (including predisposition to QT interval prolongation)

Hepatic impairment use with caution

Breast-feeding present in breast milk

Contra-indications sensitivity to other macrolides

Side-effects gastro-intestinal disturbances including nausea, vomiting, diarrhoea; dizziness, headache; rash; hepatotoxicity; rarely, prolongation of QT interval, thrombocytopenia and vasculitis

Licensed use not licensed

Indication and dose

Toxoplasmosis in pregnancy see notes above

• **By mouth**

Child 12–18 years 1.5 g twice daily until delivery

Chemoprophylaxis of congenital toxoplasmosis

• **By mouth**

Neonate 50 mg/kg twice daily

Spiramycin (Non-proprietary)

Tablets, spiramycin 750 000 units (250 mg); 1.5 million units (500 mg); 3 million units (1 g)

Syrup, spiramycin 75 000 units/mL (25 mg/mL)

Note 3000 units = 1 mg spiramycin

Available from 'special-order' manufacturers or specialist importing companies, see p.943

SULFADIAZINE

Cautions see under Co-trimoxazole, section 5.1.8

Pregnancy risk of neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded

Breast-feeding small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants

Contra-indications see under Co-trimoxazole, section 5.1.8

Renal impairment use with caution; avoid in severe renal impairment; high risk of crystalluria

Side-effects see under Co-trimoxazole, section 5.1.8

Licensed use not licensed for use in toxoplasmosis

Indication and dose

Toxoplasmosis in pregnancy (in combination with pyrimethamine and folinic acid (section 8.1)), see notes above

- By mouth

Child 12–18 years 1 g 3 times daily until delivery

Congenital toxoplasmosis (in combination with pyrimethamine and folinic acid (section 8.1))

- By mouth

Neonate 50 mg/kg twice daily for 12 months

Sulfadiazine (Non-proprietary) (POM)

Tablets, sulfadiazine 500 mg, net price 56-tab pack = £57.15. Label: 9, 27

- ▶ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

5.4.8 Drugs for pneumocystis pneumonia

Pneumonia caused by *Pneumocystis jiroveci* (*Pneumocystis carinii*) occurs in immunosuppressed children; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment

Mild to moderate disease **Co-trimoxazole** (section 5.1.8) in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

A combination of **dapsone** with **trimethoprim** 5 mg/kg every 6–8 hours (section 5.1.8) is given by mouth for the treatment of mild to moderate disease [unlicensed indication] in children who cannot tolerate co-trimoxazole.

A combination of **clindamycin** (section 5.1.6) and **primaquine** (section 5.4.1) may be used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Inhaled **pentamidine isetionate** is sometimes used for mild disease. It is better tolerated than parenteral pentamidine but systemic absorption may still occur.

Severe disease **Co-trimoxazole** (section 5.1.8) in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. **Pentamidine isetionate** given by intravenous infusion is an alternative for children who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia (see Adjunctive Therapy below).

Adjunctive therapy In moderate to severe pneumocystis infections associated with HIV infection, prednisolone (section 6.3.2) is given by mouth in a dose of 2 mg/kg (max. 80 mg daily) for 5 days (alternatively, hydrocortisone may be given parenterally); the dose is then reduced over the next 16 days and then stopped. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all children with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised children. Prophylaxis

should continue until immunity recovers sufficiently. It should not be discontinued if the child has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Co-trimoxazole (section 5.1.8) by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. Co-trimoxazole may be used in infants born to mothers with a high risk of transmission of infection.

Intermittent inhalation of **pentamidine isetionate** is used for prophylaxis against pneumocystis pneumonia in children unable to tolerate co-trimoxazole. It is effective but children may be prone to extrapulmonary infection. Alternatively, **dapsone** can be used.

DAPSONE

Cautions cardiac or pulmonary disease; anaemia (treat severe anaemia before starting); susceptibility to haemolysis including G6PD deficiency (section 9.1.5); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (dapsone)

Pregnancy neonatal haemolysis and methaemoglobinaemia reported in third trimester; folic acid 5 mg daily should be given to mother throughout pregnancy

Breast-feeding haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient

Blood disorders On long-term treatment, children and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop

Side-effects haemolysis, methaemoglobinaemia, neuropathy, allergic dermatitis (rarely including toxic epidermal necrolysis and Stevens-Johnson syndrome), anorexia, nausea, vomiting, tachycardia, headache, insomnia, psychosis, hepatitis, agranulocytosis; dapsone syndrome (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis,

hepatitis, hypoalbuminaemia, psychosis and death)

Licensed use not licensed for treatment of *P. jiroveci* pneumonia; monotherapy not licensed for children for prophylaxis of *P. jiroveci* pneumonia

Indication and dose

Treatment of *Pneumocystis jiroveci* (*P. carinii*) pneumonia (in combination with trimethoprim)

• By mouth

Child 1 month–12 years 2 mg/kg (max. 100 mg) once daily

Child 13–18 years 100 mg once daily

Prophylaxis of *Pneumocystis jiroveci* (*P. carinii*) pneumonia

• By mouth

Child 1 month–18 years 2 mg/kg (max. 100 mg) once daily

Dapsone (Non-proprietary) ^(POM)

Tablets, dapsone 50 mg, net price 28-tab pack = £23.01; 100 mg 28-tab pack = £33.74. Label: 8

PENTAMIDINE ISETIONATE

Cautions risk of severe hypotension following administration (establish baseline blood pressure and administer with child lying down; monitor blood pressure closely during administration, and at regular intervals, until treatment concluded); hypokalaemia, hypomagnesaemia, coronary heart disease, bradycardia, history of ventricular arrhythmias, concomitant use with other drugs known to prolong Q-T interval; hypertension or hypotension; hyperglycaemia or hypoglycaemia; leucopenia, thrombocytopenia, or anaemia; carry out laboratory monitoring according to product literature; care required to protect personnel during handling and administration; **interactions:** Appendix 1 (pentamidine isetionate)

Hepatic impairment use with caution

Renal impairment reduce dose for pneumocystis pneumonia if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; consult product literature

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises avoid unless essential

Side-effects severe reactions, sometimes fatal, due to hypotension, hypoglycaemia, pancreatitis,

and arrhythmias; also leucopenia, thrombocytopenia, acute renal failure, hypocalcaemia; also reported: azotaemia, abnormal liver-function tests, anaemia, hyperkalaemia, nausea and vomiting, dizziness, syncope, flushing, hyperglycaemia, rash, and taste disturbances; Stevens-Johnson syndrome reported; on inhalation, bronchoconstriction (may be prevented by prior use of bronchodilators), cough and shortness of breath; discomfort, pain, induration, abscess formation, and muscle necrosis at injection site

Licensed use *nebuliser solution* not licensed for use in children

Indication and dose

***Pneumocystis jiroveci* (*Pneumocystis carinii*) pneumonia**

• By intravenous infusion

Child 1 month–18 years 4 mg/kg once daily for at least 14 days

• By inhalation of nebulised solution (using suitable equipment—consult product literature)

Child 1 month–18 years 600 mg once daily for 3 weeks; secondary prevention, 300 mg every 4 weeks or 150 mg every 2 weeks

□ PENTAMIDINE ISETIONATE (*continued*)

Visceral leishmaniasis (kala-azar, section 5.4.5)

- By deep intramuscular injection

Child 1–18 years 3–4 mg/kg on alternate days to max. total of 10 injections; course may be repeated if necessary

Cutaneous leishmaniasis

- By deep intramuscular injection

Child 1–18 years 3–4 mg/kg once or twice weekly until condition resolves (but see also section 5.4.5)

Trypanosomiasis

- By deep intramuscular injection or intravenous infusion

Child 1–18 years 4 mg/kg daily or on alternate days to total of 7–10 injections

Administration Direct intravenous injection should be avoided whenever possible and **never** given rapidly; intramuscular injections should be deep and preferably given into the buttock.

For *intravenous infusion*, reconstitute 300 mg with 3–5 mL Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes

Pentacarinat® (Sanofi-Aventis) (P_{oM})

Injection, powder for reconstitution, pentamidine isetionate, net price 300-mg vial = £30.45

Nebuliser solution, pentamidine isetionate, net price 300-mg bottle = £32.15

Caution in handling Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature

5.5 Anthelmintics

- 5.5.1 Drugs for threadworms
- 5.5.2 Ascariicides
- 5.5.3 Drugs for tapeworm infections
- 5.5.4 Drugs for hookworms
- 5.5.5 Schistosomicides
- 5.5.6 Filaricides
- 5.5.7 Drugs for cutaneous larva migrans
- 5.5.8 Drugs for strongyloidiasis

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

Birmingham	(0121) 424 0357
Scottish Centre for Infection and Environmental Health (registered users of Travax only)	(0141) 300 1100 (weekdays 2–4 p.m. only)
Liverpool	(0151) 708 9393
London	(020) 7387 9300 (treatment advice only)

5.5.1 Drugs for threadworms

(pinworms, *Enterobius vermicularis*)

Anthelmintics are effective in threadworm infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole is the drug of choice for treating threadworm infection in children over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

Piperazine is available in combination with sennosides as a single-dose preparation.

MEBENDAZOLE

Cautions interactions: Appendix 1 (mebendazole)

Pregnancy manufacturer advises avoid—toxicity in *animal* studies

Breast-feeding amount present in milk too small to be harmful but manufacturer advises avoid

Note The patient information leaflet in the *Vermox*® pack includes the statement that it is not suitable for women known to be pregnant or for children under 2 years

Side-effects *very rarely* abdominal pain, diarrhoea; convulsions (in infants) and rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) reported

Licensed use not licensed for use in children under 2 years

Indication and dose

Threadworms

• By mouth

Child 6 months–18 years 100 mg as a single dose; if reinfection occurs second dose may be needed after 2 weeks

Whipworms, roundworms (section 5.5.2), hookworms (section 5.5.4)

• By mouth

Child 1–18 years 100 mg twice daily for 3 days

1 **Mebendazole** (Non-proprietary) (POM)

Tablets, chewable, mebendazole 100 mg

1. Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg

Vermox® (Janssen-Cilag) (POM)

Tablets, orange, scored, chewable, mebendazole 100 mg. Net price 6-tab pack = £1.42

Suspension, mebendazole 100 mg/5 mL. Net price 30 mL = £1.65

PIPERAZINE

Cautions epilepsy

Hepatic impairment manufacturer advises avoid

Renal impairment use with caution; avoid in severe renal impairment; risk of neurotoxicity

Pregnancy not known to be harmful but manufacturer advises avoid in first trimester

Breast-feeding present in milk—manufacturer advises avoid breast-feeding for 8 hours after dose (express and discard milk during this time)

Note Packs on sale to the general public carry a warning to avoid in epilepsy, liver or kidney disease, and to seek medical advice in pregnancy

Side-effects nausea, vomiting, colic, diarrhoea, allergic reactions including urticaria, bronchospasm, and rare reports of arthralgia, fever, Stevens-Johnson syndrome and angioedema; rarely dizziness, muscular inco-ordination ('worm wobble'); drowsiness, nystagmus, vertigo, blurred vision, confusion and clonic contractions in children with neurological or renal abnormalities

Indication and dose

See under preparation, below

▲ **With sennosides**

For cautions, contra-indications, side-effects of senna see section 1.6.2

Pripsen® (Thornton & Ross)

Oral powder, piperazine phosphate 4 g, total sennosides (calculated as sennoside B) 15.3 mg/sachet. Net price two-dose sachet pack = £1.53. Label: 13

Dose

(Stirred into milk or water)

Threadworms

• By mouth

Child 3 months–1 year 1 level 2.5-mL spoonful as a single dose in the morning, repeated after 14 days

Child 1–6 years 1 level 5-mL spoonful as a single dose in the morning, repeated after 14 days

Child 6–18 years content of 1 sachet as a single dose (in the morning), repeated after 14 days

Roundworms first dose as for threadworms; repeat at monthly intervals for up to 3 months if reinfection risk

5.5.2 Ascaricides

(common roundworm infections)

Mebendazole (section 5.5.1) is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p.943) is an alternative. It is very well tolerated; mild nausea or vomiting has been reported in about 1% of treated patients.

Piperazine may be given in a single dose, see Piperazine, above.

LEVAMISOLE

Cautions epilepsy; juvenile idiopathic arthritis; Sjögren's syndrome

Hepatic impairment use with caution—dose adjustment may be necessary

Pregnancy embryotoxic in *animal* studies, avoid if possible

Breast-feeding no information available

Contra-indications blood disorders

◊ LEVAMISOLE (continued)

Side-effects nausea, vomiting, diarrhoea; dizziness, headache; on *prolonged treatment* taste disturbances, insomnia, convulsions, influenza-like syndrome, blood disorders, vasculitis, arthralgia, myalgia, rash

Licensed use not licensed

Indication and dose

Roundworm (*Ascaris lumbricoides*)

- By mouth

Child 1 month–18 years 2.5–3 mg/kg (max. 150 mg) as a single dose

Hookworm

- By mouth

Child 1 month–18 years 2.5 mg/kg (max. 150 mg) as a single dose repeated after 7 days if severe

Nephrotic syndrome (specialist supervision section 6.3.2)

- By mouth

Child 1 month–18 years 2.5 mg/kg (max. 150 mg) on alternate days

Levamisole (Non-proprietary) (POM)

Tablets, levamisole (as hydrochloride) 50 mg

Label: 4

Available from 'special-order' manufacturers or specialist importing companies, see p.943

5.5.3 Drugs for tapeworm infections

Taeniacides

Niclosamide [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p.943) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel [unlicensed] is available from Merck (*Cysticide*®); it is as effective as niclosamide and is given to children over 4 years of age as a single dose of 5–10 mg/kg after a light breakfast (or as a single dose of 25 mg/kg for *Hymenolepis nana*).

Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic children do not always require treatment. Surgical treatment remains the method of choice in many situations. **Albendazole** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p.943) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Albendazole is given to children over 2 years of age in a dose of 7.5 mg/kg twice daily (max. 400 mg twice daily) for 28 days followed by 14-day break and then repeated for up to 2–3 cycles. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

5.5.4 Drugs for hookworms (ancylostomiasis, necatoriasis)

Hookworms live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole (section 5.5.1) has a useful broad-spectrum activity, and is effective against hookworms. **Albendazole** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p.943) given as a single dose of 400 mg in children over 2 years, is an alternative. **Levamisole** is also effective (section 5.5.2).

5.5.5 Schistosomicides (bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck (*Cysticide*®) and is effective against all human schistosomes. In children over 4 years the dose is 20 mg/kg followed after 4–6 hours by a further dose of 20 mg/kg (20 mg/kg 3 times daily for one day for *S. japonicum* infections). No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

5.5.6 Filariacides

Diethylcarbamazine [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 943) is effective against microfilariae and adult worms of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in children over 1 month is commenced with a dose of diethylcarbamazine citrate 1 mg/kg in divided doses on the first day and increased gradually over 3 days to 6 mg/kg daily (3 mg/kg daily if child under 10 years) in divided doses; length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment. In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement (and specialist advice sought).

Ivermectin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 943) is very effective in *onchocerciasis* and it is now the drug of choice. In children over 5 years, a single dose of 150 micrograms/kg by mouth produces a prolonged reduction in microfilarial levels. Retreatment at intervals of 6 to 12 months depending on symptoms must be given until the adult worms die out. Reactions are usually slight and most commonly take the form of temporary aggravation of itching and rash. Diethylcarbamazine or suramin should no longer be used for onchocerciasis because of their toxicity.

5.5.7 Drugs for cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to **ivermectin**, **albendazole** or **tiabendazole** (thiabendazole) by mouth (all unlicensed and available from 'special-order' manufacturers or specialist importing companies, see p. 943).

5.5.8 Drugs for strongyloidiasis

Adult forms of *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. **Ivermectin** [unlicensed] in a dose of 200 micrograms/kg daily for 2 days is the treatment of choice for chronic *Strongyloides* infection in children over 5 years. **Albendazole** [unlicensed] is an alternative in children over 2 years given in a dose of 400 mg twice daily for 3 days, repeated after 3 weeks if necessary.

Both of these drugs are available from 'special-order' manufacturers or specialist importing companies, see p. 943.

For hormonal contraception, see section 7.3.

6.1 Drugs used in diabetes

- 6.1.1 Insulins
- 6.1.2 Oral antidiabetic drugs
- 6.1.3 Diabetic ketoacidosis
- 6.1.4 Treatment of hypoglycaemia
- 6.1.5 Treatment of diabetic nephropathy and neuropathy
- 6.1.6 Diagnostic and monitoring agents for diabetes mellitus

Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many subtypes, the two principle classes of diabetes are type 1 diabetes and type 2 diabetes.

Type 1 diabetes, (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), is due to a deficiency of insulin following autoimmune destruction of pancreatic beta cells and is the most common form of diabetes in children. Children with type 1 diabetes require administration of insulin.

Type 2 diabetes, (formerly referred to as non-insulin-dependent diabetes mellitus (NIDDM)), is rare in children but the incidence is increasing, particularly in adolescents, as obesity increases. It results from reduced secretion of insulin or from peripheral resistance to the action of insulin. Although children may be controlled on diet alone, many require oral antidiabetic drugs or insulin to maintain satisfactory control. There is limited information available on the use of oral anti-diabetic drugs in children (see section 6.1.2). In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity.

Maturity-onset diabetes of the young (MODY) describes a number of rare disease states, distinct from type 2 diabetes, that are also characterised by impaired glucose tolerance. A sulphonylurea such as gliclazide (p. 430) may be effective in certain forms of MODY.

Treatment of diabetes Treatment should be aimed at alleviating symptoms and minimising the risk of long-term complications (see below).

Diabetes is a strong risk factor for cardiovascular disease later in life. Other risk factors for cardiovascular disease (smoking, hypertension, obesity and hyperlipidaemia) should be addressed. The use of an ACE inhibitor (section 2.5.5.1) and of a lipid-regulating drug (section 2.12) can be beneficial in children with diabetes and a high cardiovascular disease risk. For reference to the use of an ACE inhibitor in the management of diabetic nephropathy, see section 6.1.5.

Prevention of diabetic complications Although rare, retinopathy, neuropathy and nephropathy can occur in children with diabetes. Screening for complications should begin 5 years after diagnosis of diabetes or from 12 years of age. Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy.

A measure of the total glycated (or glycosylated) haemoglobin (HbA_{1c}) or a specific fraction (HbA_{1c}) provides a good indication of long-term glycaemic control. The ideal HbA_{1c} concentration is between 6.5 and 7.5% but this cannot always be achieved, and for those using insulin there are significantly increased risks of severe hypoglycaemia.

Tight control of blood pressure in hypertensive children with type 2 diabetes may reduce mortality significantly and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation) (see also section 2.5).

Driving Information on the requirements for driving vehicles by individuals receiving treatment for diabetes is available in the BNF (section 6.1) or from the DVLA at www.dvla.gov.uk/medical.aspx.

6.1.1 Insulins

Insulin is a polypeptide hormone that plays a key role in the regulation of carbohydrate, fat, and protein metabolism. There are differences in the amino-acid sequence of animal insulins, human insulins, and the human insulin analogues.

gues. Human sequence insulin may be produced semisynthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, prb) or yeast (pyr).

Immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic than other insulin preparations, but no real advantage has been shown in trials.

Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the thighs, buttocks, or abdomen; absorption from a limb site can be increased if the limb is used in strenuous exercise after the injection. Generally, subcutaneous insulin injections cause few problems; fat hypertrophy does however occur and is a factor in poor glycaemic control. Fat hypertrophy can be minimised by using different injection sites in rotation. Local allergic reactions are rare.

Insulin should be given to all children with type 1 diabetes; it may also be needed to treat type 2 diabetes either when other methods cannot control the condition or during periods of acute illness or peri-operatively. Insulin is required in all instances of ketoacidosis (section 6.1.3), which can develop rapidly in children.

Management of diabetes with insulin The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the child or carer obsessive and to avoid disabling hypoglycaemia; close co-operation is needed between the child or carer and the medical team to achieve good control and thereby reduce the risk of complications. Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual child. Treatment should be started with several doses of short-acting insulin (soluble insulin or a rapid-acting insulin analogue) given throughout the day with a longer-acting insulin given once a day. Alternatively, for those who have difficulty with, or prefer not to use, multiple daily injection regimens or in whom such regimens fail to achieve adequate glycaemic control, a mixture of premixed short- and medium-acting insulins can be given twice daily. The dose of insulin is increased gradually taking care to avoid troublesome hypoglycaemia. The proportion of the short-acting soluble component can be increased in those with excessive postprandial hyperglycaemia.

Initiation of insulin may be followed by a partial remission phase or 'honeymoon period' when lower doses of insulin are required than are subsequently necessary to maintain glycaemic control.

Insulin preparations can be divided into 3 types:

- those of **short** duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-acting insulin analogues, insulin aspart, insulin glulisine, and insulin lispro (section 6.1.1.1);
- those with an **intermediate** action, e.g. isophane insulin (section 6.1.1.2); and
- those whose action is slower in onset and lasts for **long** periods, e.g. protamine zinc insulin, insulin detemir, and insulin glargine (section 6.1.1.2)

The duration of action of a particular type of insulin can vary from one child to another, and needs to be assessed individually.

Examples of insulin regimens

- Multiple injection regimen: either soluble insulin or a rapid-acting insulin before meals and long-acting insulin at bedtime; suitable for those who wish to have flexibility. Long-acting insulin analogues (insulin detemir or insulin glargine) may be useful for this regimen;
- Three-times-daily combination of soluble insulin and isophane insulin in the morning, soluble insulin or a rapid-acting insulin analogue only before evening meal, and isophane insulin or long-acting insulin analogue only at bedtime; suitable for children who have at least 2 hours between the last 2 injections of the day;
- Twice-daily mixture of soluble insulin and isophane insulin: either mixed before administration or given as a pre-mixed combination e.g. 30:70 of soluble insulin: isophane insulin;
- Twice-daily isophane insulin: soluble insulin is added when necessary;
- Continuous subcutaneous insulin infusion (see below).

Insulin requirements Most prepubertal children require around 0.6–0.8 units/kg/day of insulin after the initial temporary remission phase. Unless the child has a very sedentary life-style, a requirement for higher doses may indicate poor compliance, poor absorption of insulin from the injection site (e.g. because of lipohypertrophic sites), or the beginning of puberty. During puberty up to 1.5–2 units/kg/day of insulin may be required, especially during growth spurts. Around 1 year after menarche or after the growth spurt in boys, the dose may need to be adjusted to avoid excessive weight gain. Insulin requirements can be *increased* by infection, stress, and accidental or surgical trauma. Insulin requirements can be *reduced* in very active individuals and in those with renal or hepatic impairment, some endocrine disorders (e.g. Addison's disease, hypopituitarism) or coeliac disease. Insulin requirements should be assessed frequently in all these circumstances.

Pregnancy and breast-feeding During pregnancy and breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy. The short-acting insulin analogues, insulin aspart and insulin lispro, are not known to be harmful, and may be used during pregnancy and breast-feeding. The safety of long-acting insulin analogues in pregnancy has not been established, therefore isophane insulin is recommended where longer-acting insulins are needed.

Insulin administration Insulin is generally given by *subcutaneous injection* half-an-hour before a meal, except for rapid-acting insulins, which should be given immediately before, with, or even immediately after a meal (section 6.1.1.1). Injection devices ('pens') (section 6.1.1.3), which hold the insulin in a cartridge and meter the required dose, are convenient to use. The conventional syringe and needle is less popular with children and carers, but may be required for insulins not available in cartridge form.

For intensive insulin regimens multiple subcutaneous injections (3 to 4 times daily) are usually recommended.

Short-acting insulins (soluble insulin, insulin aspart, insulin glulisine, and insulin lispro) can also be given by *continuous subcutaneous infusion* using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique is appropriate only for children who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Children on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration or have it monitored by a carer, and have expert training, advice, and supervision from an experienced healthcare team.

NICE guidance

Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008)

Continuous subcutaneous insulin infusion is recommended as an option in children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
- whose glycaemic control remains inadequate (HbA_{1c} over 8.5%) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

Soluble insulin by the *intravenous route* is reserved for urgent treatment e.g. in diabetic ketoacidosis, and for fine control in serious illness and in the peri-operative period (see under Diabetes and Surgery, below).

Monitoring All carers and children need to be trained to monitor blood-glucose concentrations (section 6.1.6). Since blood-glucose concentrations vary substan-

tially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia. It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals), while accepting that on occasions, for brief periods, it will be above these values; efforts should be made to prevent the blood-glucose concentration from falling below 4 mmol/litre. Carers and children should be advised to look for 'peaks' and 'troughs' of blood glucose, and to adjust the insulin dosage only once or twice weekly. Overall it is ideal to aim for an HbA_{1c} (glycosylated haemoglobin) concentration of 6.5–7.5% or less (reference range 4–6%) but this is not always possible without causing disabling hypoglycaemia. Measurement of serum-fructosamine concentration can also be used for assessment of control; this is simpler and cheaper but the measurement of HbA_{1c} is generally more reliable.

The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided. The carbohydrate intake needs to be regulated and should be distributed throughout the day. Fine control of blood glucose can be achieved by moving portions of carbohydrate from one meal to another without altering the total intake.

Hypoglycaemia Hypoglycaemia is a potential problem for all children using insulin, and they and their carers should be given careful instruction on how to avoid it.

Loss of warning of hypoglycaemia is common among insulin-treated children and can be a serious hazard, especially for cyclists and drivers. Very tight control of diabetes lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; increase in the frequency of hypoglycaemic episodes reduces the warning symptoms experienced by the child.

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjustment of insulin type, dose, and frequency, together with suitable timing and quantity of meals and snacks.

Diabetes and surgery Children with type 1 diabetes should undergo surgery in centres with facilities for the care of children with diabetes.

Children with type 1 diabetes who require surgery:

- should be admitted to hospital for general anaesthesia;
- should receive insulin, even if they are fasting, to avoid ketoacidosis;
- should receive glucose infusion when fasting before an anaesthetic to prevent hypoglycaemia.

Elective surgery Surgery in children with diabetes is best scheduled early on the list, preferably in the morning. If glycaemic control is poor it is advisable to admit the child well in advance of surgery. On the *evening before surgery*, blood-glucose should be measured frequently, especially before meals and snacks and at bedtime; urine should be tested for ketones. The usual evening or bedtime insulin and bedtime snack should be given. Ketosis or severe hypoglycaemia require correction, preferably by overnight intravenous infusion (section 6.1.3 and section 6.1.4), and the surgery may need to be postponed.

For surgery scheduled for the morning, the usual morning dose of insulin should be omitted. Early on the day of the operation, intravenous infusion of fluids and insulin should be started (see Intravenous Fluids and Continuous Insulin Infusion below).

For surgery scheduled for the afternoon, one-third of the usual morning dose of insulin should be given in the morning as short-acting (or soluble) insulin. Intravenous fluids and insulin infusion should be started by midday.

For emergency surgery, intravenous fluids and an insulin infusion should be started immediately (see Intravenous Fluids and Continuous Insulin Infusion below). If ketoacidosis is present the recommendations for diabetic ketoacidosis should be followed (section 6.1.3).

For minor procedures that require fasting, a slight modification of the usual regimen may be all that is necessary e.g. for early morning procedures delay insulin and food until immediately after the procedure. In all cases the advice of a doctor or anaesthetist experienced in the management of children with diabetes should be sought.

Intravenous fluids and continuous insulin infusion Blood-glucose and plasma-electrolyte concentrations must be measured frequently in a child receiving intravenous support. Intravenous infusion should be continued until after the child starts to eat and drink. The following infusions should be used and adjusted according to the child's fluid and electrolyte requirements:

- Constant infusion of sodium chloride 0.45% and glucose 5% intravenous infusion together with potassium chloride 20 mmol/litre (provided that plasma-potassium concentration is not raised) at a rate determined by factors such as volume depletion and age; the amount of potassium chloride infused is adjusted according to plasma electrolyte measurements;
- Constant infusion of soluble insulin 1 unit/mL in sodium chloride 0.9% intravenous infusion initially at a rate of 0.025 units/kg/hour (up to 0.05 units/kg/hour if the child is unwell), then adjusted to blood-glucose concentration;
- Blood-glucose concentration should be maintained between 5 and 12 mmol/litre. If the glucose concentration falls below 5 mmol/litre, glucose 10% intravenous infusion may be required; conversely, if the glucose concentration persistently exceeds 15 mmol/litre, sodium chloride 0.9% intravenous infusion should be substituted;
- If the child develops overt hypoglycaemia (blood-glucose less than 3 mmol/litre) then the insulin infusion should be suspended for up to 30 minutes.

The usual subcutaneous insulin regimen should be started before the first meal (but the dose may need to be 10–20% higher than usual if the child is still bedbound or unwell) and the intravenous insulin infusion stopped 1 hour later. If glycaemic control is not adequately achieved, additional insulin can be given in the following ways:

- additional doses of soluble insulin at any of the 4 injection times (before meals or bedtime) *or*
- temporary addition of intravenous insulin infusion to subcutaneous regimen *or*
- complete reversion to intravenous insulin infusion (particularly if the child is unwell).

Neonatal diabetes Neonatal diabetes is a rare condition that presents with acidosis, dehydration, hyperglycaemia and rarely ketosis; it responds to continuous insulin infusion (0.02 to 0.125 units/kg/hour); the dose should be adjusted according to blood glucose concentrations. When the neonate is stable, treatment can be switched to subcutaneous insulin given once or twice a day. Treatment is normally required for 4–6 weeks in transient forms but may be required permanently in some cases.

Neonatal hyperglycaemia Newborn babies are relatively intolerant of glucose, especially in the first week of life and if premature. If intravenous glucose is necessary e.g. for total parenteral nutrition, infuse at a lower rate for 6–12 hours and the glucose intolerance should resolve. Insulin is not needed for such transient glucose intolerance, but may be needed if blood-glucose concentration is persistently high.

6.1.1.1 Short-acting insulins

Soluble insulin is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies and at the time of surgery. It can be given intravenously and intramuscularly, as well as subcutaneously.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 2 and 4 hours, and a duration of action of up to 8 hours.

When injected intravenously, soluble insulin has a very short half-life of only about 5 minutes and its effect disappears within 30 minutes.

The human insulin analogues, **insulin aspart**, **insulin glulisine**, and **insulin lispro**, have a faster onset (10–20 minutes) and shorter duration of action (2–5 hours) than soluble insulin; as a result, compared with soluble insulin, fasting and prandial blood-glucose concentrations are a little higher, postprandial blood-

glucose concentration is a little lower, and hypoglycaemia occurs slightly less frequently. There is no evidence to justify switching from conventional insulin to a human insulin analogue if glycaemic control is adequate; they should only be used in children in preference to soluble insulin when a fast onset of action is required, e.g. in very young children who refuse food and when timing of injections in relation to meals is difficult. They may also be useful in children susceptible to pre-lunch hypoglycaemia and those who eat late in the evening and are prone to nocturnal hypoglycaemia. Insulin aspart and insulin lispro can be administered by subcutaneous infusion (see Insulin Administration above). They can also be administered intravenously and can be used as alternatives to soluble insulin for diabetic emergencies and at the time of surgery.

INSULIN

(Insulin Injection; Neutral Insulin; Soluble Insulin)

A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0

Cautions see notes above; **interactions:** Appendix 1 (antidiabetics)

Renal impairment may need dose reduction; insulin requirements fall; compensatory response to hypoglycaemia is impaired

Pregnancy insulin requirements should be assessed frequently by an experienced diabetes physician; see also Pregnancy and Breast-feeding p. 420 above

Side-effects see notes above; transient oedema; local reactions and fat hypertrophy at injection site; rarely hypersensitivity reactions including urticaria, rash; overdose causes hypoglycaemia

Indication and dose

Hyperglycaemia, surgery in children with diabetes

- By intravenous infusion

Neonate 0.01–0.1 units/kg/hour, adjusted according to blood-glucose concentration, see also notes above

Child 1 month–18 years 0.025–0.1 units/kg/hour, adjusted according to blood-glucose concentration, see also notes above

Diabetes mellitus

- By subcutaneous injection

According to requirements (see notes above)
Note Rotate injection site to reduce local reactions and fat hypertrophy

Administration For *intravenous infusion*, dilute to a concentration of 1 unit/mL with Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

Neonatal intensive care, dilute 5 units to a final volume of 50 mL with infusion fluid; an intra-

venous infusion rate of 0.1 mL/kg/hour provides a dose of 0.01 units/kg/hour

Highly purified animal

Counselling Show container to child or carer and confirm the expected version is dispensed

Hypurin® Bovine Neutral (Wockhardt) (POM)

Injection, soluble insulin (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £18.48; cartridges (for *Autopen® Classic*) 5 × 3 mL = £27.72

Hypurin® Porcine Neutral (Wockhardt) (POM)

Injection, soluble insulin (porcine, highly purified) 100 units/mL. Net price 10-mL vial = £16.80; cartridges (for *Autopen® Classic*) 5 × 3 mL = £25.20

Human sequence

Counselling Show container to child or carer and confirm the expected version is dispensed

Actrapid® (Novo Nordisk) (POM)

Injection, soluble insulin (human, pyr) 100 units/mL. Net price 10-mL vial = £7.48

Note Not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle

Humulin S® (Lilly) (POM)

Injection, soluble insulin (human, prb) 100 units/mL. Net price 10-mL vial = £16.50; 5 × 3-mL cartridge (for *Autopen® Classic* or *HumaPen®*) = £28.12

Insuman® Rapid (Aventis Pharma) (POM)

Injection, soluble insulin (human, crb) 100 units/mL, net price 5 × 3-mL cartridge (for *OptiPen® Pro I*) = £23.43; 5 × 3-mL *Insuman® Rapid OptiSet®* prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £27.90

Note Not recommended for use in subcutaneous insulin infusion pumps

Mixed preparations

See Biphasic Isophane Insulin (section 6.1.1.2)

INSULIN ASPART

(Recombinant human insulin analogue)

Cautions see under Insulin; use only if benefit likely compared to soluble insulin

Pregnancy see under Insulin;

Side-effects see under Insulin

Indication and dose

Diabetes mellitus

- By subcutaneous injection

Immediately before meals or when necessary shortly after meals, according to requirements

- By subcutaneous infusion, intravenous injection or intravenous infusion

According to requirements

◊ INSULIN ASPART (continued)

Administration for intravenous infusion, dilute to a concentration of 0.05–1 unit/mL with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

NovoRapid® (Novo Nordisk) (POM)

Injection, insulin aspart (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial =

£17.27; *Penfill®* cartridge (for *Innovo®* and *NovoPen®* devices) 5 × 3-mL = £29.43; 5 × 3-mL *FlexPen®* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £32.00

Counselling Show container to child or carer and confirm the expected version is dispensed

INSULIN GLULISINE

(Recombinant human insulin analogue)

Cautions see under Insulin

Pregnancy see under Insulin

Side-effects see under Insulin

Licensed use not licensed for children under 6 years

Indication and dose

Diabetes mellitus

- **By subcutaneous injection**
Immediately before meals or when necessary shortly after meals, according to requirements
- **By subcutaneous infusion**
According to requirements

Apidra® (Sanofi-Aventis) ▼ (POM)

Injection, insulin glulisine (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £17.27; 5 × 3-mL cartridge (for *OptiPen® Pro 1* and *Autopen® 24*) = £29.45; 5 × 3-mL *OptiClik®* cartridge (for *OptiClik® Pen (PMS)*) = £31.50; 5 × 3-mL *Apidra® Optiset®* prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £29.45; 5 × 3-mL *Apidra® SoloStar®* prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £25.00

Counselling Show container to patient and confirm that patient is expecting the version dispensed

Note The *Scottish Medicines Consortium* (p. 4) has advised (October 2008) that *Apidra®* is accepted for restricted use within NHS Scotland for the treatment of children over 6 years with diabetes mellitus in whom the use of a short-acting insulin analogue is appropriate

INSULIN LISPRO

(Recombinant human insulin analogue)

Cautions see under Insulin; children under 12 years (use only if benefit likely compared to soluble insulin)

Pregnancy see under Insulin;

Side-effects see under Insulin

Indication and dose

Diabetes mellitus

- **By subcutaneous injection**
Shortly before meals or when necessary shortly after meals, according to requirements
- **By subcutaneous infusion, or intravenous injection, or intravenous infusion**
According to requirements

Administration For intravenous infusion, dilute to a concentration of 0.1–1 unit/mL with Glucose 5%

or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

Humalog® (Lilly) (POM)

Injection, insulin lispro (recombinant human insulin analogue) 100 units/mL. Net price 10-mL vial = £17.28; 5 × 3-mL cartridge (for *Autopen® Classic* or *HumaPen®*) = £29.46; 5 × 3-mL *Humalog®-Pen* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46; 5 × 3-mL *Humalog® KwikPen* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46

Counselling Show container to child or carer and confirm the expected version is dispensed

6.1.1.2 Intermediate- and long-acting insulins

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–35 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily. Soluble insulin can be mixed with intermediate and long-acting insulins (except insulin detemir and insulin glargine), essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin, see below).

Close monitoring of blood glucose is essential when introducing a change to the insulin regimen; the total daily dose as well as any concomitant treatment may need to be adjusted.

Isophane insulin is a suspension of insulin with protamine; it is of particular value for initiation of twice-daily insulin regimens. Isophane can be mixed with soluble insulin before injection but ready-mixed preparations may be more appropriate (**biphasic isophane insulin**, **biphasic insulin aspart**, or **biphasic insulin lispro**).

Insulin zinc suspension (30% amorphous, 70% crystalline) has a more prolonged duration of action.

Protamine zinc insulin is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is now rarely used.

Insulin detemir and **insulin glargine** are human insulin analogues with prolonged duration of action; insulin detemir is given once or twice daily and insulin glargine is given once daily. There is little evidence to justify switching from conventional intermediate- or long-acting insulin to a human insulin analogue if glycaemic control is adequate. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2008) has recommended that, if insulin is required in patients with type 2 diabetes, insulin glargine may be considered for those:

- who require assistance with injecting insulin *or*
- whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia *or*
- who would otherwise need twice-daily basal insulin injections in combination with oral antidiabetic drugs.

A trial of insulin glargine may be offered to those who have experienced significant nocturnal hypoglycaemia when treated with isophane insulin.

INSULIN DETEMIR

(Recombinant human insulin analogue—long-acting)

Cautions see under Insulin (section 6.1.1.1)

Pregnancy see under Insulin; limited evidence of safety

Side-effects see under Insulin (section 6.1.1.1)

Licensed use not licensed for use in children under 6 years

Indication and dose

Diabetes mellitus

- By subcutaneous injection

Child over 6 years According to requirements

Levemir® (Novo Nordisk) (Pm)

Injection, insulin detemir (recombinant human insulin analogue) 100 units/mL, net price 5 × 3-mL cartridge (for *NovoPen*® devices) = £39.00; 5 × 3-mL *FlexPen*® prefilled disposable injection device (range 1–60 units, allowing 1-unit dosage adjustment) = £39.00; 5 × 3-mL *Levemir InnoLet*® prefilled disposable injection devices (range 1–50 units, allowing 1-unit dosage adjustment) = £44.85

Counselling Show container to child or carer and confirm the expected version is dispensed

INSULIN GLARGINE

(Recombinant human insulin analogue—long acting)

Cautions see under Insulin (section 6.1.1.1)

Pregnancy see under Insulin; limited evidence of safety

Side-effects see under Insulin (section 6.1.1.1)

Licensed use not licensed for use in children under 6 years

Indication and dose

Diabetes mellitus

- By subcutaneous injection

According to requirements

Lantus® (Aventis Pharma) (Pm)

Injection, insulin glargine (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £26.00; 5 × 3-mL cartridge (for *OptiPen*® *Pro 1* and *Autopen*® 24) = £39.00; 5 × 3-mL *OptiClik*® cartridge (for *OptiClik*® *Pen* (Pm)) = £42.00; 5 × 3-mL *Lantus*® *OptiSet*® prefilled disposable injection

devices (range 2–40 units, allowing 2-unit dosage adjustment) = £39.00; 5 × 3-mL *Lantus*® *SoloStar*® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £42.00

Note The *Scottish Medicines Consortium* (p. 4) has advised (October 2002) that insulin glargine is accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin.

It is **not** recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

Counselling Show container to child or carer and confirm the expected version is dispensed

INSULIN ZINC SUSPENSION**(Insulin Zinc Suspension (Mixed)—long acting)**

A sterile neutral suspension of bovine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns)

Cautions see under Insulin (section 6.1.1.1)

Side-effects see under Insulin (section 6.1.1.1)

Biphasic insulins

Biphasic insulins are pre-mixed insulin preparations containing various combinations of short-acting (soluble) or rapid-acting (analogue) insulin and an intermediate-acting insulin.

The percentage of short-acting insulin varies from 10% to 50%. These preparations should be administered by subcutaneous injection up to 15 minutes before or soon after a meal.

BIPHASIC INSULIN ASPART

(Intermediate-acting insulin)

Cautions see under Insulin and Insulin Aspart (section 6.1.1.1)

Side-effects see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

Indication and dose

Diabetes mellitus

- By subcutaneous injection
Up to 10 minutes before or soon after a meal, according to requirements

BIPHASIC INSULIN LISPRO

(Intermediate-acting insulin)

Cautions see under Insulin and Insulin Lispro (section 6.1.1.1)

Side-effects see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

Indication and dose

Diabetes mellitus

- By subcutaneous injection
Up to 15 minutes before or soon after a meal, according to requirements

Humalog® Mix25 (Lilly) (POM)

Injection, biphasic insulin lispro (recombinant human insulin analogue), 25% insulin lispro, 75% insulin lispro protamine, 100 units/mL, net price 5 × 3-mL cartridge (for *Autopen® Classic* or *HumaPen®*) = £29.46; 5 × 3-mL prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.98; 5 × 3-mL *Humalog® Mix25 KwikPen* prefilled disposable injection

BIPHASIC ISOPHANE INSULIN

(Biphasic Isophane Insulin Injection—intermediate acting)

A sterile buffered suspension of either porcine or human insulin complexed with protamine sulphate (or another suitable protamine) in a solution of insulin of the same species

Cautions see under Insulin (section 6.1.1.1)

Side-effects see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

Indication and dose

Diabetes mellitus

- By subcutaneous injection
According to requirements

NovoMix® 30 (Novo Nordisk) (POM)

Injection, biphasic insulin aspart (recombinant human insulin analogue), 30% insulin aspart, 70% insulin aspart protamine, 100 units/mL, net price 5 × 3-mL *Penfill®* cartridges (for *Innovo®* and *NovoPen®* devices) = £29.43; 5 × 3-mL *FlexPen®* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £32.00

Counselling Show container to child or carer and confirm the expected version is dispensed; the proportions of the two components should be checked **carefully** (the order in which the proportions are stated may not be the same in other countries)

devices (range 1–60 units allowing 1-unit dosage adjustment) = £30.98

Counselling Show container to child or carer and confirm the expected version is dispensed; the proportions of the two components should be checked **carefully** (the order in which the proportions are stated may not be the same in other countries)

Humalog® Mix50 (Lilly) (POM)

Injection, biphasic insulin lispro (recombinant human insulin analogue), 50% insulin lispro, 50% insulin lispro protamine, 100 units/mL, net price 5 × 3-mL cartridge (for *Autopen® Classic* or *HumaPen®*) = £29.46; 5 × 3-mL prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46; 5 × 3-mL *Humalog® Mix50 KwikPen* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.98

Counselling Show container to child or carer and confirm the expected version is dispensed; the proportions of the two components should be checked **carefully** (the order in which the proportions are stated may not be the same in other countries)

▲ Highly purified animal

Counselling Show container to child or carer and confirm the expected version is dispensed; the proportions of the two components should be checked **carefully** (the order in which the proportions are stated may not be the same in other countries)

Humurin® Porcine 30/70 Mix (Wockhardt) (POM)

Injection, biphasic isophane insulin (porcine, highly purified), 30% soluble, 70% isophane, 100 units/mL. Net price 10-mL vial = £16.80; cartridges (for *Autopen® Classic*) 5 × 3 mL = £25.20

▲ Human sequence

Counselling Show container to child or carer and confirm the expected version is dispensed; the proportions of the

◀ BIPHASIC ISOPHANE INSULIN (continued)

two components should be checked **carefully** (the order in which the proportions are stated may not be the same in other countries)

Mixtard® 30 (Novo Nordisk) (POM)

Injection, biphasic isophane insulin (human, pyr), 30% soluble, 70% isophane, 100 units/mL. Net price 10-mL vial = £7.48; *Mixtard 30 Penfill*® cartridge (for *Innovo*® or *Novopen*® devices) 5 × 3 mL = £20.08; 5 × 3-mL *Mixtard 30 InnoLet*® pre-filled disposable injection devices (range 1–50 units allowing 1-unit dosage adjustment) = £19.87

Humulin M3® (Lilly) (POM)

Injection, biphasic isophane insulin (human, prb), 30% soluble, 70% isophane, 100 units/mL. Net price 10-mL vial = £16.50; 5 × 3-mL cartridge (for *Autopen*® *Classic* or *HumaPen*®) = £28.12

Insuman® Comb 15 (Aventis Pharma) (POM)

Injection, biphasic isophane insulin (human, crb), 15% soluble, 85% isophane, 100 units/mL, net

price 5 × 3-mL *Insuman*® *Comb 15 OptiSet*® pre-filled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £27.90

Insuman® Comb 25 (Aventis Pharma) (POM)

Injection, biphasic isophane insulin (human, crb), 25% soluble, 75% isophane, 100 units/mL, net price 5-mL vial = £5.84; 5 × 3-mL cartridge (for *OptiPen*® *Pro 1*) = £23.43; 5 × 3-mL *Insuman*® *Comb 25 OptiSet*® pre-filled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £27.90

Insuman® Comb 50 (Aventis Pharma) (POM)

Injection, biphasic isophane insulin (human, crb), 50% soluble, 50% isophane, 100 units/mL, net price; 5 × 3-mL cartridge (for *OptiPen*® *Pro 1*) = £23.43; 5 × 3-mL *Insuman*® *Comb 50 OptiSet*® pre-filled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £27.90

6.1.1.3 Hypodermic equipment

Carers and children should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

▲ Injection devices

Autopen® (Owen Mumford)

Injection device; *Autopen*® 24 (for use with Sanofi-Aventis 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2 unit dosage adjustment, max. 42 units (2 unit version), net price (both) = £15.55; *Autopen*® *Classic* (for use with Lilly and Wockhardt 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2 unit dosage adjustment, max. 42 units (2-unit version), net price (all) = £15.79

HumaPen® Luxura (Lilly)

Injection device, for use with *Humulin*® and *Humalog*® 3-mL cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £26.36 (available in burgundy and champagne)

HumaPen® Luxura HD (Lilly)

Injection device, for use with *Humulin*® and *Humalog*® 3-mL cartridges; allowing 0.5-unit dosage adjustment, max. 30 units, net price = £26.36

NovoPen® (Novo Nordisk)

Injection device; for use with *Penfill*® insulin cartridges; *NovoPen*® *Junior* (for 3-mL cartridges), allowing 0.5-unit dosage adjustment, max. 35 units, net price = £24.60 (available in green and yellow); *NovoPen*® 3 *Demi* (for 3-mL cartridges), allowing 0.5-unit dosage adjustment, max. 35 units, net price = £25.03; *NovoPen*® 4 (for 3-mL cartridges), allowing 1-unit dosage adjustment, max. 60 units, net price = £26.36 (available in silver and blue)

OptiClik® (Sanofi-Aventis)

Injection device, for use with *Lantus OptiClik*® insulin cartridges, allowing 1-unit dosage adjustment, max. 80 units, net price = £20.13 (available in blue and grey)

OptiPen® Pro 1 (Aventis Pharma)

Injection device, for use with *Insuman*® insulin cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £22.00

SQ-PEN® (Medical House)

Needle-free insulin delivery device for use with any 10-mL vial or any 3-mL cartridge of insulin, allowing 1-unit

dosage adjustment, max. 50 units, net price *starter pack* (*SQ-PEN*® device, 1 practice nozzle, 1 nozzle, 1 3-mL adaptor, 1 10-mL adaptor) = £147.83, *3-month consumables pack* for 10-mL adaptor (7 nozzles, 5 × 10-mL insulin vial adaptors) = £18.08, for 3-mL adaptor (7 nozzles, 15 × 3-mL insulin cartridge adaptors) = £30.82; *vial adaptor pack* (6 insulin vial adaptors) = £7.66, *cartridge adaptor pack* (6 insulin cartridge adaptors) = £7.66; nozzle pack (6 nozzles) = £10.03

▲ Lancets

Lancets—sterile, single use (Drug Tariff)

BD Micro-Fine®+ 100 = £3.16, 200 = £6.13; *Cleanlet Fine*® 100 = £3.19, 200 = £6.13; ¹*Finepoint*® 100 = £3.48; ¹*FreeStyle*® 200 = £6.89; ¹*GlucoMen*® Fine 100 = £3.48, 200 = £6.74; *Hypoguard Supreme*® 100 = £2.75; ¹*Microlet*® (formerly *Ascensia Microlet*®) 100 = £3.69, 200 = £7.03; ¹*Milward Steri-Let*®, 23 gauge, 100 = £3.00, 200 = £5.70, 28 gauge, 100 = £3.00, 200 = £5.70; *Monolet*® 100 = £3.28, 200 = £6.24; *Monolet*® *Extra* 100 = £3.28; *MPD Ultra Thin*®, 100 = £3.30, 200 = £6.50; *Multiclix*® 204 = £9.02; ¹*One Touch UltraSoft*® 100 = £3.56; ²*Softclix*® 200 = £7.20; ²*Softclix XL*® 50 = £1.80; *Thin Lancets*, 200 = £7.02; ¹*Unilet Comfortouch*® 100 = £3.60, 200 = £6.83; ¹*Unilet General Purpose Superlite*® 100 = £3.67, 200 = £6.96; *Unistik 3 Comfort*®, 28-gauge, 100 = £6.24, 200 = £12.20; *Unistik 3 Extra*®, 21-gauge, 100 = £6.24, 200 = £12.20; *Unistik 3 Normal*®, 23-gauge, 100 = £6.24, 200 = £12.20; *Universal*®, 200 = £6.32; *Vitrex Soft*®, 23-gauge, 100 = £3.00, 200 = £5.70; *Vitrex Gentle*® 28-gauge, 100 = £3.19, 200 = £6.13; *WaveSense Ultra-Thin*® 28-gauge, 200 = £6.90, 33-gauge, 200 = £6.90

Compatible finger-pricking devices (unless indicated otherwise, see footnotes), all (POM); *B-D Optimus*®, *Glucolet*®, *Monojector*®, *Penlet II*®, *Soft Touch*®

1. (POM) *Autolet*® and (POM) *Autolet Impression*® are also compatible finger-pricking devices
2. Use (POM) *Softclix*® finger-pricking device

▲ Needles

Hypodermic Needle, Sterile single use (Drug Tariff)

For use with reusable glass syringe, sizes 0.5 mm (25G), 0.45 mm (26G), 0.4 mm (27G). Net price 100-needle pack = £2.68

Brands include *Microlance*®, *Monoject*®

Needles for Prefilled and Reusable Pen Injectors (Drug Tariff)

Screw on, needle length 6.1 mm or less, net price 100-needle pack = £12.53; 6.2–9.9 mm, 100-needle pack = £8.89; 10 mm or more, 100-needle pack = £8.89
Brands include *BD Micro-Fine*®, *Comfort Point*®, *NovoFine*®, *Novofine Autocover*®, *Unifine*® *Pentips*
Snap on, needle length 6.1 mm or less, net price 100-needle pack = £12.02; 6.2–9.9 mm, 100-needle pack = £8.52; 10 mm or more, 100-needle pack = £8.52
Brands include *Penfine*®

▲ Syringes

Hypodermic Syringe (Drug Tariff)

Calibrated glass with Luer taper conical fitting, for use with U100 insulin. Net price 0.5 mL and 1 mL = £15.18
Brands include *Abcare*®

Pre-Set U100 Insulin Syringe (Drug Tariff)

Calibrated glass with Luer taper conical fitting, supplied with dosage chart and strong box, for blind patients. Net price 1 mL = £21.99

U100 Insulin Syringe with Needle (Drug Tariff)

Disposable with fixed or separate needle for single use or single patient-use, colour coded orange. Needle length 8 mm, diameters 0.33 mm (29G), 0.3 mm (30G), net price 10 (with needle), 0.3 mL = £1.35, 0.5 mL = £1.40; needle length 12 mm, diameters 0.45 mm (26G), 0.4 mm (27G), 0.36 mm (28G), 0.33 mm (29G), net price 10 (with needle), 0.3 mL = £1.45; 0.5 mL = £1.30; 1 mL = £1.29
Brands include *BD Micro-Fine*®, *Clinipak*®, *Insupak*®, *Monoject*® *Ultra*, *Omnikan*®, *Plastipak*®

▲ Accessories

Needle Clipping (Chopping) Device (Drug Tariff)

Consisting of a clipper to remove needle from its hub and container from which cut-off needles cannot be retrieved; designed to hold 1200 needles, not suitable for use with lancets. Net price = £1.32
Brands include *BD Safe-Clip*®

Sharpsguard (Drug Tariff)

Net price 1-litre sharpsbin = 85p

6.1.2 Oral antidiabetic drugs

6.1.2.1 Sulphonylureas

6.1.2.2 Biguanides

6.1.2.3 Other antidiabetic drugs

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the child fails to respond adequately to restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

In children, type 2 diabetes does not usually occur until adolescence and information on the use of oral antidiabetic drugs in children is limited. Treatment with oral antidiabetic drugs should be initiated under specialist supervision **only**; the initial dose should be at the lower end of the adult dose range and then adjusted according to response.

Metformin (section 6.1.2.2) is the oral antidiabetic drug of choice because there is most experience with this drug in children. If dietary changes and metformin do not control the diabetes adequately, either a sulphonylurea (section 6.1.2.1) or insulin (section 6.1.1) can be added.

Alternatively, oral therapy may be substituted with insulin.

When insulin is added to oral therapy, it is generally given at bedtime as isophane insulin, and when insulin replaces an oral regimen it is generally given as twice-daily injections of a biphasic insulin (or isophane insulin mixed with soluble insulin). Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain can be reduced if the insulin is given in combination with metformin.

Pregnancy and breast-feeding During pregnancy, women with either pre-existing or gestational diabetes may be treated with metformin [unlicensed use], either alone or in combination with insulin (section 6.1.1). Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth. Metformin can be continued during breast-feeding for those with pre-existing diabetes.

Other oral hypoglycaemic drugs, including sulphonylureas, are contra-indicated in pregnancy and breast-feeding.

6.1.2.1 Sulphonylureas

The sulphonylureas are not the first choice oral antidiabetics in children. They act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action. All can cause hypoglycaemia but this is uncommon and usually indicates excessive dosage. Sulphonylurea-induced hypoglycaemia can persist for many hours and must always be treated in hospital.

Sulphonylureas are considered for children in whom metformin is contra-indicated or not tolerated. Several sulphonylureas are available but experience in children is limited; choice is determined by side-effects and the duration of action as well as the child's age and renal function. The long-acting sulphonylureas chlorpropamide and glibenclamide are associated with a greater risk of hypoglycaemia and for this reason are generally avoided in children. Shorter-acting alternatives, such as **tolbutamide**, may be preferred.

Insulin therapy should be instituted temporarily during intercurrent illness (such as coma, infection, and trauma). Sulphonylureas should be omitted on the morning of surgery; insulin is often required because of the ensuing hyperglycaemia in these circumstances.

Sulphonylureas can be useful in the management of certain forms of maturity-onset diabetes of the young (MODY); there is most experience with gliclazide.

Cautions Sulphonylureas encourage weight gain and should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting; metformin (section 6.1.2.2) is considered the drug of choice in children.

Contra-indications Sulphonylureas should be avoided where possible in acute porphyria (section 9.8.2). They should not be used while breast-feeding and insulin therapy should be substituted during pregnancy. Sulphonylureas are contra-indicated in the presence of ketoacidosis.

Side-effects Side-effects of sulphonylureas are generally mild and infrequent and include gastro-intestinal disturbances such as nausea, vomiting, diarrhoea and constipation.

Sulphonylureas can occasionally cause a disturbance in liver function, which rarely leads to cholestatic jaundice, hepatitis, and hepatic failure. Hypersensitivity reactions can occur, usually in the first 6–8 weeks of therapy. They consist mainly of allergic skin reactions which progress rarely to erythema multiforme or exfoliative dermatitis, fever, and jaundice; photosensitivity has rarely been reported with chlorpropamide and glipizide. Blood disorders are also rare but include leucopenia, thrombocytopenia, agranulocytosis, pancytopenia, haemolytic anaemia, and aplastic anaemia.

GLIBENCLAMIDE

Cautions see notes above; **interactions:** Appendix 1 (antidiabetics)

Hepatic impairment increased risk of hypoglycaemia in severe liver disease; avoid or use small dose; can produce jaundice

Renal impairment avoid in severe impairment

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children

Indication and dose

Type 2 diabetes mellitus, maturity-onset diabetes of the young (specialist management only, see notes above)

- By mouth

Child 12–18 years initially 2.5 mg daily with or immediately after breakfast, adjusted according to response, max. 15 mg daily

Glibenclamide (Non-proprietary) (POM)

Tablets, glibenclamide 2.5 mg, net price 28-tab pack = 85p; 5 mg, 28-tab pack = 88p

GLICLAZIDE

Cautions see notes above; **interactions:** Appendix 1 (antidiabetics)

Hepatic impairment increased risk of hypoglycaemia in severe liver disease; avoid or use small dose; can produce jaundice

Renal impairment reduce initial dose and monitor closely; avoid in severe impairment

Contra-indications see notes above

Side-effects see notes above

Licensed use not licensed for use in children

Indication and dose

Type 2 diabetes mellitus, maturity-onset diabetes of the young (specialist management only, see notes above)

- By mouth

Child 12–18 years initially 20 mg once daily with breakfast, adjusted according to response; up to 160 mg as a single dose; max. 160 mg twice daily

GLICLAZIDE (continued)

Gliclazide (Non-proprietary) (POM)

Tablets, scored, gliclazide 80 mg, net price 28-tab pack = £1.07, 60-tab pack = £1.71

Brands include *DIAGLYK*[®]

Diamicon[®] (Servier) (POM)

Tablets, scored, gliclazide 80 mg, net price 60-tab pack = £4.56

TOLBUTAMIDE

Cautions see notes above; **interactions:** Appendix 1 (antidiabetics)

Hepatic impairment increased risk of hypoglycaemia in severe liver disease; avoid or use small dose; can produce jaundice

Renal impairment avoid if possible; if no alternative reduce dose and monitor closely

Contra-indications see notes above

Side-effects see notes above; also headache, tinnitus

Licensed use not licensed in children

Indication and dose

Type 2 diabetes mellitus (see notes above), **specialist management only**

• **By mouth**

Child 12–18 years 0.5–1.5 g (max. 2 g) daily in divided doses with or immediately after meals or as a single dose with or immediately after breakfast

Tolbutamide (Non-proprietary) (POM)

Tablets, tolbutamide 500 mg. Net price 28-tab pack = £1.51

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

6.1.2.2 Biguanides

Metformin, the only available biguanide, has a different mode of action from the sulphonylureas, and is not interchangeable with them. It exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

Metformin is the drug of first choice in children with type 2 diabetes, in whom strict dieting has failed to control diabetes. When the combination of strict diet and metformin treatment fails, other options to be considered under specialist management only, include:

- combining with insulin (section 6.1.1) but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night);
- combining with a sulphonylurea (section 6.1.2.1) (reports of increased hazard with this combination remain unconfirmed).

Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin on the morning of surgery and give insulin if required).

Hypoglycaemia does not usually occur with metformin; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.

Gastro-intestinal side-effects are initially common with metformin, and may persist in some children, particularly when high doses are given. A slow increase in dose may improve tolerability.

Very rarely, metformin can provoke lactic acidosis which is most likely to occur in children with renal impairment, see Lactic Acidosis below.

METFORMIN HYDROCHLORIDE

Cautions see notes above; determine renal function before treatment and once or twice annually during treatment; **interactions:** Appendix 1 (antidiabetics)

Lactic acidosis Metformin should be used cautiously in renal impairment because of the increased risk of lactic acidosis: it is contra-indicated in children with significant renal impairment. To reduce the risk of lactic acidosis, metformin should be stopped or temporarily withdrawn in

those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure, or hepatic impairment

Contra-indications ketoacidosis, use of iodine-containing X-ray contrast media (do not restart metformin until renal function returns to normal) and use of general anaesthesia (suspend met-

▢ METFORMIN HYDROCHLORIDE (continued)

formin on the morning of surgery and restart when renal function returns to normal)

Hepatic impairment see Lactic Acidosis above

Renal impairment see Lactic Acidosis above

Pregnancy used in pregnancy for both pre-existing and gestational diabetes—see also Pregnancy and Breast-feeding, p. 429; manufacturer advises avoid

Breast-feeding may be used during breast-feeding—see also Pregnancy and Breast-feeding, p. 429; manufacturer advises avoid

Side-effects anorexia, nausea, vomiting, diarrhoea (usually transient), abdominal pain, taste disturbance; rarely lactic acidosis (withdraw treatment), decreased vitamin-B₁₂ absorption, erythema, pruritus and urticaria; hepatitis also reported

Licensed use not licensed in children under 10 years

Indication and dose

Diabetes mellitus (see notes above) specialist supervision only

• By mouth

Child 8–10 years initially 200 mg once daily adjusted according to response at intervals of at least 1 week; max. 2 g daily in 2–3 divided doses

Child 10–18 years initially 500 mg once daily adjusted according to response at intervals of at least 1 week; max. 2 g daily in 2–3 divided doses

Metformin (Non-proprietary) (POM)

Tablets, coated, metformin hydrochloride 500 mg, net price 28-tab pack = 88p, 84-tab pack = £1.37; 850 mg, 56-tab pack = £1.24. Label: 21

Oral solution, sugar-free, metformin hydrochloride 500 mg/5 mL, net price 100 mL = £62.41. Label: 21
Brands include *Metsol*[®]

Glucophage[®] (Merck) (POM)

Tablets, f/c, metformin hydrochloride 500 mg, net price 84-tab pack = £2.88; 850 mg, 56-tab pack = £3.20. Label: 21

6.1.2.3 Other antidiabetic drugs

There is little experience of the use of **acarbose** in children. It has been used in older children; therapy should be initiated by an appropriate expert.

The use of nateglinide in combination with a sulphonylurea is generally reserved for the management of some subtypes of *maturity-onset diabetes of the young* or other syndromes of diabetes and requires specialist management.

6.1.3 Diabetic ketoacidosis

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis, published by the British Society of Paediatric Endocrinology and Diabetes¹, should be followed. Clinically well children who are dehydrated up to 5% usually respond to oral rehydration and subcutaneous insulin. For those who do not respond, or are clinically unwell, or are dehydrated by more than 5%, insulin and replacement fluids are best given by intravenous infusion.

To restore circulating volume, give 10 mL/kg **sodium chloride 0.9%** as a bolus, repeat as necessary up to a maximum of 30 mL/kg. Further fluid requirements should be given by intravenous infusion at a rate that corrects losses over 48 hours; initially use **sodium chloride 0.9%**, changing to **sodium chloride 0.45% and glucose 5%** after 6 hours if response is adequate and plasma sodium concentration is stable. **Potassium chloride** is included in the infusion unless anuria is suspected, adjust according to plasma-potassium concentration. Insulin infusion is necessary to switch off ketogenesis and reverse acidosis; it should not be started until at least 1 hour after the start of intravenous rehydration fluids. **Soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride 0.9%** intravenous infusion to a concentration of 1 unit/mL and infused at a rate of 0.1 units/kg/hour. Insulin is continued until the metabolic disturbance is brought under control. **Sodium bicarbonate** infusion (1.26% or 2.74%) is rarely necessary and is used only in cases of extreme acidosis (blood pH less than 6.9) and shock since the acid-base disturbance is normally corrected by the insulin.

Blood glucose is expected to decrease by about 5 mmol/litre/hour; if the response is inadequate the insulin infusion rate can be increased. If the rate of decrease exceeds 5 mmol/litre/hour or blood glucose falls to 14–17 mmol/litre, **glucose intravenous infusion 5% or 10%** should be added to the replacement fluids.

1. Available at www.bsped.org.uk

The insulin infusion rate can be reduced to no less than 0.05 units/kg/hour when blood-glucose concentration is 14–17 mmol/litre and blood pH is greater than 7.3 and a glucose infusion has been started (see above); it is continued until the child is ready to take food by mouth. Subcutaneous insulin can then be started. The insulin infusion should not be stopped until 1 hour after starting subcutaneous soluble or long-acting insulin or 10 minutes after starting subcutaneous insulin aspart, or insulin glulisine, or insulin lispro.

Hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma occurs rarely in children. Treatment is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion and slower rehydration may be required.

6.1.4 Treatment of hypoglycaemia

Prompt treatment of hypoglycaemia in children from any cause is essential as severe hypoglycaemia may cause subsequent neurological damage. Hyperinsulinism, fatty acid oxidation disorders and glycogen storage disease are less common causes of acute hypoglycaemia in children.

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from 2 teaspoons of sugar, 3 sugar lumps, *Glucogel*[®] (formerly known as *Hypostop*[®] Gel, glucose 10 g/25 g tube, available from BBI Healthcare), and non-diet versions of *Lucozade*[®] Energy Original 55 mL, *Coca-Cola*[®] 100 mL, and *Ribena*[®] Blackcurrant 18 mL (to be diluted). If necessary this can be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness or seizures is an emergency. **Glucagon**, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases blood-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon can be issued to parents or carers of insulin-treated children for emergency use in hypoglycaemic attacks. It is often advisable to prescribe it on an 'if necessary' basis for hospitalised insulin-treated children, so that it can be given rapidly by the nurses during a hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, 5 mL/kg of glucose intravenous infusion 10% (500 mg/kg of glucose) (section 9.2.2) can be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 50% is **not** recommended, as it is very viscous and hypertonic. Close monitoring is necessary, particularly in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Children whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs can persist for many hours.

Glucagon is not effective in the treatment of hypoglycaemia due to fatty acid oxidation or glycogen storage disorders.

Neonatal hypoglycaemia Neonatal hypoglycaemia at birth is treated with **glucose intravenous infusion 10%** given at a rate of 5 mL/kg/hour. An initial dose of 2.5 mL/kg over 5 minutes may be required if hypoglycaemia is severe enough to cause loss of consciousness or seizures. Mild asymptomatic persistent hypoglycaemia may respond to a single dose of **glucagon**. Glucagon has also been used in the short-term management of endogenous hyperinsulinism.

GLUCAGON

Cautions see notes above, insulinoma, glucagonoma; ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency; delayed hypoglycaemia when used as a diagnostic test—deaths reported (ensure a meal is eaten before discharge)

Contra-indications pheochromocytoma

Side-effects nausea, vomiting, diarrhoea, hypokalaemia, rarely hypersensitivity reactions

Licensed use unlicensed for growth hormone test and hyperinsulinism

□ **GLUCAGON** (continued)**Indication and dose****Hypoglycaemia associated with diabetes**

- By subcutaneous, intramuscular, or intravenous injection

Neonate 20 micrograms/kg

Child 1 month–2 years 500 micrograms

Child 2–18 years, body-weight less than 25 kg 500 micrograms; **body-weight over 25 kg** 1 mg

Endogenous hyperinsulinism

- By intramuscular or intravenous injection

Neonate 200 micrograms/kg (max. 1 mg) as a single dose

Child 1 month–2 years 1 mg as a single dose

- By continuous intravenous infusion

Neonate 1–18 micrograms/kg/hour, adjusted according to response (max. 50 micrograms/kg/hour)

Child 1 month–2 years 1–10 micrograms/kg/hour, increased if necessary

Administration Do not add to infusion fluids containing calcium—precipitation may occur

Diagnosis of growth hormone secretion specialist centre only (section 6.5.1)

- By intramuscular injection

Child 1 month–18 years 100 micrograms/kg (max. 1 mg) as a single dose; dose may vary, consult local guidelines

Beta-blocker poisoning, see p. 41

Note 1 unit of glucagon = 1 mg of glucagon

1 **Glucagen® HypoKit** (Novo Nordisk) (POM)

Injection, powder for reconstitution, glucagon (rys) as hydrochloride with lactose, net price 1-mg vial with prefilled syringe containing water for injection = £11.52

1. (POM) restriction does not apply where administration is for saving life in emergency

Chronic hypoglycaemia

Diazoxide is useful in the management of chronic hypoglycaemia due to excessive insulin secretion, either from a tumour involving the islets of Langerhans or from persisting hyperinsulinaemic hypoglycaemia of infancy (nesidioblastosis, see also glucagon above). Diazoxide has no place in the management of acute hypoglycaemia. **Chlorothiazide** 3–5mg/kg twice daily (section 2.2.1) reduces diazoxide-induced sodium and water retention and has the added benefit of potentiating the glycaemic effect of diazoxide.

If diazoxide and chlorothiazide fail to suppress excessive glucose requirements in chronic hypoglycaemia then **octreotide** or **nifedipine** (section 2.6.2) can be added. Octreotide suppresses secretion of growth hormone, but growth is unlikely to be affected in the long term.

DIAZOXIDE

Cautions ischaemic heart disease; monitor blood pressure, during prolonged use monitor white cell and platelet count, and regularly assess growth, bone, and psychological development; avoid the intravenous route if possible; extravasation can cause tissue necrosis and single doses of 300 mg have been associated with angina and cerebral and myocardial infarction; **interactions:** Appendix 1 (diazoxide)

Renal impairment increased sensitivity to hypotensive and hyperglycaemic effect; dose reduction may be required

Pregnancy prolonged use in second or third trimesters may produce alopecia and impaired glucose tolerance in neonate; inhibits uterine activity

Contra-indications see section 2.5.1

Side-effects anorexia, nausea, vomiting, hyperuricaemia, sodium and water retention, hyperglycaemia, hypotension, oedema, tachycardia, arrhythmias, extrapyramidal effects; hypertrichosis on prolonged treatment

Licensed use chronic intractable hypoglycaemia (for use in hypertensive crisis see section 2.5.1)

Indication and dose**Chronic intractable hypoglycaemia**

- By mouth or by intravenous injection

Neonate initially 5 mg/kg twice daily to establish response, adjust dose according to response; usual maintenance dose 1.5–3 mg/kg 2–3 times daily; up to 7 mg/kg 3 times daily may be required in some cases, higher doses unlikely to be beneficial

Child 1 month–18 years initially 1.7 mg/kg 3 times daily then adjusted according to response; usual maintenance dose 1.5–3mg/kg 2–3 times daily; up to 5 mg/kg 3 times daily may be required in some cases, higher doses unlikely to be beneficial

Eudemine® (UCB Pharma) (POM)

Tablets, diazoxide 50 mg. Net price 20 = £9.29

Injection, see section 2.5.1

- ▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

OCTREOTIDE

Cautions avoid abrupt withdrawal of short-acting octreotide—see Side-effects below; in insulinoma (risk of increased depth and duration of hypoglycaemia—monitor closely when initiating treatment and changing doses); diabetes mellitus (antidiabetic requirements may be reduced); monitor thyroid function on long-term therapy; **interactions:** Appendix 1 (octreotide)

Pregnancy possible effect on fetal growth, avoid unless benefit outweighs risk

Breast-feeding no information, avoid unless essential

Side-effects anorexia, nausea, vomiting, abdominal pain, bloating, flatulence, diarrhoea, and steatorrhoea; postprandial glucose tolerance may be impaired, rarely persistent hyperglycaemia with chronic administration; hypoglycaemia has also been reported; reduced gall bladder motility and bile flow; gallstones reported after long-term treatment; abrupt withdrawal of subcutaneous octreotide is associated with biliary colic and pancreatitis; pain and irritation at injection site—sites should be rotated; rarely, pancreatitis shortly after administration, altered liver function tests, hepatitis and transient alopecia

Licensed use not licensed in children

Indication and dose

Persistent hyperinsulinaemic hypoglycaemia unresponsive to diazoxide and glucose

- **By subcutaneous injection**

Neonate initially 2–5 micrograms/kg every 6–8 hours, adjusted according to response; up to 7 micrograms/kg every 4 hours may rarely be required

Child 1 month–18 years initially 1–2 micrograms/kg every 4–6 hours, dose adjusted according to response; up to 7 micrograms/kg every 4 hours may rarely be required

Bleeding from oesophageal or gastric varices

- **By continuous intravenous infusion**

Child 1 month–18 years 1 microgram/kg/hour, higher doses may be required initially; when no active bleeding reduce dose over 24 hours; usual max. 50 micrograms/hour

Administration *Intravenous infusion*, dilute with sodium chloride 0.9% to a concentration of 10–50%

Sandostatim® (Novartis) (PmL)

Injection, octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £3.72; 100 micrograms/mL, 1-mL amp = £6.99; 200 micrograms/mL 5-mL vial = £69.66; 500 micrograms/mL, 1-mL amp = £33.87

6.1.5 Treatment of diabetic nephropathy and neuropathy

Diabetic nephropathy

Regular review of diabetic children over 12 years of age should include an annual test for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (*Micral-Test II®* (UHS) or *Microbumintest®* (UHS)) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Microalbuminuria can occur transiently during puberty; if it persists (at least 3 positive tests) treatment with an ACE inhibitor (section 2.5.5.1) or an angiotensin-II receptor antagonist (section 2.5.5.2) under specialist guidance should be considered; to minimise the risk of renal deterioration, blood pressure should be carefully controlled (section 2.5).

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral anti-diabetic drugs; this effect is more likely during the first weeks of combined treatment and in children with renal impairment.

For the treatment of hypertension in diabetes, see section 2.5.

Diabetic neuropathy

Clinical neuropathy is rare in children whose diabetes is well controlled.

6.1.6 Diagnostic and monitoring agents for diabetes mellitus

Blood monitoring

Blood **glucose** monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Carers and children should be properly trained in the use of blood glucose monitoring systems and the appropriate action to take on the

results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Note In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the blood glucose level is high or if the child is unwell, blood **ketones** should be measured according to local guidelines in order to detect diabetic ketoacidosis (section 6.1.3). Children and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

▲ Test strips

Active® (Roche Diagnostics)

Reagent strips, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with *Glucotrend®* and *Accu-Chek® Active* meters only. Net price 50-strip pack = £14.76

Advantage Plus® (Roche Diagnostics)

Reagent strips, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with *Accu-Chek® Advantage* meter only. Net price 50-strip pack = £14.76

Ascensia® Autodisc (Bayer Diabetes Care)

Sensor discs, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with *Ascensia Breeze®* and *Ascensia Espirit® 2* meters only. Net price 5 × 10-disc pack = £14.62

Aviva® (Roche Diagnostics)

Sensor strips, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with *Accu-Chek® Aviva* meter only. Net price 50-strip pack = £14.49

BM-Accutest® (Roche Diagnostics)

Reagent strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with *Accutest®* meters only. Net price 50-strip pack = £14.31

Breeze 2® (Bayer Diabetes Care)

Sensor disks, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with the *Breeze 2®* meter only. Net price 5 × 10-disc pack = £14.34

Compact® (Roche Diagnostics)

Reagent strips, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with *Accu-Chek® Compact* and *Accu-Chek® Compact Plus* meters only. Net price 3 × 17-strip pack = £14.88

Contour® (Bayer Diabetes Care)

Sensor strips, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with *Contour®* meter only. Net price 50-strip pack = £14.45

Note Formerly *Ascensia® Microfill*

FreeStyle® (Abbott)

Sensor strips, for blood glucose monitoring, range 1.1–27.8 mmol/litre, for use with *FreeStyle®* meter only. Net price 50-strip pack = £14.62

FreeStyle Lite® (Abbott)

Sensor strips, for blood glucose monitoring, range 1.1–27.8 micromol/litre, for use with *FreeStyle® Lite* meter only. Net price 50-strip pack = £14.62

GlucoMen® (Menarini Diagnostics)

Sensor strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with *GlucoMen® Glyco* and *GlucoMen® PC* meters only. Net price 50-strip pack = £13.67

GlucoMen® LX (Menarini Diagnostics)

Sensor strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with *GlucoMen® LX* meter only. Net price 50-strip pack = £14.33

GlucoMen® Visio Sensor (Menarini Diagnostics)

Sensor strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with *GlucoMen® Visio* meter. Net price 50-strip pack = £14.53

Hypoguard® Supreme (Hypoguard)

Reagent strips, for blood glucose monitoring, range 2.2–27.7 mmol/litre, for use with *Hypoguard® Supreme* meters. Net price 50-strip pack = £12.00

MediSense G2® (Abbott)

Sensor strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with *MediSense Precision QID* meter only. Net price 50-strip pack = £13.67

MediSense® Soft-Sense Plus (Abbott)

Sensor strips, for blood glucose monitoring, range 1.7–25 mmol/litre, for use with *Optium Xceed®* meter only. Net price 50-strip pack = £14.52

One Touch® (LifeScan)

Reagent strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with *One Touch® II*, *Profile* and *Basic* meters only. Net price 50-strip pack = £14.37

One Touch® Ultra (LifeScan)

Sensor strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with *One Touch® Ultra*, *One Touch Ultra 2®*, *One Touch UltraSmart®* and *One Touch UltraEasy®* meters only. Net price 50-strip pack = £14.53

One Touch® Vita (LifeScan)

Sensor strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre for use with *One Touch® Vita* meter only. Net price 50-strip pack = £14.53

Optium® β-ketone test strips (Abbott)

Reagent Strips, for blood ketone monitoring, range 0–8.0 mmol/litre, for use with *Optium®* or *Optium Xceed®* meters only. Net price 10-strip pack = £19.55

Optium® Plus (Abbott)

Sensor strips (formerly *Medisense® Optium Plus*), for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with *Optium Xceed* meter only. Net price 50-strip pack = £14.53

PocketScan® (LifeScan)

Reagent strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with *PocketScan®* meter only. Net price 50-strip pack = £14.19

Prestige® (Home Diagnostics)

Reagent strips, for blood glucose monitoring, range 1.4–33.3 mmol/litre, for use with *Prestige®* meter only. Net price 50-strip pack = £14.23

TRUEone® (Home Diagnostics)

Sensor strips with meter, for blood glucose monitoring, range 1.1–33.3 mmol/litre. Meter built into top of sensor strip pot. Net price 50-strip and meter pack = £14.25

TRUEtrack® (Home Diagnostics)

Reagent strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with TRUEtrack® meter only. Net price 50-strip pack = £13.97

WaveSense Jazz® (WaveSense)

Reagent strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with WaveSense Jazz® meter only. Net price 50-strip pack = £14.45

▲ Meters

Accu-Chek® Aviva (Roche Diagnostics)

Meter, for blood glucose monitoring (for use with Aviva® test strips). Accu-Chek® Aviva system = £12.99

Accu-Chek® Compact Plus (Roche Diagnostics)

Meter, for blood glucose monitoring (for use with Compact Plus® test strips). Accu-Chek® Compact Plus system = £12.99

Breeze 2® (Bayer Diabetes Care)

Meter, for blood glucose monitoring (for use with Breeze 2® sensor discs) = £10.29

Contour® (Bayer Diabetes Care)

Meter, for blood glucose monitoring (for use with Ascensia® Microfill sensor strips) = £10.29

FreeStyle® (Abbott)

Meters, for blood glucose monitoring (for use with FreeStyle® and FreeStyle Lite® test strips). FreeStyle Lite® meter = £7.79; FreeStyle Freedom Lite® meter = £5.99

GlucoMen® LX (Menarini Diagnostics)

Meter, for blood glucose monitoring (for use with GlucoMen® LX sensor strips) = £12.99

GlucoMen® Visio (Menarini Diagnostics)

Meter, for blood glucose monitoring (for use with GlucoMen® Visio Sensor strips) = £12.99

Hypoguard® Supreme (Hypoguard)

Meters, for blood glucose monitoring (for use with Hypoguard® Supreme test strips). Hypoguard® Supreme Plus meter = £35.00; Hypoguard® Supreme Extra meter = £45.00

One Touch Ultra® 2 (LifeScan)

Meter, for blood glucose monitoring (for use with One Touch Ultra® sensor strips) = £12.99

One Touch UltraEasy® (LifeScan)

Meter, for blood glucose monitoring (for use with One Touch Ultra® sensor strips) = £12.99

One Touch UltraSmart® (LifeScan)

Meter, for blood glucose monitoring (for use with One Touch Ultra® sensor strips) = £19.99

One Touch® Vita (LifeScan)

Meter, for blood glucose monitoring (for use with One Touch® Vita sensor strips) = £16.99

Optium® Xceed (Abbott)

Meter, for blood glucose monitoring (for use with Medisense® Soft-Sense Plus, and Optium® Plus test strips) and for blood ketone monitoring (for use with Optium® β-ketone test strips). Net price starter pack = £9.00

Prestige® (Home Diagnostics)

Meter, for blood glucose monitoring (for use with Prestige® test strips) = £5.63

TRUEtrack® (Home Diagnostics)

Meter, for blood glucose monitoring (for use with TRUEtrack® test strips) = £5.63

WaveSense Jazz® (WaveSense)

Meter, for blood glucose monitoring (for use with WaveSense Jazz® reagent strips) = £24.99

Urinalysis

Tests for glucose range from reagent strips specific to glucose to reagent tablets which detect all reducing sugars. *Clinitest®* is rarely used now; *Clinistix®* is suitable for screening purposes only. It is rarely necessary for children to test themselves for ketones unless they become unwell—see also Blood Monitoring, p. 435.

Microalbuminuria can be detected with *Micral-Test II®* or *Microbumintest®* but this should be followed by confirmation in the laboratory, since false positive results are common.

▲ Glucose

Clinistix® (Bayer Diabetes Care)

Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £3.25

Clinitest® (Bayer Diabetes Care)

Reagent tablets, for detection of glucose and other reducing substances in urine. Net price 36-tab pack = £2.00

Diabur-Test 5000® (Roche Diagnostics)

Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £2.79

Diastix® (Bayer Diabetes Care)

Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £2.76

Medi-Test® Glucose (BHR)

Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £2.30

▲ Ketones

Ketostix® (Bayer Diabetes Care)

Reagent strips, for detection of ketones in urine. Net price 50-strip pack = £2.92

Ketur Test® (Roche Diagnostics)

Reagent strips, for detection of ketones in urine. Net price 50-strip pack = £2.68

▲ Protein

Albustix® (Bayer Diabetes Care)

Reagent strips, for detection of protein in urine. Net price 50-strip pack = £4.10

Medi-Test® Protein 2 (BHR)

Reagent strips, for detection of protein in urine. Net price 50-strip pack = £3.22

▲ Other reagent strips available for urinalysis include:

Combur-3 Test® (glucose and protein—Roche Diagnostics), *Clinitek Microalbumin®* (albumin and

creatinine—Bayer Diagnostics), *Ketodiasitix*® (glucose and ketones—Bayer Diagnostics), *Medi-Test Combi 2*® (glucose and protein—BHR), *Micral-Test II*® (albumin—Roche Diagnostics), *Micro-*

albustix® (albumin and creatinine—Bayer Diagnostics), *Microalbumintest*® (albumin—Bayer Diagnostics), *Uristix*® (glucose and protein—Bayer Diagnostics)

Oral glucose tolerance test

The oral glucose tolerance test is now rarely needed for the diagnosis of diabetes when symptoms of hyperglycaemia are present. However, it is used for the investigation of insulin resistance, glycogen storage disease, and excessive growth hormone secretion. A dose of 1.75 g/kg (max. 75 g) of anhydrous glucose is used. It is also used to establish the presence of gestational diabetes; this generally involves giving anhydrous glucose 75 g (equivalent to Glucose BP 82.5 g) by mouth to the fasting patient, and measuring blood-glucose concentrations at intervals. The appropriate amount of glucose should be given with 200–300 mL fluid. Alternatively anhydrous glucose 75 g can be given as 113 mL *Polycal*® (Nutricia Clinical) with extra fluid to administer a total volume of 200–300 mL.

6.2 Thyroid and antithyroid drugs

6.2.1 Thyroid hormones

6.2.2 Antithyroid drugs

6.2.1 Thyroid hormones

Thyroid hormones are used in hypothyroidism (juvenile myxoedema), and also in diffuse non-toxic goitre, congenital or neonatal hypothyroidism, and Hashimoto's thyroiditis (lymphadenoid goitre). Neonatal hypothyroidism requires prompt treatment to facilitate normal development.

Levothyroxine sodium (thyroxine sodium) is the treatment of choice for *maintenance* therapy.

Doses for congenital hypothyroidism and juvenile myxoedema should be titrated according to clinical response, growth assessment, and measurement of plasma thyroxine and thyroid-stimulating hormone concentrations. In congenital hypothyroidism higher initial doses (up to 15 micrograms/kg daily; max. 50 micrograms daily) may benefit mental development.

Liothyronine sodium has a similar action to levothyroxine but is more rapidly metabolised and has a more rapid effect; 20–25 micrograms is equivalent to approximately 100 micrograms of levothyroxine. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in *severe hypothyroid states* when a rapid response is desired.

Liothyronine by intravenous injection is the treatment of choice in *hypothyroid coma*. Adjunctive therapy includes intravenous fluids, hydrocortisone, and treatment of infection; assisted ventilation is often required.

LEVOTHYROXINE SODIUM

(Thyroxine sodium)

Cautions panhypopituitarism or predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine), cardiovascular disorders (pre-therapy ECG may be valuable), long-standing hypothyroidism, diabetes insipidus, diabetes mellitus (dose of anti-diabetic drugs including insulin may need to be increased); **interactions:** Appendix 1 (thyroid hormones)

Pregnancy dose adjustment may be necessary, monitor maternal serum thyrotrophin

Breast-feeding minimal amount present in breast milk; unlikely to affect tests for neonatal hypothyroidism

Contra-indications thyrotoxicosis

Side-effects usually at excessive dosage include diarrhoea, vomiting; anginal pain, arrhythmias, palpitation, tachycardia; tremor, restlessness, excitability, insomnia, headache, flushing, sweating, fever, heat intolerance, weight-loss, muscle cramp, and muscular weakness; transient hair loss; hypersensitivity reactions including rash, pruritus and oedema also reported

◊ LEVOTHYROXINE SODIUM (continued)

Indication and dose

Hypothyroidism (in cardiac disease reduce dose by 50% and increase more slowly)

Note Levothyroxine equivalent to 100 micrograms/m²/day can be used as a guide to the requirements in children

- **By mouth**

Neonate initially 10–15 micrograms/kg once daily (max. 50 micrograms daily), adjusted in steps of 5 micrograms/kg every 2 weeks or as necessary; usual maintenance dose 20–50 micrograms daily

Child 1 month–2 years initially 5 micrograms/kg once daily (max. 50 micrograms daily) adjusted in steps of 10–25 micrograms daily every 2–4 weeks until metabolism normalised; usual maintenance dose 25–75 micrograms daily

Child 2–12 years initially 50 micrograms once daily adjusted in steps of 25 micrograms daily every 2–4 weeks until metabolism normalised; usual maintenance dose 75–100 micrograms daily

Child 12–18 years initially 50 micrograms once daily adjusted in steps of 25–50 micrograms daily every 3–4 weeks until metabolism normalised; usual maintenance dose 100–200 micrograms daily

Levothyroxine (Non-proprietary) (POM)

Tablets, levothyroxine sodium 25 micrograms, net price 28-tab pack = £1.80; 50 micrograms, 28-tab pack = £1.10; 100 micrograms, 28-tab pack = £1.22
Brands include *Eltroxin*[®]

Oral solution, levothyroxine sodium 25 micrograms/5 mL, net price 100 mL = £42.75; 50 micrograms/5 mL, 100 mL = £44.90; 100 micrograms/5 mL, 100 mL = £52.75
Brands include *Evotrx*[®] (sugar-free)

LIOTHYRONINE SODIUM

(L-Tri-iodothyronine sodium)

Cautions see under Levothyroxine Sodium; also cardiovascular disease (dose reduction may be necessary); **interactions**: Appendix 1 (thyroid hormones)

Pregnancy does not cross the placenta in significant amounts; dose adjustments may be necessary, monitor maternal serum thyrotropin

Contra-indications see under Levothyroxine Sodium

Side-effects see under Levothyroxine Sodium

Licensed use unlicensed for use in children

Indication and dose

See Levothyroxine and notes above

Hypothyroidism

- **By mouth**

Child 12–18 years initially 10–20 micrograms daily gradually increased to 60 micrograms daily in 2–3 divided doses

- **By slow intravenous injection**
(replacement for oral levothyroxine)

Convert **daily** levothyroxine dose to liothyronine (see below) and give in 2–3 divided doses, adjusted according to response

Note 2 micrograms liothyronine equivalent to approx. 8 micrograms levothyroxine

Hypothyroid coma

- **By slow intravenous injection**

Child 1 month–12 years 2–10 micrograms every 12 hours or up to every 4 hours if necessary

Child 12–18 years 5–20 micrograms repeated every 12 hours or up to every 4 hours if necessary; *alternatively* initially 50 micrograms then 25 micrograms every 8 hours reducing to 25 micrograms twice daily

Liothyronine sodium (Goldshield) (POM)

Tablets, scored, liothyronine sodium 20 micrograms, net price 28-tab pack = £20.00

Triiodothyronine (Goldshield) (POM)

Injection, powder for reconstitution, liothyronine sodium (with dextran). Net price 20-microgram amp = £37.92

6.2.2 Antithyroid drugs

Antithyroid drugs are used for hyperthyroidism either to prepare children for thyroidectomy or for long-term management. In the UK carbimazole is the most commonly used drug. Propylthiouracil can be used in those who suffer sensitivity reactions to carbimazole as sensitivity is not necessarily displayed to both drugs. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Treatment in children should be undertaken by a specialist.

CSM warning (neutropenia and agranulocytosis)

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

1. Children and their carers should be asked to report symptoms and signs suggestive of infection, especially sore throat.
2. A white blood cell count should be performed if there is any clinical evidence of infection.
3. Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

Carbimazole or **propylthiouracil** are initially given in large doses to block thyroid function. This dose is continued until the child becomes euthyroid, usually after 4 to 8 weeks, and is then gradually reduced to a maintenance dose of 30–60% of the initial dose. Alternatively high-dose treatment is continued in combination with levothyroxine replacement (*blocking-replacement regimen*); this is particularly useful when dose adjustment proves difficult or relapse is a problem. Treatment is usually continued for 12 to 24 months. The blocking-replacement regimen is **not** suitable during pregnancy. Hypothyroidism should be avoided particularly during pregnancy as it can cause fetal goitre.

When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

Rashes and pruritus are common with carbimazole but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted. If a child on carbimazole develops a sore throat it should be reported immediately because of the rare complication of agranulocytosis (see CSM warning, above).

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (^{131}I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol (section 2.4) is useful for rapid relief of thyrotoxic symptoms and can be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but **atenolol** (section 2.4) is also used.

Thyrotoxic crisis ('thyroid storm') requires emergency treatment with intravenous administration of fluids, propranolol and hydrocortisone as sodium succinate, as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Neonatal hyperthyroidism is treated with carbimazole or propylthiouracil, usually for 8 to 12 weeks. In severe symptomatic disease iodine may be needed to block the thyroid and propranolol required to treat peripheral symptoms.

Pregnancy and breast-feeding Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen (see above) is **not** suitable. Both propylthiouracil and carbimazole cross the placenta and in high doses can cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy). Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate.

Carbimazole and propylthiouracil are present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used.

CARBIMAZOLE

Cautions

Hepatic impairment manufacturers advise caution in mild to moderate hepatic impairment; avoid in severe hepatic impairment

Pregnancy see notes above

Breast-feeding see notes above

Side-effects nausea, mild gastro-intestinal disturbances, taste disturbance, hepatic disorders (including hepatitis and jaundice), headache; fever, malaise; rash, pruritus, arthralgia; *rarely* myopathy, alopecia, bone marrow suppression (including pancytopenia and agranulocytosis, see **CSM warning** above), hypersensitivity reactions

Indication and dose

Hyperthyroidism (including Graves' disease), thyrotoxic crisis, thyrotoxicosis

• By mouth

Neonate initially 250 micrograms/kg 3 times daily until euthyroid then adjust as necessary (see notes above); higher initial doses (up to 1 mg/kg daily) are occasionally required, particularly in thyrotoxic crisis

Child 1 month–12 years initially 250 micrograms/kg (max. 10 mg) 3 times daily until

euthyroid then adjusted as necessary (see notes above); higher initial doses occasionally required, particularly in thyrotoxic crisis

Child 12–18 years initially 10 mg 3 times daily until euthyroid then adjusted as necessary (see notes above); higher initial doses occasionally required, particularly in thyrotoxic crisis

Counselling Warn child and carers to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops

Carbimazole (Non-proprietary) [POM]

Tablets, carbimazole 5 mg, net price 100-tab pack = £5.51; 20 mg, 100-tab pack = £19.12. Counselling, blood disorder symptoms

Neo-Mercazole® (Amdipharm) [POM]

Tablets, both pink, carbimazole 5 mg, net price 100-tab pack = £5.15; 20 mg, 100-tab pack = £19.12. Counselling, blood disorder symptoms

Administration tablets may be crushed in water and used immediately

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

IODINE AND IODIDE

Cautions not for long-term treatment

Pregnancy avoid if possible, neonatal goitre and hypothyroidism may occur

Contra-indications

Breast-feeding possibly concentrated in milk—avoid; risk of neonatal goitre and hypothyroidism

Side-effects hypersensitivity reactions including coryza-like symptoms, headache, lacrimation, conjunctivitis, pain in salivary glands, laryngitis, bronchitis, rashes; on prolonged treatment depression, insomnia, impotence; goitre in infants of mothers taking iodides

Indication and dose

See under preparation

Aqueous Iodine Oral Solution

(Lugol's Solution), iodine 5%, potassium iodide 10% in purified water, freshly boiled and cooled,

total iodine 130 mg/mL. Net price 100 mL = £1.19. Label: 27

Dose

Neonatal thyrotoxicosis

• By mouth

Neonate 0.05–0.1 mL 3 times daily

Thyrotoxicosis (pre-operative)

• By mouth

Neonate 0.1–0.3 mL 3 times daily

Child 1 month–18 years 0.1–0.3 mL 3 times daily

Thyrotoxic crisis

• By mouth

Child 1 month–1 year 0.2–0.3 mL 3 times daily

Administration Dilute well with milk or water

PROPYLTHIOURACIL

Cautions see under Carbimazole

Hepatic impairment consider dose reduction

Renal impairment estimated glomerular filtration rate 10–50 mL/minute/1.73 m², use 75% of normal dose; estimated glomerular filtration rate less than 10 mL/minute/1.73 m², use 50% of normal dose

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see under Carbimazole; leucopenia; rarely cutaneous vasculitis, thrombocytopenia, aplastic anaemia, hypoproteinaemia,

hepatitis, encephalopathy, hepatic necrosis, nephritis, lupus erythematosus-like syndromes

Licensed use not licensed for use in children under 6 years of age

Indication and dose

Hyperthyroidism (including Graves' disease), thyrotoxic crisis, thyrotoxicosis

• By mouth

Neonate initially 2.5–5 mg/kg twice daily until euthyroid then adjusted as necessary (see notes above); higher doses occasionally required, particularly in thyrotoxic crisis

▢ PROPYLTHIOURACIL (continued)

Child 1 month–1 year initially 2.5 mg/kg 3 times daily until euthyroid then adjusted as necessary (see notes above); higher doses occasionally required, particularly in thyrotoxic crisis

Child 1–5 years initially 25 mg 3 times daily until euthyroid then adjusted as necessary (see notes above); higher doses occasionally required, particularly in thyrotoxic crisis

Child 5–12 years initially 50 mg 3 times daily until euthyroid then adjusted as necessary (see notes above); higher doses occasionally required, particularly in thyrotoxic crisis

Child 12–18 years initially 100 mg 3 times daily administered until euthyroid then adjusted as necessary (see notes above); higher doses occasionally required, particularly in thyrotoxic crisis

Propylthiouracil (Non-proprietary) (PAM)

Tablets, propylthiouracil 50 mg. Net price 56-tab pack = £34.85

- ▀ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

PROPRANOLOL HYDROCHLORIDE

Cautions see section 2.4

Contra-indications see section 2.4

Side-effects see section 2.4

Licensed use see section 2.4

Indication and dose

Hyperthyroidism with autonomic symptoms, thyrotoxicosis, thyrotoxic crisis

- By mouth

Neonate initially 250–500 micrograms/kg every 6–8 hours, adjusted according to response

Child 1 month–18 years initially 250–500 micrograms/kg every 8 hours, then adjusted according to response; doses up to 1 mg/kg every 8 hours occasionally required, max. 40 mg every 8 hours

- By intravenous injection over 10 minutes

Neonate initially 20–50 micrograms/kg every 6–8 hours, adjusted according to response

Child 1 month–18 years initially 25–50 micrograms/kg (max. 5 mg) every 6–8 hours, adjusted according to response

▀ Preparations

See section 2.4

6.3 Corticosteroids

6.3.1 Replacement therapy

6.3.2 Glucocorticoid therapy

6.3.1 Replacement therapy

The adrenal cortex normally secretes hydrocortisone (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of **hydrocortisone** (section 6.3.2) and the mineralocorticoid **fludrocortisone**; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison's disease* or following adrenalectomy, **hydrocortisone** by mouth is usually required. This is given in 2–3 divided doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone.

In *acute adrenocortical insufficiency*, **hydrocortisone** is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9%.

In *hypopituitarism*, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine (section 6.2.1) and sex hormones (section 6.4) should be given as indicated by the pattern of hormone deficiency.

In *congenital adrenal hyperplasia*, the pituitary gland increases production of corticotropin to compensate for reduced formation of cortisol; this results in excessive adrenal androgen production. Treatment is aimed at suppressing corticotropin using hydrocortisone (section 6.3.2). Careful and continual dose titration is required to avoid growth retardation and toxicity; for this reason potent, synthetic glucocorticoids such as dexamethasone are usually reserved for use in adolescents. The dose is adjusted according to clinical response and measurement of adrenal androgens and 17-hydroxyprogesterone. Salt-losing forms of congenital adrenal hyperplasia (where there is a lack of aldosterone production) require mineralocorticoid replacement. Mineralocorticoid replacement may also be beneficial even when salt-losing symptoms are not evident.

FLUDROCORTISONE ACETATE

Cautions section 6.3.2; **interactions:** Appendix 1 (corticosteroids)

Contra-indications section 6.3.2

Side-effects section 6.3.2

Indication and dose

Mineralocorticoid replacement in adrenocortical insufficiency

- By mouth

Neonate initially 100 micrograms once daily, adjusted according to response; usual range 50–300 micrograms daily

Child 1 month–18 years initially 50–100 micrograms once daily; maintenance 50–300 micrograms once daily, adjusted according to response

Florinef® (Squibb) (P_{MI})

Tablets, scored, fludrocortisone acetate 100 micrograms. Net price 100-tab pack = £5.36. Label: 10, steroid card

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

Note Bioavailability uncertain, tablets may result in more reliable absorption and may be dispersed in water

6.3.2 Glucocorticoid therapy

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids below). The mineralocorticoid activity of **fludrocortisone** (section 6.3.1) is so high that its anti-inflammatory activity is of no clinical relevance. The table below shows equivalent anti-inflammatory doses.

Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 1 mg	≡ Betamethasone 150 micrograms
	≡ Cortisone acetate 5 mg
	≡ Deflazacort 1.2 mg
	≡ Dexamethasone 150 micrograms
	≡ Hydrocortisone 4 mg
	≡ Methylprednisolone 800 micrograms
	≡ Triamcinolone 800 micrograms

The relatively high mineralocorticoid activity of **cortisone** and **hydrocortisone**, and the resulting fluid retention, make them unsuitable for disease suppression on a long-term basis. However, they can be used for adrenal replacement therapy (section 6.3.1); hydrocortisone is preferred because cortisone requires conversion in the liver to hydrocortisone. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked (section 13.4); cortisone is not active topically.

Prednisolone has predominantly glucocorticoid activity and is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone and **dexamethasone** have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion. Some esters of betamethasone and of **beclometasone** (beclometasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort has a high glucocorticoid activity; it is derived from prednisolone.

Use of corticosteroids

Dosages of corticosteroids vary widely in different diseases and in different children. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin (section 13.4). Corticosteroids should be avoided or used only under specialist supervision in psoriasis (section 13.5).

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease (section 1.5 and section 1.7.2).

Use can be made of the mineralocorticoid activity of fludrocortisone to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, low-dose hydrocortisone can be used in septic shock (section 2.7.1) that is resistant to volume expansion and catecholamines, and is accompanied by suspected or proven adrenal insufficiency.

The suppressive action of glucocorticoids on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most adults a single dose of 1 mg of dexamethasone at night is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosing Cushing's syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid can be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see also p. 26); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should **not** be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful

In acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylactic shock, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline (epinephrine) (section 3.4.3). In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

In the management of asthma, corticosteroids are preferably used by inhalation (section 3.2) but systemic therapy along with bronchodilators is required for the emergency treatment of severe acute asthma (section 3.1.1).

Dexamethasone should not be used routinely for the prophylaxis and treatment of chronic lung disease in neonates because of an association with adverse neurological effects.

Corticosteroids may be useful in conditions such as auto-immune hepatitis, rheumatoid arthritis, and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia (section 9.1.3) and thrombocytopenic purpura (section 9.1.4).

High doses of a corticosteroid (usually prednisolone) are used in the treatment of *glomerular kidney disease*, including *nephrotic syndrome*. The condition frequently recurs; a corticosteroid given in high doses and for prolonged periods may delay relapse but the higher incidence of adverse effects limits the overall benefit. Those who suffer frequent relapses may be treated with prednisolone given in a low dose (daily or on alternate days) for 3–6 months; the dose should be adjusted to minimise effects on growth and development. Other drugs used in the treatment of glomerular kidney disease include levamisole (section 5.5.2), cyclophosphamide and chlorambucil (section 8.1.1), and ciclosporin (section 8.2.2). *Congenital nephrotic syndrome* may be resistant to corticosteroids and immunosuppressants; indometacin (section 10.1.1) and an ACE inhibitor such as captopril (section 2.5.5.1) have been used.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see Prescribing in Palliative Care (p. 28), section 8.2.2 (immunosuppression), section 10.1.2 (rheumatic diseases), section 11.4 (eye), section 12.1.1 (otitis externa), section 12.2.1 (allergic rhinitis), and section 12.3.1 (aphthous ulcers).

Administration

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma (section 3.2). Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug (section 8.2.1).

Cautions and contra-indications of corticosteroids

Adrenal suppression

During prolonged therapy with corticosteroids, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death (see Withdrawal of Corticosteroids, below). Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules, and weight loss.

To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary re-introduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate post-operative period, anaesthetists **must** know whether a patient is taking or has been taking a corticosteroid. A regimen for corticosteroid replacement may be necessary before and after surgery.

Children on long-term corticosteroid treatment should carry a Steroid Treatment Card (see p. 449) which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

Infections

Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections, e.g. *septicaemia* and *tuberculosis*, may reach an advanced stage before being recognised, and *amoebiasis* or *strongyloidiasis* may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral *ocular infections* may also be exacerbated (see also section 11.4.1).

Chickenpox Unless they have had chickenpox, children receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being *at risk of severe chickenpox* (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature.

Passive immunisation with varicella–zoster immunoglobulin (section 14.5) is needed for exposed non-immune children receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment (section 5.3.2.1). Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

Measles Children taking corticosteroids, and their carers, should be advised to take particular care to avoid exposure to measles and to seek urgent medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin (section 14.5) may be needed.

Withdrawal of corticosteroids

The CSM has recommended that *gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression;
- received more than 40 mg daily prednisolone (or equivalent) [in adults];
- been given repeat doses in the evening;
- received more than 3 weeks' treatment.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 5 mg/m² daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

Psychiatric reactions

Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in children with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Children and their carers should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered cortico-

steroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

Advice to children and carers

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Children and carers should especially be advised of the following (for details, see Infections, Adrenal Suppression, and Psychiatric Reactions above and Withdrawal of Corticosteroids below):

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, children are at risk of severe **chickenpox** and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting **measles**;
- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the child or carer must mention the course of corticosteroid when receiving treatment for any illness or injury;
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the child can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;
- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur; for details see Side-effects of Corticosteroids, p. 448.

Steroid treatment cards (see p. 449) should be issued where appropriate. Doctors and pharmacists can obtain supplies of the card from:

Pregnancy and breast-feeding

The benefit of treatment with corticosteroids during pregnancy and breast-feeding outweighs the risk; pregnant women with fluid retention should be monitored closely.

Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM concluded:

- corticosteroids vary in their ability to cross the placenta; betamethasone and dexamethasone cross the placenta readily while 88% of prednisolone is inactivated as it crosses the placenta;
- there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip;

- when administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome);
- any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important;
- prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant; infants should be monitored for adrenal suppression if the mothers are taking a higher dose.

Other cautions and contra-indications

Other cautions include: growth restriction—possibly irreversible, frequent monitoring required if history of tuberculosis (or X-ray changes), hypertension, congestive heart failure, hepatic impairment (side-effects more common), renal impairment, diabetes mellitus including family history, osteoporosis, glaucoma (including family history), ocular herpes simplex—risk of corneal perforation, severe affective disorders (particularly if history of steroid-induced psychosis—see also Psychiatric Reactions above), epilepsy, peptic ulcer, hypothyroidism, history of steroid myopathy, ulcerative colitis, diverticulitis, recent intestinal anastomoses, thromboembolic disorders, myasthenia gravis; **interactions:** Appendix 1 (corticosteroids)

Other contra-indications include: systemic infection (unless specific therapy given); avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished)

Side-effects of corticosteroids

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Corticosteroids suppress growth and can affect the development of puberty. It is important to use the lowest effective dose; alternate-day regimens may be appropriate and limit growth reduction. For the effect of corticosteroids given in pregnancy, see Pregnancy and Breast-feeding, p. 447.

Mineralocorticoid side-effects include hypertension, sodium and water retention, and potassium, and calcium loss. They are most marked with fludrocortisone, but are significant with cortisone, hydrocortisone, corticotropin, and tetra-cosactide (tetracosactrin). Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

Glucocorticoid side-effects include diabetes and osteoporosis (section 6.6); in addition high doses are associated with avascular necrosis of the femoral head. Muscle wasting (proximal myopathy) can also occur. Corticosteroid therapy is also weakly linked with peptic ulceration (the potential advantage of soluble or enteric-coated preparations to reduce the risk is speculative only). See also Psychiatric Reactions, p. 446.

High doses of corticosteroids can cause Cushing's syndrome, with moon face, striae, and acne; it is usually reversible on withdrawal of treatment, but this must always be gradually tapered to avoid symptoms of acute adrenal insufficiency (**important:** see also Adrenal Suppression, p. 445).

Side-effects can be minimised by using the lowest effective dose for the minimum period possible.

Other side effects include: gastro-intestinal effects: dyspepsia, abdominal distension, acute pancreatitis, oesophageal ulceration and candidiasis; *musculoskeletal effects:* muscle weakness, vertebral and long bone fractures, tendon rupture; *endocrine effects:* menstrual irregularities and amenorrhoea, hirsutism, weight gain, negative nitrogen and calcium balance, increased appetite; increased susceptibility to and severity of infection, reactivation of dormant tuberculosis; *neuropsychiatric effects:* psychological dependence, insomnia, increased intracranial pressure with papil-

loedema (usually after withdrawal), aggravation of schizophrenia, aggravation of epilepsy; *ophthalmic effects*: glaucoma, papilloedema, posterior subcapsular cataracts, corneal or scleral thinning and exacerbation of ophthalmic viral or fungal disease, increased intra-ocular pressure, exophthalmos; *also* impaired healing, petechiae, ecchymoses, facial erythema, suppression of skin test reactions, urticaria, hyperhidrosis, skin atrophy, bruising, telangiectasia, myocardial rupture following recent myocardial infarction, congestive heart failure, leucocytosis, hyperglycaemia, hypersensitivity reactions (including anaphylaxis), thromboembolism, nausea, malaise, hiccups, headache, vertigo.

For other references to the side-effects of corticosteroids see section 1.5 (gastro-intestinal system), section 3.2 (asthma), section 11.4 (eye) and section 13.4 (skin).

STEROID TREATMENT CARD

**I am a patient on STEROID
treatment which must
not be stopped suddenly**

- If you have been taking this medicine for more than three weeks, the dose should be reduced gradually when you stop taking steroids unless your doctor says otherwise.
- Read the patient information leaflet given with the medicine.
- Always carry this card with you and show it to anyone who treats you (for example a doctor, nurse, pharmacist or dentist). For one year after you stop the treatment, you must mention that you have taken steroids.
- If you become ill, or if you come into contact with anyone who has an infectious disease, consult your doctor promptly. If you have never had chickenpox, you should avoid close contact with people who have chickenpox or shingles. If you do come into contact with chickenpox, see your doctor urgently.
- Make sure that the information on the card is kept up to date.

Label: 5, 10, steroid card**DEXAMETHASONE****Cautions** see notes above**Contra-indications** see notes above**Side-effects** see notes above; also perineal irritation may follow intravenous administration of the phosphate ester**Licensed use** not licensed for use in bacterial meningitis**Indication and dose**

Croup (see p. 169); nausea and vomiting with chemotherapy (section 8.1); rheumatic disease (section 10.1.2); eye (see p. 625); see also notes above

Note Dexamethasone 1 mg = dexamethasone phosphate 1.2 mg = dexamethasone sodium phosphate 1.3 mg**Inflammatory and allergic disorders**

- By mouth (as dexamethasone)

Child 1 month–18 years 10–100 micrograms/kg daily in 1–2 divided doses, adjusted according to response; up to 300 micrograms/kg daily may be required in emergency situations

- By intramuscular injection or slow intravenous injection or infusion (as dexamethasone phosphate)

Child 1 month–12 years 100–400 micrograms/kg daily in 1–2 divided doses; max. 24 mg daily**Child 12–18 years** initially 0.5–24 mg daily**Life-threatening cerebral oedema**

- By intravenous injection (as dexamethasone phosphate)

Child under 35 kg body-weight initially 20 mg, then 4 mg every 3 hours for 3 days, then 4 mg every 6 hours for 1 day, then 2 mg every 6 hours for 4 days, then decrease by 1 mg daily**Child over 35 kg body-weight** initially 25 mg, then 4 mg every 2 hours for 3 days, then 4 mg every 4 hours for 1 day, then 4 mg every 6 hours for 4 days, then decrease by 2 mg daily

□ DEXAMETHASONE (continued)

Bacterial meningitis (see section 5.1)

- By slow intravenous injection (as dexamethasone phosphate)

Child 2 months–18 years 150 micrograms/kg every 6 hours for 4 days starting before or with first dose of antibacterial

Physiological replacement

- By mouth or by slow intravenous injection (as dexamethasone)

Child 1 month–18 years 250–500 micrograms/m² every 12 hours, adjusted according to response

Administration for administration *by mouth* tablets may be dispersed in water or injection solution given by mouth

For *intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes

Dexamethasone (Non-proprietary) (PAM)

Tablets, dexamethasone 500 micrograms, net price 20 = 70p; 2 mg, 20 = £1.75. Label: 10, steroid card, 21

Available from Chemidex and Organon

Oral solution, sugar-free, dexamethasone (as dexamethasone sodium phosphate) 2 mg/5 mL, net price 150-mL = £42.30. Label: 10, steroid card, 21

Brands include *Dexso*[®]

Injection, dexamethasone phosphate (as dexamethasone sodium phosphate) 4 mg/mL, net price 1-mL amp = £1.00, 2-mL vial = £1.98; 24 mg/mL, 5-mL vial = £16.66. Label: 10, steroid card
Available from Hospira

Injection, dexamethasone (as dexamethasone sodium phosphate) 4 mg/mL, net price 1-mL amp = 91p, 2-mL vial = £1.27. Label: 10, steroid card
Available from Organon

HYDROCORTISONE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also phosphate ester associated with paraesthesia and pain (particularly in the perineal region)

Indication and dose

Adrenocortical insufficiency (section 6.3.1); shock (section 2.7.1), see also notes above; hypersensitivity reactions e.g. anaphylactic shock, angioedema (section 3.4.3); inflammatory bowel disease (section 1.5.2); haemorrhoids (section 1.7.2); rheumatic disease (section 10.1.2); eye (section 11.4.1); skin (section 13.4)

Congenital adrenal hyperplasia (see also section 6.3.1)

- By mouth

Neonate 6–7 mg/m² every 8 hours, adjusted according to response

Child 1 month–18 years 5–6.5 mg/m² every 8 hours, adjusted according to response; usual maintenance 4–5 mg/m² every 8 hours but higher doses may be needed

Acute adrenocortical insufficiency (Addisonian crisis) see also notes above and section 6.3.1

- By slow intravenous administration

Neonate initially 10 mg as a slow intravenous injection then 100 mg/m² daily as a continuous infusion or in divided doses every 6–8 hours; adjusted according to response; when stable reduce over 4–5 days to oral maintenance dose

Child 1 month–12 years initially 2–4 mg/kg as a slow intravenous injection or infusion then 2–4 mg/kg every 6 hours; adjusted according to response; when stable reduce over 4–5 days to oral maintenance dose

Child 12–18 years 100 mg every 6 to 8 hours by slow intravenous injection or infusion

Adrenal hypoplasia, Addison's disease, chronic maintenance or replacement therapy

- By mouth

Neonate usual dose 4–5 mg/m² every 8 hours; higher doses may be needed

Child 1 month–18 years usual dose 4–5 mg/m² every 8 hours; higher doses may be needed

Note larger doses given in the morning and smaller doses in the evening

Inflammatory bowel disease—induction of remission (see also section 1.5)

- By intravenous injection

Child 2–18 years 2.5 mg/kg (max. 100 mg) every 6 hours

- By continuous intravenous infusion

Child 2–18 years 10 mg/kg daily (max. 400 mg daily)

Severe acute asthma (see p. 168)

Acute hypersensitivity reactions, angioedema

- By intramuscular or intravenous injection

Child under 6 months initially 25 mg 3 times daily, adjusted according to response

Child 6 months–6 years initially 50 mg 3 times daily, adjusted according to response

Child 6–12 years initially 100 mg 3 times daily, adjusted according to response

Child 12–18 years initially 200 mg 3 times daily, adjusted according to response

⚠️ HYDROCORTISONE (continued)

Hypotension resistant to inotropic treatment and volume replacement (limited evidence)

- By intravenous injection

Neonate initially 2.5 mg/kg repeated if necessary after 4 hours, then 2.5 mg/kg every 6 hours for 48 hours or until blood pressure recovers, then dose reduced gradually over at least 48 hours

Child 1 month–18 years 1 mg/kg (max. 100 mg) every 6 hours

Administration for intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%; for intermittent infusion give over 20–30 minutes. For administration by mouth, injection solution may be swallowed [unlicensed use] but consider phosphate content; alternatively *Corlan*® pellets (section 12.3.1) may be swallowed [unlicensed use]—pellets should not be cut as may not provide appropriate dose

Hydrocortisone® (Non-proprietary) ^(PoM)

Tablets, scored, hydrocortisone 10 mg, net price 30-tab pack = £30.50; 20 mg, 30-tab pack = £32.00. Label: 10, steroid card, 21

¹Efcortisol® (Sovereign) ^(PoM)

Injection, hydrocortisone 100 mg (as sodium phosphate)/mL, net price 1-mL amp = 75p, 5-mL amp = £4.48. Label: 10, steroid card

Note Paraesthesia and pain (particularly in the perineal region) may follow intravenous injection of the phosphate ester

1. ^(PoM) restriction does not apply where administration is for saving life in emergency

¹Solu-Cortef® (Pharmacia) ^(PoM)

Injection, powder for reconstitution, hydrocortisone (as sodium succinate). Net price 100-mg vial = 92p, 100-mg vial with 2-mL amp water for injections = £1.16. Label: 10, steroid card

1. ^(PoM) restriction does not apply where administration is for saving life in emergency

▲ Extemporaneous formulations available see Extemporaneous Preparations, p. 8

METHYLPREDNISOLONE

Cautions see notes above; rapid intravenous administration of large doses associated with cardiovascular collapse

Contra-indications see notes above

Side-effects see notes above

Indication and dose

See also notes above; immunosuppression (section 8.2.2); rheumatic disease (section 10.1.2); skin (section 13.4)

Inflammatory and allergic disorders

- By mouth, slow intravenous injection or by intravenous infusion

Child 1 month–18 years 0.5–1.7 mg/kg daily in 2–4 divided doses depending on condition and response

Treatment of graft rejection reactions

- By intravenous injection

Child 1 month–18 years 10–20 mg/kg or 400–600 mg/m² (max. 1 g) once daily for 3 days

Severe erythema multiforme (Stevens-Johnson syndrome), lupus nephritis, systemic onset juvenile idiopathic arthritis (section 10.1.2.1)

- By intravenous injection

Child 1 month–18 years 10–30 mg/kg (max. 1 g) once daily or on alternate days for up to 3 doses

Administration intravenous injection given over 30 minutes; for intravenous infusion may be diluted with sodium chloride intravenous infusion 0.9% or 0.45%, or glucose intravenous infusion 5% or 10%

Medrone® (Pharmacia) ^(PoM)

Tablets, scored, methylprednisolone 2 mg (pink), net price 30-tab pack = £3.23; 4 mg, 30-tab pack = £6.19; 16 mg, 30-tab pack = £17.17; 100 mg (blue), 20-tab pack = £48.32. Label: 10, steroid card, 21

Solu-Medrone® (Pharmacia) ^(PoM)

Injection, powder for reconstitution, methylprednisolone (as sodium succinate) (all with solvent). Net price 40-mg vial = £1.58; 125-mg vial = £4.75; 500-mg vial = £9.60; 1-g vial = £17.30; 2-g vial = £32.86. Label: 10, steroid card

▲ Intramuscular depot

Depo-Medrone® (Pharmacia) ^(PoM)

Injection (aqueous suspension), methylprednisolone acetate 40 mg/mL. Net price 1-mL vial = £2.87; 2-mL vial = £5.15; 3-mL vial = £7.47. Label: 10, steroid card

Dose

- By deep intramuscular injection into gluteal muscle seek specialist advice

PREDNISOLONE

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Indication and dose

See also notes above

Asthma see p. 184

□ PREDNISOLONE (continued)

Autoimmune inflammatory disorders (including juvenile idiopathic arthritis, connective tissue disorders and systemic lupus erythematosus)

- **By mouth**

Child 1 month–18 years initially 1–2 mg/kg once daily (usual max. 60 mg daily), then reduced after a few days if appropriate

Autoimmune hepatitis

- **By mouth**

Child 1 month–18 years initially 2 mg/kg once daily (max. 40 mg daily) then reduced to minimum effective dose

Corticosteroid replacement therapy

- **By mouth**

Child 12–18 years 5 mg/m² daily in 1–2 divided doses adjusted according to response

Ear section 12.1.1

Infantile spasms

- **By mouth**

Child 1 month–2 years initially 10 mg 4 times daily for 14 days (if seizures not controlled after 7 days increase to 20 mg 3 times daily for 7 days); reduce dose gradually over 15 days until stopped (patients taking 40 mg daily, reduce dose in steps of 10 mg every 5 days, then stop; patients taking 60 mg daily, reduce dose to 40 mg daily for 5 days, then 20 mg daily for 5 days, then 10 mg daily for 5 days, then stop)

Eye section 11.4.1

Idiopathic thrombocytopenic purpura

- **By mouth**

Child 1–10 years 1–2 mg/kg daily for max. 14 days or 4 mg/kg daily for max. 4 days

Immunosuppression see p. 520

Inflammatory bowel disease see p. 73

Nephrotic syndrome

- **By mouth**

Child 1 month–18 years initially 60 mg/m² once daily (max. 80 mg daily) for 4–6 weeks until proteinuria ceases then 40 mg/m² on alternate days for 4–6 weeks, then withdraw by reducing dose gradually; prevention of relapse 0.5–1 mg/kg once daily or on alternate days for 3–6 months

Pneumocystis pneumonia see p. 411

Rheumatic disease see p. 607

Prednisolone (Non-proprietary) (PmI)

Tablets, prednisolone 1 mg, net price 28-tab pack = 88p; 5 mg, 28-tab pack = 98p; 25 mg, 56-tab pack = £20.00. Label: 10, steroid card, 21

Tablets, both e/c, prednisolone 2.5 mg (brown), net price 30-tab pack = £4.81; 5 mg (red), 30-tab pack = £4.88. Label: 5, 10, steroid card, 25
Brands include *Deltacortril Enteric*®

Soluble tablets, prednisolone 5 mg (as sodium phosphate), net price 30-tab pack = £7.45. Label: 10, steroid card, 13, 21

6.4 Sex hormones

- 6.4.1 Female sex hormones
- 6.4.2 Male sex hormones and antagonists
- 6.4.3 Anabolic steroids

Sex hormone replacement therapy is indicated in children for the treatment of gonadotrophin deficiency, gonadal disorders, or delayed puberty that interferes with quality of life. Indications include constitutional delay in puberty, congenital or acquired hypogonadotropic hypogonadism, hypergonadotrophic hypogonadism (Turner's syndrome, Klinefelter's syndrome), endocrine disorders (Cushing's syndrome or hyperprolactinaemia), and chronic illnesses, such as cystic fibrosis or sickle-cell disease, that may affect the onset of puberty.

Replacement therapy is generally started at the appropriate age for the development of puberty and should be managed by a paediatric endocrinologist. Patients with constitutional delay, chronic illness, or eating disorders may need only small doses of hormone supplements for 4 to 6 months to induce puberty and endogenous sex hormone production, which is then sustained. Patients with organic causes of hormone deficiency will require life-long replacement, adjusted to allow normal development.

Inadequate treatment may lead to poor bone mineralisation, resulting in fractures and osteoporosis.

6.4.1 Female sex hormones

6.4.1.1 Oestrogens

6.4.1.2 Progestogens

6.4.1.1 Oestrogens

Oestrogens are necessary for the development of female secondary sexual characteristics. If onset of puberty is delayed because of organic pathology, puberty can be induced with ethinylestradiol in increasing doses, guided by breast staging and uterine scans. Cyclical progestogen replacement is added after 12–18 months of oestrogen treatment (see section 6.4.1.2). Once the adult dosage of oestrogen has been reached (20 micrograms ethinylestradiol daily), it may be more convenient to provide replacement either as a low-dose oestrogen containing oral contraceptive formulation [unlicensed indication] (see section 7.3.1) or as a combined oestrogen and progestogen hormone replacement therapy preparation [unlicensed indication] (see BNF section 6.4.1.2). There is limited experience in the use of transdermal patches or gels in children; compliance and skin irritation are sometimes a problem.

Ethinylestradiol is occasionally used, under **specialist supervision**, for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited), for the prevention of tall stature, and in tests of growth hormone secretion (see below). Side-effects include nausea and fluid retention.

Topical oestrogen creams are used in the treatment of labial adhesions (see section 7.2.1)

ETHINYLESTRADIOL

(Ethinylestradiol)

Cautions see Combined Hormonal Contraceptives (section 7.3.1); **interactions:** Appendix 1 (Oestrogens)

Contra-indications cardiovascular disease (sodium retention with oedema), personal or family history of thromboembolism, acute porphyria; see also Combined Hormonal Contraceptives (section 7.3.1)

Hepatic impairment contra-indicated in liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and jaundice

Pregnancy contra-indicated

Breast-feeding contra-indicated

Side-effects nausea, vomiting, headache, breast tenderness, changes in body weight, fluid retention, depression, chorea, skin reactions, chloasma, hypertension, may irritate contact lenses, impairment of liver function, hepatic tumours, rarely photosensitivity; see also Combined Hormonal Contraceptives (section 7.3.1)

Licensed use unlicensed for use in children

Indication and dose

See notes above

Induction of sexual maturation in girls• **By mouth**

Initially 2 micrograms daily, increasing every 6 months to 5 micrograms, then to 10 micrograms, and then to 20 micrograms daily

Note after 12–18 months of treatment give progestogen for 7 days of each 28-day cycle

Maintenance of sexual maturation in girls• **By mouth**

20 micrograms daily with cyclical progestogen for 7 days of each 28-day cycle

Prevention of tall stature in girls• **By mouth**

Girls 2–12 years 20–50 micrograms daily

Pituitary priming before growth hormone secretion test in girls• **By mouth**

Girls with bone age above 10 years 100 micrograms daily for 3 days before test

Ethinylestradiol (Non-proprietary) ^(POM)

Tablets, ethinylestradiol (unlicensed) 10 micrograms, net price 21-tab pack = £15.55; 50 micrograms, 21-tab pack = £18.55; 1 mg, 28-tab pack = £34.53

Note 2 microgram tablets available from 'special-order' manufacturers or specialist-importing companies, see p. 943

6.4.1.2 Progestogens

There are two main groups of progestogen, *progesterone and its analogues* (dydrogesterone and medroxyprogesterone) and *testosterone analogues* (norethisterone and norgestrel). The newer progestogens (desogestrel, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel is the active isomer of

norgestrel and has twice its potency. Progesterone and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

In delayed puberty cyclical progestogen is added after 12–18 months of oestrogen therapy (section 6.4.1.1) to establish a menstrual cycle; usually levonorgestrel 30 micrograms or norethisterone 5 mg daily are used for the last 7 days of each 28 day cycle.

Norethisterone is also used to postpone menstruation during a cycle; treatment is started 3 days before the expected onset of menstruation.

NORETHISTERONE

Cautions conditions that may worsen with fluid retention e.g. epilepsy, hypertension, migraine, asthma, cardiac or renal dysfunction; susceptibility to thromboembolism (particular caution with high dose); history of depression; diabetes (monitor closely); **interactions:** Appendix 1 (progestogens)

Hepatic impairment caution; avoid if severe

Breast-feeding higher doses may suppress lactation and alter milk composition; use lowest effective dose

Contra-indications history of liver tumours, severe liver impairment; severe arterial disease, undiagnosed vaginal bleeding; acute porphyria (section 9.8.2); history during pregnancy of idiopathic jaundice, severe pruritus, or pemphigoid gestationis

Pregnancy contra-indicated

Side-effects menstrual disturbances, premenstrual-like syndrome (including bloating, fluid retention, breast tenderness), weight gain, nausea, headache, dizziness, insomnia, drowsiness, depression; skin reactions (including urticaria, pruritus, rash, and acne), hirsutism and alopecia; jaundice and anaphylactoid reactions also reported

Licensed use not licensed for use in children

Indication and dose

See notes above

Induction and maintenance of sexual maturation in females (combined with an oestrogen after 12–24 months oestrogen therapy)

- **By mouth**

5 mg once daily for the last 7 days of a 28-day cycle

Postponement of menstruation

- **By mouth**

5 mg 3 times daily, starting 3 days before expected onset of menstruation

Norethisterone (Non-proprietary) (POM)

Tablets, norethisterone 5 mg, net price 30-tab pack = £2.65

Primolut N® (Schering Health) (POM)

Tablets, norethisterone 5 mg. Net price 30-tab pack = £2.01

Utovlan® (Pharmacia) (POM)

Tablets, norethisterone 5 mg, net price 30-tab pack = £1.40, 90-tab pack = £4.21

6.4.2 Male sex hormones and antagonists

Androgens cause masculinisation; they are used as replacement therapy in androgen deficiency, in delayed puberty, and in those who are hypogonadal due to either pituitary or testicular disease.

When given to patients with hypopituitarism androgens can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone (section 6.5.1) which stimulates spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate or propionate or alternatively *Sustanon*®, which consists of a mixture of testosterone esters and has a longer duration of action, can be used. For induction of puberty, depot testosterone injections are given monthly and the doses increased every 6 to 12 months according to response. Single ester testosterone injections may need to be given more frequently. Testosterone enantate is unlicensed in children. Implants of testosterone can be used for hypogonadism; the implants are replaced every 4 to 5 months.

Oral **testosterone undecanoate** is used for induction of puberty. An alternative approach that promotes growth rather than sexual maturation uses oral oxandrolone (section 6.4.3).

Chorionic gonadotrophin (section 6.5.1) has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

Caution should be used when androgens or chorionic gonadotrophin are used in treating boys with delayed puberty since the fusion of epiphyses is hastened and may result in short stature.

Testosterone patches and topical gel are also available but experience of their use in children under 15 years is limited. Topical testosterone is applied to the penis in the treatment of micropallus; an extemporaneously prepared cream should be used because the alcohol in proprietary gel formulations causes irritation.

TESTOSTERONE AND ESTERS

Cautions cardiac impairment, hypertension, epilepsy, migraine, diabetes mellitus, skeletal metastases (risk of hypercalcaemia); **interactions:** Appendix 1 (testosterone)

Hepatic impairment avoid if possible—fluid retention and dose-related toxicity

Renal impairment caution—potential for fluid retention

Contra-indications history of primary liver tumours, hypercalcaemia, nephrosis

Pregnancy avoid; causes masculinisation of female fetus

Breast-feeding avoid; may cause masculinisation in the female infant or precocious development in the male infant; high doses suppress lactation

Side-effects headache, depression, gastro-intestinal bleeding, nausea, cholestatic jaundice, changes in libido, gynaecomastia, polycythaemia, anxiety, asthenia, paraesthesia, hypertension, electrolyte disturbances including sodium retention with oedema and hypercalcaemia, weight gain; increased bone growth; androgenic effects such as hirsutism, male-pattern baldness, seborrhoea, acne, pruritus; excessive frequency and duration of penile erection, precocious sexual development and premature closure of epiphyses in pre-pubertal males, suppression of spermatogenesis in males and virilism in females; rarely liver tumours; sleep apnoea also reported; with patches and gel, local irritation and allergic reactions

Licensed use *Sustanon*[®] and *Virormone*[®] licensed for use in children; *Andropatch*[®] licensed for use in children over 15 years

Indication and dose

See also under preparations; specialist use only

Induction and maintenance of sexual maturation in males

- By mouth (as testosterone undecanoate)

Child over 12 years 40 mg on alternate days increasing according to response up to 120 mg daily

- By deep intramuscular injection of testosterone enantate or propionate

Child over 12 years 25–50 mg/m² every month increasing dose every 6–12 months according to response

- Patch

Child over 15 years apply to clean, dry, unbroken skin on back, abdomen, upper arms or thighs, removing after 24 hours and sitting replacement patch on a different area (with an interval of 7 days before using the same site);

initially apply patches equivalent to testosterone 5 mg/24 hours (2.5 mg/24 hours in non-virilised patients) at night (approx. 10 p.m.), then adjust to 2.5–7.5 mg every 24 hours according to plasma-testosterone concentration

Treatment of micropallus

- Topically

Apply 3 times daily for 3 weeks

Note Use only specially manufactured preparation (see notes above)

Oral

Restandol[®] Testocaps (Organon) ^(PoM)

Capsules, orange, testosterone undecanoate 40 mg in oily solution. Net price 30-cap pack = £8.89; 60-cap pack = £17.79. Label: 21, 25

Intramuscular

Testosterone Enantate (Cambridge) ^(PoM)

Injection (oily), testosterone enantate 250 mg/mL. Net price 1-mL amp = £11.01

Sustanon 100[®] (Organon) ^(PoM)

Injection (oily), testosterone propionate 20 mg, testosterone phenylpropionate 40 mg, and testosterone isocaproate 40 mg/mL. Net price 1-mL amp = £1.09

Excipients include arachis (peanut) oil, benzyl alcohol (see Excipients p. 3)

Dose

Delayed puberty in males

- By intramuscular injection

1 mL every month for 3 doses

Pituitary priming prior to growth hormone secretion test

- By deep intramuscular injection

1 mL 3–5 days before test

Sustanon 250[®] (Organon) ^(PoM)

Injection (oily), testosterone propionate 30 mg, testosterone phenylpropionate 60 mg, testosterone isocaproate 60 mg, and testosterone decanoate 100 mg/mL. Net price 1-mL amp = £2.55

Excipients include arachis (peanut) oil, benzyl alcohol (see Excipients p. 3)

Virormone[®] (Nordic) ^(PoM)

Injection, testosterone propionate 50 mg/mL. Net price 2-mL amp = 45p

▢ TESTOSTERONE AND ESTERS (continued)

■ Implant

Testosterone (Organon) (POM)

Implant, testosterone 100 mg, net price = £7.40; 200 mg = £13.79

Dose

Maintenance of sexual maturation in males

Child over 16 years 100–600 mg; 600 mg usually maintains plasma-testosterone concentration within the normal range for 4–5 months

■ Cream

Testosterone

Cream, testosterone 5% (other strengths available) Available from 'special-order' manufacturers or specialist importing companies, see p.943

■ Transdermal preparations

Andropatch® (GSK) (POM)

Patches, self-adhesive, releasing testosterone approx. 2.5 mg/24 hours, net price 60-patch pack = £49.10; releasing testosterone approx. 5 mg/24 hours, net price 30-patch pack = £49.10. Counselling, administration

Anti-androgens and precocious puberty

The gonadorelin stimulation test (section 6.5.1) is used to distinguish between *gonadotrophin-dependent (central) precocious puberty* and *gonadotrophin-independent precocious puberty*. Treatment requires specialist management.

Gonadorelin analogues, used in the management of gonadotrophin-dependent precocious puberty, delay development of secondary sexual characteristics and growth velocity.

Testolactone and cyproterone are used in the management of gonadotrophin-independent precocious puberty, resulting from McCune-Albright syndrome, familial male precocious puberty (testotoxicosis), hormone-secreting tumours, and ovarian and testicular disorders. Testolactone inhibits the aromatisation of testosterone, the rate limiting step in oestrogen synthesis. Cyproterone is a progestogen with anti-androgen properties.

Spirolactone (section 2.2.3) is sometimes used in combination with testolactone because it has some androgen receptor blocking properties.

High blood concentration of sex hormones may activate release of gonadotrophin releasing hormone, leading to development of secondary, central gonadotrophin-dependent precocious puberty. This may require the addition of gonadorelin analogues to prevent progression of pubertal development and skeletal maturation.

CYPROTERONE ACETATE

Cautions blood counts initially and throughout treatment; monitor adrenocortical function regularly; diabetes mellitus (see also Contra-indications)

Skilled tasks Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)

Hepatic impairment monitor hepatic function regularly—dose-related toxicity, see side-effects below

Contra-indications hepatic disease, severe diabetes (with vascular changes); sickle-cell anaemia, malignant or wasting disease, severe depression, history of thrombo-embolic disorders

Side-effects fatigue and lassitude, breathlessness, weight changes, reduced sebum production (may clear acne), changes in hair pattern, gynaecomastia (rarely leading to galactorrhoea and benign breast nodules); rarely hypersensitivity reactions, rash and osteoporosis; inhibition of spermatogenesis (see notes above); hepatotoxicity reported (including jaundice, hepatitis and hepatic failure)

Hepatotoxicity Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (usually after several months) with cyproterone acetate 200–300 mg daily. Liver function tests should be performed

before treatment and whenever symptoms suggestive of hepatotoxicity occur—if confirmed cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk)

Licensed use unlicensed for use in children

Indication and dose

Gonadotrophin-independent precocious puberty (specialist use only; see also notes above)

• By mouth

Initially 25 mg twice daily, adjusted according to response

Cyproterone Acetate (Non-proprietary) (POM)

Tablets, cyproterone acetate 50 mg, net price 56-tab pack = £31.54. Label: 21, counselling, driving
Note 10 mg tablets available from 'special-order' manufacturers or specialist-importing companies, see p.943

Androcur® (Schering Health) (POM)

Tablets, scored, cyproterone acetate 50 mg. Net price 56-tab pack = £25.89. Label: 21, counselling, driving

TESTOLACTONE

Cautions interactions: Appendix 1 (testolactone)

Contra-indications

Pregnancy avoid

Breast-feeding no information available

Side-effects nausea, vomiting, anorexia, diarrhoea; hypertension; peripheral neuropathy; weight changes; changes in hair pattern; rarely hypersensitivity reactions, rash

Indication and dose

Gonadotrophin-independent precocious puberty (specialist use only; see also notes above)

• **By mouth**

5 mg/kg 3–4 times daily; up to 10 mg/kg 4 times daily may be required

Testolactone (PoM)

Tablets, testolactone 50 mg

Available from 'special-order' manufacturers or specialist importing companies, see p. 943

GOSERELIN

Cautions monitor bone mineral density

Contra-indications undiagnosed vaginal bleeding

Pregnancy manufacturer advises avoid

Breast-feeding manufacturer advises avoid

Side-effects changes in blood pressure, headache, mood changes including depression, hypersensitivity reactions including urticaria, pruritus, rash, asthma and anaphylaxis; changes in scalp and body hair, weight changes, withdrawal bleeding, ovarian cysts (may require withdrawal), breast swelling and tenderness (males and females), visual disturbances, paraesthesia, local reactions at injection site

Licensed use not licensed for use in children

Indication and dose

Gonadotrophin-dependent precocious puberty

see notes above; for doses, see under preparations below

Note Injections may be required more frequently in some cases

Administration Rotate injection site to prevent atrophy and nodule formation

Zoladex[®] (AstraZeneca) (PoM)

Implant, goserelin 3.6 mg (as acetate) in *Safe-System*[®] syringe applicator. Net price each = £84.14

Dose

- **Implant**, by subcutaneous injection into anterior abdominal wall
3.6 mg every 4 weeks

Zoladex[®] LA (AstraZeneca) (PoM)

Implant, goserelin 10.8 mg (as acetate) in *Safe-System*[®] syringe applicator. Net price each = £267.48

Dose

- **Implant**, by subcutaneous injection into anterior abdominal wall
10.8 mg every 12 weeks

LEUPRORELIN ACETATE

Cautions see Goserelin

Contra-indications see Goserelin

Pregnancy avoid—teratogenic in *animal* studies

Breast-feeding manufacturer advises avoid

Side-effects see Goserelin

Licensed use not licensed for use in children

Indication and dose

Gonadotrophin-dependent precocious puberty

see notes above; for doses, see under preparations below

Note Injections may be required more frequently in some cases

Prostap[®] SR (Wyeth) (PoM)

Injection (microsphere powder for reconstitution), leuprorelin acetate, net price 3.75-mg vial with 1-mL vehicle-filled syringe = £125.40

Dose

- **By subcutaneous or by intramuscular injection**
3.75 mg every four weeks (half this dose is sometimes used in children with body-weight under 20 kg)

Prostap[®] 3 (Wyeth) (PoM)

Injection (microsphere powder for reconstitution), leuprorelin acetate, net price 11.25-mg vial with 2-mL vehicle-filled syringe = £376.20

Dose

- **By subcutaneous or by intramuscular injection**
11.25 mg every 12 weeks

TRIPTORELIN

Cautions see Goserelin

Contra-indications see Goserelin

Pregnancy manufacturer advises avoid

Breast-feeding manufacturer advises avoid

Side-effects see Goserelin; also gastro-intestinal disturbances; asthenia; arthralgia

□ TRIPTORELIN (*continued*)

Indication and dose

Gonadotrophin-dependent precocious puberty

see notes above; for doses see under preparations below

Administration rotate injection site to prevent atrophy and nodule formation

Decapeptyl® SR (Ipsen) ^(POM)

Injection, (powder for suspension), m/r, triptorelin (as acetate), net price 11.25-mg vial (with diluent) = £207.00

Dose

- **By intramuscular injection**

11.25 mg every 3 months

Note Each vial includes an overage to allow accurate administration of 11.25 mg dose

Gonapeptyl® Depot (Ferring) ^(POM)

Injection (powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £85.00

Dose

- **By subcutaneous or by intramuscular injection**

Body-weight under 20 kg initially 1.875 mg on days 0, 14, and 28, then 1.875 mg every 4 weeks

Body-weight 20–30 kg initially 2.5 mg on days 0, 14, and 28, then 2.5 mg every 4 weeks

Body-weight over 30 kg initially 3.75 mg on days 0, 14, and 28, then 3.75 mg every 4 weeks; discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys

Note may be given every 3 weeks if necessary

6.4.3 Anabolic steroids

Anabolic steroids have some androgenic activity but in girls they cause less virilisation than androgens. They are used in the treatment of some *aplastic anaemias* (section 9.1.3). Oxandrolone is used to stimulate late pre-pubertal growth prior to induction of sexual maturation in boys with short stature and in girls with Turner's syndrome; specialist management is required.

OXANDROLONE

Cautions see Testosterone (section 6.4.2); **interactions:** Appendix 1 (oxandrolone)

Contra-indications see Testosterone (section 6.4.2)

Side-effects see Testosterone (section 6.4.2)

Indication and dose

Stimulation of late pre-pubertal growth in boys with short stature

- **By mouth**

Boys 10–18 years (or appropriate age) 1.25–2.5 mg daily for 3–6 months

Stimulation of late pre-pubertal growth in girls with Turner's syndrome

- **By mouth**

Girls in combination with growth hormone 0.625–2.5 mg daily

Oxandrolone

Tablets, oxandrolone 2.5 mg

Available from 'special-order' manufacturers or specialist importing companies, see p.943

6.5 Hypothalamic and pituitary hormones

6.5.1 Hypothalamic and anterior pituitary hormones including growth hormone

6.5.2 Posterior pituitary hormones and antagonists

Use of preparations in these sections requires detailed prior investigation of the patient and *should be reserved for specialist centres*.

6.5.1 Hypothalamic and anterior pituitary hormones including growth hormone

Anterior pituitary hormones

Corticotrophins

Tetracosactide (tetracosactrin), an analogue of corticotropin (adrenocorticotrophic hormone, ACTH), is used to test adrenocortical function; failure of plasma-cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency. A low-dose test is considered by some clin-

icians to be more sensitive when used to confirm established, partial adrenal suppression.

Tetracosactide should be used with caution in patients with allergic disorders e.g. asthma and should be given only if no other ACTH preparations have been given previously. Tetracosactide depot injection (*Synacthen Depot*[®]) is also used in the treatment of infantile spasms (see Infantile spasms, section 4.8.1) but it is contraindicated in neonates because of the presence of benzyl alcohol in the injection. Corticotropin-releasing factor, corticorelin, (also known as corticotropin-releasing hormone, CRH) is used to test anterior pituitary function and secretion of corticotropin.

TETRACOSACTIDE

(Tetracosactrin)

Cautions as for corticosteroids, section 6.3.2; **important:** risk of anaphylaxis (medical supervision; consult product literature); **interactions:** Appendix 1 (corticosteroids)

Contra-indications as for corticosteroids, section 6.3.2; avoid injections containing benzyl alcohol in neonates (see under preparations)

Pregnancy avoid

Breast-feeding avoid

Side-effects as for corticosteroids, section 6.3.2

Licensed use not licensed for low-dose test for adrenocortical insufficiency or treatment of infantile spasms

Indication and dose

See notes above and under preparations below

Synacthen[®] (Alliance) (PmI)

Injection, tetracosactide 250 micrograms (as acetate)/mL. Net price 1-mL amp = £2.93

Dose

Diagnosis of adrenocortical insufficiency (30-minute test)

- **By intramuscular or intravenous injection**

Standard-dose test 145 micrograms/m² (max. 250 micrograms) as a single dose

Low-dose test 300 nanograms/m² as a single dose

Administration may be diluted in sodium chloride 0.9% to 250 nanograms/mL

Synacthen Depot[®] (Alliance) (PmI)

Injection (aqueous suspension), tetracosactide acetate 1 mg/mL, with zinc phosphate complex. Net price 1-mL amp = £4.18

Excipients include benzyl alcohol (avoid in neonates, see Excipients p. 3)

Dose

Infantile spasms

- **By intramuscular injection**

Child 1 month–2 years initially 500 micrograms on alternate days, adjusted according to response

CORTICORELIN

(Corticotropin-releasing hormone, CRH)

Contra-indications

Pregnancy contra-indicated

Breast-feeding contra-indicated

Side-effects flushing of face, neck and upper body, hypotension, mild sensation of taste or smell

Licensed use not licensed

Indication and dose

Test of anterior pituitary function

- **By intravenous injection over 30 seconds**

Child 1 month–18 years 1 microgram/kg (max. 100 micrograms) as a single dose

CRH Ferring[®] (Shire) (PmI)

Injection, corticorelin 100 micrograms

Gonadotrophins

Gonadotrophins are occasionally used in the treatment of hypogonadotropic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin is used in the investigation of testicular function in suspected primary hypogonadism and incomplete masculinisation. It has also been used in delayed puberty in boys to stimulate endogenous testosterone production, but it has little advantage over testosterone (section 6.4.2).

CHORIONIC GONADOTROPHIN

(Human Chorionic Gonadotrophin; HCG)

A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone

Cautions cardiac or renal impairment, asthma, epilepsy, migraine; prepubertal boys (risk of pre-

◊ CHORIONIC GONADOTROPHIN (*continued*)

mature epiphyseal closure or precocious puberty)

Contra-indications androgen-dependent tumours

Side-effects oedema (reduce dose), headache, tiredness, mood changes, gynaecomastia, local reactions

Licensed use unlicensed in children for test of testicular function

Indication and dose

Test of testicular function

- By intramuscular injection
Short stimulation test:

Child 1 month–18 years 1500–2000 units once daily for 3 days

Prolonged stimulation test:

Child 1 month–18 years 1500–2000 units twice weekly for 3 weeks

Hypogonadotrophic hypogonadism

- By intramuscular injection

Child 1 month–18 years 1000–2000 units twice weekly, adjusted to response

Undescended testes

- By intramuscular injection

Child 7–18 years initially 500 units 3 times weekly (1000 units twice weekly if over 17 years); adjusted to response; up to 4000 units 3 times weekly may be required; continue for 1–2 months after testicular descent

Choragon® (Ferring) (PoM)

Injection, powder for reconstitution, chorionic gonadotrophin. Net price 5000-unit amp (with solvent) = £3.26. For intramuscular injection

Pregnyl® (Organon) (PoM)

Injection, powder for reconstitution, chorionic gonadotrophin. Net price 1500-unit amp = £2.20; 5000-unit amp = £3.27 (both with solvent). For subcutaneous or intramuscular injection

Growth hormone

Growth hormone is used to treat proven deficiency of the hormone, Prader-Willi syndrome, Turner's syndrome, growth disturbance in children born small for gestational age, and chronic renal insufficiency (see NICE guidance below). Growth hormone is also used in Noonan syndrome and idiopathic short stature [unlicensed indications] under specialist management. Treatment should be initiated and monitored by a paediatrician with expertise in managing growth-hormone disorders; treatment can be continued under a shared-care protocol by a general practitioner.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, **somatropin**, produced using recombinant DNA technology.

NICE guidance

Somatropin in children with growth failure (May 2002)

Treatment with somatropin is recommended for children with:

- proven growth-hormone deficiency;
- Turner's syndrome;
- Prader-Willi syndrome;
- chronic renal insufficiency before puberty.

Treatment should be discontinued if the response is poor (i.e. an increase in growth velocity of less than 50% from baseline) in the first year of therapy.

In children with chronic renal insufficiency, treatment should be stopped after renal transplantation and not restarted for at least a year

Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children with severe primary insulin-like growth factor-I deficiency (section 6.7.4).

SOMATROPIN

(Synthetic Human Growth Hormone)

Cautions diabetes mellitus (adjustment of anti-diabetic therapy may be necessary), papilloedema (see under Side-effects), relative deficiencies of other pituitary hormones (notably hypo-

thyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value), history of malignant disease, disorders of the epiphysis of the hip (monitor for limping), resolved intracranial hypertension

◊ SOMATROPIN (continued)

(monitor closely), initiation of treatment close to puberty not recommended in child born small for gestational age; Silver-Russell syndrome; rotate subcutaneous injection sites to prevent lipatrophy; **interactions:** Appendix 1 (somatropin)

Breast-feeding no information available but absorption from milk unlikely

Contra-indications evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting); not to be used after renal transplantation or for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome); severe obesity or severe respiratory syndrome in Prader-Willi syndrome

Pregnancy interrupt treatment if pregnancy occurs

Side-effects headache, funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); fluid retention (peripheral oedema), arthralgia, myalgia, carpal tunnel syndrome, paraesthesia, antibody formation, hypothyroidism, insulin resistance, hyperglycaemia, hypoglycaemia, reactions at injection site; leukaemia in children with growth hormone deficiency also reported

Licensed use *Genotropin*[®] and *Omnitrope*[®] not licensed for use in Noonan syndrome; *Humatrope*[®], *Nutropin Aq*[®], and *Saizen*[®] not licensed for use in Prader-Willi syndrome, Noonan syndrome, or growth disturbance in children born small for gestational age; *Norditropin*[®] not licensed for use in Prader-Willi syndrome or Noonan syndrome; *Zomacton*[®] not licensed for use in chronic renal insufficiency, Prader-Willi syndrome, Noonan syndrome or growth disturbance in children born small for gestational age

Indication and dose

Gonadal dysgenesis (Turner's syndrome)

- By subcutaneous injection
45–50 micrograms/kg daily or 1.4 mg/m² daily

Deficiency of growth hormone

- By subcutaneous or intramuscular injection
23–39 micrograms/kg daily or 0.7–1 mg/m² daily

Prader-Willi syndrome

- By subcutaneous injection
Children with growth velocity greater than 1 cm/year in combination with energy-restricted diet, 35 micrograms/kg daily or 1 mg/m² daily; max. 2.7 mg daily

Chronic renal insufficiency (renal function decreased to less than 50%)

- By subcutaneous injection
45–50 micrograms/kg daily or 1.4 mg/m² daily (higher doses may be needed) adjusted if necessary after 6 months

Growth disturbance in children born small for gestational age whose growth has not caught up by 4 years of age or later; Noonan syndrome

- By subcutaneous injection
35 micrograms/kg daily or 1 mg/m² daily

Genotropin[®] (Pharmacia) (POM)

Injection, two-compartment cartridge containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) cartridge = £122.87, 12-mg (36-unit) cartridge = £278.20. For use with *Genotropin*[®] Pen (JMS) device (available free of charge from clinics). For subcutaneous injection

MiniQuick injection, two-compartment single-dose syringe containing powder for reconstitution, somatropin (rbe) and diluent, net price 0.2-mg (0.6-unit) syringe = £4.64; 0.4-mg (1.2-unit) syringe = £9.27; 0.6-mg (1.8-unit) syringe = £13.91; 0.8-mg (2.4-unit) syringe = £18.55; 1-mg (3-unit) syringe = £23.18; 1.2-mg (3.6-unit) syringe = £27.82; 1.4-mg (4.2-unit) syringe = £32.46; 1.6-mg (4.8-unit) syringe = £37.09; 1.8-mg (5.4-unit) syringe = £41.73; 2-mg (6-unit) syringe = £46.37. For subcutaneous injection

Humatrope[®] (Lilly) (POM)

Injection, powder for reconstitution, somatropin (rbe), net price 6-mg (18-unit) cartridge = £137.25; 12-mg (36-unit) cartridge = £274.50; 24-mg (72-unit) cartridge = £549.00; all supplied with diluent. For subcutaneous or intramuscular injection; cartridges for subcutaneous injection

Norditropin[®] (Novo Nordisk) (POM)

SimpleXx injection, somatropin (epi) 3.3 mg (10 units)/mL, net price 1.5-mL (5-mg, 15-unit) cartridge = £115.90; 6.7 mg (20 units)/mL, 1.5-mL (10-mg, 30-unit) cartridge = £231.80; 10 mg (30 units)/mL, 1.5-mL (15-mg, 45-unit) cartridge = £347.70. For use with appropriate *NordiPen*[®] (JMS) device (available free of charge from clinics). For subcutaneous injection

NutropinAq (Ipsen) (POM)

Injection, Somatropin (rbe), net price 10 mg (30 units) 2-mL cartridge = £230.00. For use with *NutropinAq*[®] Pen (JMS) device (available free of charge from clinics). For subcutaneous injection

Omnitrope[®] (Sandoz) (POM)

Injection, somatropin (rbe) 3.3 mg (10 units)/mL, net price 1.5 mL (5-mg, 15-unit) cartridge = £91.33; 6.7 mg (20 units)/mL, 1.5 mL (10-mg, 30-unit) cartridge = £182.66. For use with *Omnitrope Pen 5*[®] (JMS) and *Omnitrope Pen 10*[®] (JMS) devices respectively (available free of charge from clinics). For subcutaneous injection

Note Biosimilar medicine, see p. 2

Saizen[®] (Serono) (POM)

Injection, powder for reconstitution, somatropin (rmc), net price 1.33-mg (4-unit) vial (with diluent) = £29.28; 3.33-mg (10-unit) vial (with diluent) = £73.20. For subcutaneous or intramuscular injection

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 3)

☞ SOMATROPIN (continued)

Click.easy[®], powder for reconstitution, somatropin (rmc), net price 8-mg (24-unit) vial (in **Click.easy**[®] device with diluent) = £185.44. For use with **One.click**[®] **JMS** autoinjector device or **Cool.Click**[®] **JMS** needle-free device (both available free of charge from clinics). For subcutaneous injection

Zomacton[®] (Ferring) **PoM**

Injection, powder for reconstitution, somatropin (rbe), net price 4-mg (12-unit) vial (with diluent) = £81.32. For use with **ZomaJet**[®] 2 **JMS** needle-free device or with **Auto-Jector**[®] **JMS** (both available free of charge from clinics) or with needles and syringes. For subcutaneous injection
Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 3)

Hypothalamic hormones

Gonadorelin when injected intravenously in post-pubertal girls leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. It is used in the assessment of delayed or precocious puberty.

Protirelin is a hypothalamic releasing hormone which stimulates the release of thyrotrophin from the pituitary. It is indicated for the diagnosis of mild hyperthyroidism or hypothyroidism, but its use has been superseded by immunoassays for thyroid-stimulating hormone. Together with other tests protirelin may also be used to confirm hypopituitarism and hypothalamic disease in children with marginally lowered thyrotrophin.

Other growth hormone stimulation tests involve the use of insulin, glucagon, arginine, and clonidine [all unlicensed uses]. The tests should be carried out in specialist centres.

GONADORELIN

(Gonadotrophin-releasing hormone; GnRH; LH-RH)

Cautions pituitary adenoma

Contra-indications

Pregnancy avoid

Breast-feeding avoid

Side-effects rarely nausea, headache, abdominal pain, increased menstrual bleeding; rarely, hypersensitivity reaction on repeated administration of large doses; irritation at injection site

Licensed use not licensed for use in children under 1 year

Indication and dose

Assessment of anterior pituitary function; assessment of delayed puberty

• **By subcutaneous or intravenous injection**

Child 1–18 years 2.5 micrograms/kg (max. 100 micrograms) as a single dose

HRF[®] (Intrapharm) **PoM**

Injection, powder for reconstitution, gonadorelin. Net price 100-microgram vial (with diluent) = £13.72 (hosp. only)

Excipients include benzyl alcohol (avoid in neonates, see Excipients p. 3)

PROTIRELIN

(Thyrotrophin-releasing hormone; TRH)

Cautions severe hypopituitarism, myocardial ischaemia, bronchial asthma and obstructive airways disease

Pregnancy use with caution as limited information available

Breast-feeding breast enlargement and leakage of milk reported

Side-effects after rapid intravenous administration desire to micturate, flushing, dizziness, nausea, abnormal taste; transient increase in pulse rate and blood pressure; rarely bronchospasm

Indication and dose

Assessment of thyroid function and thyroid stimulating hormone reserve

• **By intravenous injection**

Neonate 1 microgram/kg as a single dose; dose may vary—consult local protocol

Child 1 month–18 years 1 microgram/kg (max. 200 micrograms) as a single dose; dose may vary—consult local protocol

Diagnosis of hypopituitarism and hypothalamic disease

• **By intravenous injection**

Neonate 7 micrograms/kg as a single dose (unlicensed dose); dose may vary—consult local protocol

Child 1 month–18 years 7 micrograms/kg (max. 200 micrograms) as a single dose (unlicensed dose); dose may vary—consult local protocol

Protirelin (Cambridge) **PoM**

Injection, protirelin 100 micrograms/mL. Net price 2-mL amp = £14.43

6.5.2 Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus Diabetes insipidus is caused by either a deficiency of anti-diuretic hormone (ADH, vasopressin) secretion (cranial, neurogenic, or pituitary diabetes insipidus) or by failure of the renal tubules to react to secreted anti-diuretic hormone (nephrogenic diabetes insipidus).

Vasopressin (anti-diuretic hormone, ADH) is used in the treatment of *pituitary diabetes insipidus* as its analogue **desmopressin**. Dosage is tailored to produce a regular diuresis every 24 hours to avoid water intoxication. Treatment may be required permanently or for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus; following an intramuscular or intranasal dose, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of pituitary diabetes insipidus. Failure to respond suggests nephrogenic diabetes insipidus. Fluid input must be managed carefully to avoid hyponatraemia; this test is not usually recommended in young children.

In *nephrogenic* and *partial pituitary diabetes insipidus* benefit may be gained from the paradoxical anti-diuretic effect of thiazides (section 2.2.1) e.g. chlorothiazide 10–20 mg/kg (max. 500 mg) twice daily.

Other uses Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's disease; it is also used to test fibrinolytic response. For a comment on use of desmopressin in nocturnal enuresis see section 7.4.2.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, before introducing more definitive treatment. Terlipressin, a derivative of vasopressin, and octreotide are used similarly but experience in children is limited.

VASOPRESSIN

Cautions heart failure, hypertension, asthma, epilepsy, migraine or other conditions which might be aggravated by water retention; renal impairment (see also Contra-indications); avoid fluid overload

Pregnancy oxytocic effect in third trimester

Breast-feeding not known to be harmful

Contra-indications vascular disease (especially disease of coronary arteries) unless extreme caution, chronic nephritis (until reasonable blood nitrogen concentrations attained)

Side-effects fluid retention, pallor, tremor, sweating, vertigo, headache, nausea, vomiting, belching, abdominal cramps, desire to defaecate, hypersensitivity reactions (including anaphylaxis), constriction of coronary arteries (may cause anginal attacks and myocardial ischaemia), peripheral ischaemia and rarely gangrene

Licensed use not licensed for use in children

Indication and dose

Adjunct in acute massive haemorrhage of gastro-intestinal tract or oesophageal varices (specialist use only)

- By continuous intravenous infusion (may also be infused directly into the superior mesenteric artery)

Child 1 month–18 years initially 0.3 units/kg (max. 20 units) over 20–30 minutes *then* 0.3 units/kg/hour, adjusted according to response (max. 1 unit/kg/hour); if bleeding stops, continue at same dose for 12 hours, then withdraw gradually over 24–48 hours; max. duration of treatment 72 hours

Administration for *intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9% to a concentration of 0.2–1 unit/mL

▲ Synthetic vasopressin

Pitressin[®] (Goldshield) (POM)

Injection, argipressin (synthetic vasopressin) 20 units/mL. Net price 1-mL amp = £17.14 (hosp. only)

DESMOPRESSIN

Cautions see under Vasopressin; less pressor activity, but still considerable caution in cardio-

vascular disease and in hypertension (not indicated for nocturnal enuresis or nocturia in these

◊ DESMOPRESSIN (continued)

circumstances); also considerable caution in cystic fibrosis; in nocturia and nocturnal enuresis limit fluid intake from 1 hour before dose until 8 hours afterwards; in nocturia periodic blood pressure and weight checks needed to monitor for fluid overload; **interactions:** Appendix 1 (desmopressin)

Renal impairment use with caution, antidiuretic effect reduced

Pregnancy small oxytocic effect in third trimester; increased risk of pre-eclampsia

Breast-feeding concentration too low to be harmful

For cautions specifically relating to the use of desmopressin in nocturnal enuresis see section 7.4.2

Hyponatraemic convulsions The CSM has advised that patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal). The risk of hyponatraemic convulsions can also be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants)

Contra-indications cardiac insufficiency and other conditions treated with diuretics; psychogenic polydipsia and polydipsia in alcohol dependence

Side-effects fluid retention, and hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake; stomach pain, headache, nausea, vomiting, allergic reactions, and emotional disturbance in children also reported; epistaxis, nasal congestion, rhinitis with nasal spray

Licensed use *intranasal* preparations not licensed for use in children for assessment of antidiuretic hormone secretion, for fibrinolytic response testing, or for haemophilia and von Willebrand's disease; *Desmomelt*® and *Desmotab*® not licensed for use in children for treatment of diabetes insipidus; *Octim*® preparations not licensed for use in children for renal function testing or for treatment or diagnosis of diabetes insipidus

Indication and dose

Assessment of antidiuretic hormone secretion (congenital deficiency suspected) (specialist use only)

- **Intranasally**

Child 1 month–2 years initially 100–500 nanograms as a single dose

Assessment of antidiuretic hormone secretion (congenital deficiency not suspected) (specialist use only)

- **Intranasally**

Child 1 month–2 years 1–5 micrograms as a single dose

Test for suspected diabetes insipidus (water deprivation test) (specialist use only)

- **Intranasally**

Neonate not recommended, use trial of treatment

Child 1 month–2 years 5–10 micrograms as a single dose; not usually recommended, see notes above

Child 2–12 years 10–20 micrograms as a single dose, see notes above

Child 12–18 years 20 micrograms as a single dose, see notes above

- **By subcutaneous or intramuscular injection**

Neonate not recommended, use trial of treatment

Child 1 month–2 years 400 nanograms as a single dose; not usually recommended, see notes above

Child 2–12 years 0.5–1 microgram as a single dose, see notes above

Child 12–18 years 1–2 micrograms as a single dose, see notes above

Diabetes insipidus, treatment (specialist use only)

- **By mouth**
(as desmopressin acetate)

Neonate initially 1–4 micrograms 2–3 times daily, adjusted according to response

Child 1 month–2 years initially 10 micrograms 2–3 times daily, adjusted according to response (range 30–150 micrograms daily)

Child 2–12 years initially 50 micrograms 2–3 times daily, adjusted according to response (range 100–800 micrograms daily)

Child 12–18 years initially 100 micrograms 2–3 times daily, adjusted according to response (range 0.2–1.2 mg daily)

- **Sublingually**
(as desmopressin base)

Child 2–18 years initially 60 micrograms 3 times daily, adjusted according to response (range 40–240 micrograms 3 times daily)

- **Intranasally**
(as desmopressin acetate)

Neonate initially 100–500 nanograms, adjusted according to response (range 1.25–10 micrograms daily in 1–2 divided doses)

Child 1 month–2 years initially 2.5–5 micrograms 1–2 times daily, adjusted according to response

Child 2–12 years initially 5–20 micrograms 1–2 times daily, adjusted according to response

Child 12–18 years initially 10–20 micrograms 1–2 times daily, adjusted according to response

▮ DESMOPRESSIN (continued)

- By subcutaneous or intramuscular injection

Neonate initially 100 nanograms once daily, adjusted according to response (intramuscular route only)

Child 1 month–12 years initially 400 nanograms once daily, adjusted according to response

Child 12–18 years initially 1–4 micrograms once daily, adjusted according to response

Primary nocturnal enuresis (if urine concentrating ability normal) (specialist use only)

- By mouth

(as desmopressin acetate)

Child 5–18 years (preferably over 7 years) 200 micrograms at bedtime, increased to 400 micrograms at bedtime only if lower dose not effective (**important**: see also Cautions); reassess after 3 months by withdrawing treatment for at least 1 week

- Sublingually

(as desmopressin base)

Child 5–18 years (preferably over 7 years) 120 micrograms at bedtime, increased to 240 micrograms at bedtime only if lower dose not effective (**important**: see also Cautions); reassess after 3 months by withdrawing treatment for at least 1 week

Fibrinolytic response testing (specialist use only)

- By intravenous injection over 20 minutes or by subcutaneous injection

Child 2–18 years 300 nanograms/kg as a single dose; blood sampled after 20 minutes for fibrinolytic activity

Mild to moderate haemophilia and von Willebrand's disease (specialist use only)

- By intravenous infusion over 20 minutes or by subcutaneous injection

Child 1 month–18 years 300 nanograms/kg as a single dose immediately before surgery or after trauma; may be repeated at intervals of 12 hours if no tachycardia

- Intranasally

Child 1–18 years 4 micrograms/kg as a single dose, for pre-operative use give 2 hours before procedure

Renal function testing (specialist use only)

- Intranasally

Child 1 month–1 year 10 micrograms (empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload)

Child 1–15 years 20 micrograms (empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload)

Child 15–18 years 40 micrograms (empty bladder at time of administration and restrict

fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload)

- By subcutaneous or intramuscular injection

Child 1 month–1 year 400 nanograms (empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload)

Child 1–18 years 2 micrograms (empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload)

Desmopressin acetate (Non-proprietary) (POM)

Nasal spray, desmopressin acetate 10 micrograms/metered spray, net price 6-mL unit (60 metered sprays) = £27.04. Counselling, fluid intake, see above

Brands include *Presinex*[®]

Note Children requiring dose of less than 10 micrograms should be given *DDAVP*[®] intranasal solution

DDAVP[®] (Ferring) ▼ (POM)

Tablets, both scored, desmopressin acetate 100 micrograms, net price 90-tab pack = £45.48; 200 micrograms, 90-tab pack = £90.96. Counselling, fluid intake, see above

Note Tablets may be crushed

Sublingual tablets, (DDAVP[®] Melt), desmopressin (as acetate) 60 micrograms, net price 100-tab pack = £50.53; 120 micrograms, 100-tab pack = £101.07; 240 micrograms, 100-tab pack = £202.14. Label: 26, counselling, fluid intake, see notes above

Intranasal solution, desmopressin acetate 100 micrograms/mL. Net price 2.5-mL dropper bottle and catheter = £9.72. Counselling, fluid intake, see above

Administration May be diluted with sodium chloride 0.9% to a concentration of 10 micrograms/mL

Injection, desmopressin acetate 4 micrograms/mL. Net price 1-mL amp = £1.10

Administration May be administered orally [unlicensed]; for intravenous infusion, to be diluted to a concentration not less than 1 microgram/mL as adheres to surfaces if very dilute; for higher doses used in mild to moderate haemophilia and von Willebrand's disease may be diluted with 30–50 mL sodium chloride 0.9% intravenous infusion

Desmotabs[®] (Ferring) (POM)

Tablets, scored, desmopressin acetate 200 micrograms, net price 30-tab pack = £30.34. Counselling, fluid intake, see above

Note tablets may be crushed

Desmomelt[®] (Ferring) ▼ (POM)

Sublingual tablets desmopressin (as acetate) 120 micrograms, net price 30-tab pack = £30.34; 240 micrograms, 30-tab pack = £60.68. Label: 26, counselling, fluid intake, see above

Desmospray[®] (Ferring) (POM)

Nasal spray, desmopressin acetate 10 micrograms/metered spray. Net price 6-mL unit (60 metered

◻ DESMOPRESSIN (continued)

sprays) = £26.04. Counselling, fluid intake, see above

Note Children requiring dose of less than 10 micrograms should be given *DDAVP® intranasal solution*

Low dose Desmospray® (PoM)

Nasal spray, desmopressin acetate 2.5 micrograms/metered spray

Available from Ferring on a named-patient basis

Octim® (Ferring) (PoM)

Nasal spray, desmopressin acetate 150 micrograms/metered spray, net price 2.5-mL unit (25 metered sprays) = £600.00. Counselling, fluid intake, see above

Injection, desmopressin acetate 15 micrograms/mL, net price 1-mL amp = £20.00

Administration for intravenous infusion dilute with 50 mL of Sodium Chloride 0.9% and give over 20 minutes

TERLIPRESSIN

Cautions see under Vasopressin

Contra-indications see under Vasopressin

Side-effects see under Vasopressin, but effects milder

Licensed use unlicensed for use in children

Indication and dose

Adjunct in acute massive haemorrhage of gastro-intestinal tract or oesophageal varices (specialist use only)

- By intravenous injection

Child 12–18 years initially 2 mg then 1–2 mg every 4–6 hours until bleeding is controlled; max. duration of treatment 72 hours

Glypressin® (Ferring) (PoM)

Injection, terlipressin, powder for reconstitution.

Net price 1-mg vial with 5 mL diluent = £19.44 (hosp. only)

6.6 Drugs affecting bone metabolism

6.6.1 Calcitonin

6.6.2 Bisphosphonates

The two main disorders of bone metabolism that occur in children are rickets and osteoporosis. The two most common forms of rickets are Vitamin D deficiency rickets (section 9.6.4) and hypophosphataemic rickets (section 9.5.2). See also calcium (section 9.5.1.1).

Osteoporosis

Osteoporosis in children may be primary (e.g. *osteogenesis imperfecta* and *idiopathic juvenile osteoporosis*), or secondary (e.g. due to inflammatory disorders, immobilisation, or corticosteroids); specialist management is required.

Corticosteroid-induced osteoporosis To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible.

6.6.1 Calcitonin

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. **Calcitonin (salmon)** (**salcatonin**, synthetic or recombinant salmon calcitonin) is used to lower the plasma-calcium concentration in some patients with hypercalcaemia (notably when associated with malignant disease).

CALCITONIN (SALMON)/SALCATONIN

Cautions history of allergy (skin test advised); renal impairment; heart failure; children—use for short periods only and monitor bone growth

Pregnancy avoid unless essential, toxicity in *animal* studies

Breast-feeding avoid unless essential, may inhibit lactation

Contra-indications hypocalcaemia

◊ CALCITONIN (SALMON)/SALCATONIN (continued)

Side-effects nausea, vomiting, diarrhoea, abdominal pain, flushing, dizziness, headache, taste disturbances; musculoskeletal pain; with nasal spray nose and throat irritation, rhinitis, sinusitis and epistaxis; *less commonly* diuresis, oedema, cough, visual disturbances, injection-site reactions, rash, hypersensitivity reactions including pruritus

Licensed use not licensed in children

Indication and dose

Hypercalcaemia (experience limited in children) (specialist use only)

• By subcutaneous or intramuscular injection

Child 1 month–18 years 2.5–5 units/kg every 12 hours, max. 400 units every 6–8 hours, adjusted according to response (no additional benefit with over 8 units/kg every 6 hours)

• By slow intravenous infusion

Child 1 month–18 years 5–10 units/kg over at least 6 hours

Osteoporosis (specialist use only)

Refer for specialist advice, experience very limited

Administration for intravenous infusion, dilute injection solution (e.g. 400 units in 500 mL) with Sodium Chloride 0.9% and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration—use diluted solution without delay

Miacalcic® (Novartis) (POM)

Nasal spray ▼, calcitonin (salmon) 200 units/metered spray, net price 2-mL unit (approx. 14 metered sprays) = £20.99

Injection, calcitonin (salmon) 50 units/mL, net price 1-mL amp = £4.27; 100 units/mL, 1-mL amp = £8.55; 200 units/mL, 2-mL vial = £30.75

6.6.2 Bisphosphonates

Bisphosphonates are adsorbed on to hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

A bisphosphonate such as **disodium pamidronate** is used in the management of severe forms of *osteogenesis imperfecta* and other causes of osteoporosis in children to reduce the number of fractures; the long-term effects of bisphosphonates in children have not been established. Single doses of bisphosphonates are also used to manage hypercalcaemia (section 9.5.1.2). Treatment should be initiated under specialist advice **only**.

Osteonecrosis of the jaw Osteonecrosis of the jaw has been reported in adult patients receiving intravenous bisphosphonates and, rarely, in those taking oral bisphosphonates. Adequate oral hygiene should be maintained during and after treatment with bisphosphonates. Ideally in children with concomitant risk factors (such as cancer, chemotherapy treatment, corticosteroid treatment, or poor oral hygiene), remedial dental work should be carried out before starting bisphosphonate treatment.

ALENDRONIC ACID

Cautions upper gastro-intestinal disorders (dysphagia, symptomatic oesophageal disease, gastritis, duodenitis, or ulcers—see also under Contra-indications and Side-effects); history (within 1 year) of ulcers, active gastro-intestinal bleeding, or surgery of the upper gastro-intestinal tract; correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting and monitor serum-calcium concentration during treatment; consider preventive dental treatment before initiating bisphosphonate (risk of osteonecrosis of the jaw, see notes above); exclude other causes of osteoporosis; atypical stress fractures reported (discontinue unless benefits of continued treatment clearly outweigh risks); **interactions:** Appendix 1 (bisphosphonates)

Renal impairment avoid if estimated glomerular filtration rate is less than 35 mL/minute/1.73 m²

Contra-indications abnormalities of oesophagus and other factors which delay emptying (e.g. stricture or achalasia), hypocalcaemia,

Pregnancy manufacturer advises avoid

Breast-feeding no information available

Side-effects oesophageal reactions (see below), abdominal pain and distension, dyspepsia, regurgitation, melaena, diarrhoea or constipation, flatulence, musculoskeletal pain, headache; *rarely* rash, pruritus, erythema, photosensitivity, uveitis, scleritis, transient decrease in serum phosphate; nausea, vomiting, gastritis, peptic ulceration, hypersensitivity reactions (including urticaria and angioedema), and atypical stress fractures with long term use also reported; myalgia, malaise, and fever at initiation of treatment; *very rarely* severe skin reactions (including Stevens-Johnson syndrome), osteonecrosis (see notes above)

Oesophageal reactions Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture

◊ ALENDRONIC ACID (continued)

and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain

Licensed use not licensed for use in children

Indication and dose

See notes above, specialist use only

Counselling Swallow the tablets whole with a full glass of water on an empty stomach at least 30 minutes before breakfast (and any other oral medication); stand or sit

upright for at least 30 minutes and do not lie down until after eating breakfast. Do not take the tablets at bedtime or before rising.

Fosamax® (MSD) (PoM)

Tablets, alendronic acid (as sodium alendronate) 10 mg, 28-tab pack = £23.12. Counselling, administration

Fosamax® Once Weekly (MSD) (PoM)

Tablets, alendronic acid (as sodium alendronate) 70 mg, net price 4-tab pack = £22.80. Counselling, administration

DISODIUM PAMIDRONATE

Disodium pamidronate was formerly called aminohydroxypropylidenediphosphonate disodium (APD)

Cautions cardiac disease; previous thyroid surgery (risk of hypocalcaemia); monitor serum electrolytes, calcium, and phosphate—possibility of convulsions due to electrolyte changes; ensure adequate hydration; avoid concurrent use with other bisphosphonates; consider preventive dental treatment before initiating bisphosphonate (risk of osteonecrosis of the jaw, see notes above); **interactions:** Appendix 1 (bisphosphonates)

Hepatic impairment manufacturer advises caution in severe impairment—no information available

Renal impairment monitor renal function in renal disease or predisposition to renal impairment (e.g. in tumour-induced hypercalcaemia)

Skilled tasks Patients should be warned against driving, cycling, or performing skilled tasks immediately after treatment (somnolence or dizziness can occur)

Contra-indications

Pregnancy manufacturer advises avoid—toxicity in animal studies

Breast-feeding manufacturer advises avoid

Side-effects hypophosphataemia, transient rise in body temperature, fever and influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue, and flushes); arthralgia, myalgia, bone pain, nausea, vomiting, headache, lymphocytopenia, hypomagnesaemia; rarely muscle

cramps, anorexia, abdominal pain, diarrhoea, constipation, dyspepsia, agitation, confusion, dizziness, insomnia, somnolence, lethargy, anaemia, leucopenia, hypotension or hypertension, rash, pruritus, symptomatic hypocalcaemia (paraesthesia, tetany), hyperkalaemia or hypokalaemia, hypernatraemia; osteonecrosis (see notes above); isolated cases of seizures, hallucinations, thrombocytopenia, haematuria, acute renal failure, deterioration of renal disease, conjunctivitis and other ocular symptoms; atrial fibrillation, and reactivation of herpes simplex and zoster also reported; also local reactions at injection site

Licensed use not licensed for use in children

Indication and dose

See notes above, specialist use only

Disodium pamidronate (Non-proprietary) (PoM)

Concentrate for intravenous infusion, disodium pamidronate 3 mg/mL, net price 5-mL vial = £27.50, 10-mL vial = £55.00; 6 mg/mL, 10-mL vial = £95.00; 9 mg/mL, 10-mL vial = £165.00

Aredia Dry Powder® (Novartis) (PoM)

Injection, powder for reconstitution, disodium pamidronate, for use as an infusion. Net price 15-mg vial = £29.83; 30-mg vial = £59.66; 90-mg vial = £170.45 (all with diluent)

RISEDRONATE SODIUM

Cautions oesophageal abnormalities and other factors which delay transit or emptying (e.g. stricture or achalasia—see also under Side-effects); correct hypocalcaemia before starting, correct other disturbances of bone and mineral metabolism (e.g. Vitamin-D deficiency) at onset of treatment; consider preventive dental treatment before initiating bisphosphonate (risk of osteonecrosis of the jaw, see notes above); **interactions:** Appendix 1 (bisphosphonates)

Renal impairment avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m²

Contra-indications hypocalcaemia (see Cautions above)

Pregnancy manufacturer advises avoid

Breast-feeding manufacturer advises avoid

Side-effects gastro-intestinal effects (including abdominal pain, dyspepsia, nausea, diarrhoea, constipation); dizziness, headache; influenza-like symptoms, musculoskeletal pain; rarely oesophageal stricture, oesophagitis, oesophageal ulcer, dysphagia, gastritis, duodenitis, glossitis, peripheral oedema, weight loss, myasthenia, arthralgia, apnoea, bronchitis, sinusitis, rash, nocturia, amblyopia, corneal lesion, dry eye, tinitus, iritis; very rarely hypersensitivity reactions including angioedema, osteonecrosis (see notes above)

Licensed use not licensed for use in children

Indication and dose

See notes above, specialist use only

Counselling Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes

⚠ RISEDRONATE SODIUM (continued)

before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium containing products e.g. milk, also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising

Actonel® (Procter & Gamble Pharm.) (POM)

Tablets, f/c, risedronate sodium 5 mg (yellow), net price 28-tab pack = £19.10; 30 mg (white), 28-tab

pack = £152.81. Counselling, administration, food, and calcium (see above)

Actonel Once a Week® (Procter & Gamble Pharm.) (POM)

Tablets, f/c, risedronate sodium 35 mg (orange), net price 4-tab pack = £20.30. Counselling, administration, food and calcium (see above)

SODIUM CLODRONATE

Cautions monitor renal and hepatic function and white cell count; also monitor serum calcium and phosphate periodically; renal dysfunction reported in patients receiving concomitant NSAIDs; maintain adequate fluid intake during treatment; consider preventive dental treatment before initiating bisphosphonate (risk of osteonecrosis of the jaw, see notes above); **interactions:** Appendix 1 (bisphosphonates)

Renal impairment use half normal dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Contra-indications acute gastro-intestinal inflammatory conditions

Pregnancy manufacturer advises avoid

Breast-feeding no information available

Side-effects nausea, diarrhoea; skin reactions; bronchospasm; *very rarely* osteonecrosis (see notes above)

Licensed use not licensed for use in children

Indication and dose

See notes above, specialist use only

Counselling Avoid food for 1 hour before and after oral treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake

Bonafos® (Bayer) (POM)

Capsules, yellow, sodium clodronate 400 mg. Net price 120-cap pack = £161.97. Counselling, food and calcium

Tablets, f/c, scored, sodium clodronate 800 mg. Net price 60-tab pack = £169.62. Counselling, food and calcium

Clasteon® (Beacon) (POM)

Capsules, blue/white, sodium clodronate 400 mg, net price 30-cap pack = £40.49, 120-cap pack = £161.97. Counselling, food and calcium

Loron® (Roche) (POM)

Loron 520® tablets, f/c, scored, sodium clodronate 520 mg. Net price 60-tab pack = £161.99. Label: 10, patient information leaflet., Counselling, food and calcium

6.7 Other endocrine drugs

6.7.1 Bromocriptine and other dopaminergic drugs

6.7.2 Drugs affecting gonadotrophins

6.7.3 Metyrapone

6.7.4 Somatomedins

6.7.1 Bromocriptine and other dopaminergic drugs

Classification not used in BNF for Children

6.7.2 Drugs affecting gonadotrophins

Classification not used in BNF for Children. See section 6.4.3 for use in precocious puberty.

6.7.3 Metyrapone

Metyrapone is a competitive inhibitor of 11 β -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. It is used as a test of anterior pituitary function.

Most types of *Cushing's syndrome* are treated surgically. Metyrapone may be useful to control the symptoms of the disease or to prepare the child for surgery. The

dosages used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole (section 5.2) is also used by specialists for the management of *Cushing's syndrome* [unlicensed indication].

METYRAPONE

Cautions gross hypopituitarism (risk of precipitating acute adrenal failure); hypertension on long-term administration; hypothyroidism or hepatic impairment (delayed response); many drugs interfere with diagnostic estimation of steroids; avoid in acute porphyria (section 9.8.2)
Skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving)

Contra-indications adrenocortical insufficiency (see Cautions)

Pregnancy contra-indicated

Breast-feeding contra-indicated

Side-effects occasional nausea, vomiting, dizziness, headache, hypotension, sedation; rarely abdominal pain, allergic skin reactions, hypoadrenalism, hirsutism

Licensed use licensed for use in children

Indication and dose

Differential diagnosis of ACTH-dependent Cushing's syndrome

• By mouth

Child 1 month–18 years 15 mg/kg (or 300 mg/m²) every 4 hours for 6 doses; minimum dose 250 mg every 4 hours, max. 750 mg every 4 hours

Management of Cushing's syndrome

• By mouth

Range 250 mg–6 g daily, adjusted according to cortisol production; see notes above

Metopirone[®] (Alliance) [P_{MI}]

Capsules, ivory, metyrapone 250 mg. Net price 100-tab pack = £41.44. Label: 21, counselling, driving

6.7.4 Somatomedins

Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). **Mecasermin**, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotrophic effects of human growth hormone and is used to treat growth failure in children with severe primary insulin-like growth factor-I deficiency.

MECASERMIN

(Recombinant human insulin-like growth factor-I; rhIGF-I)

Cautions correct hypothyroidism before initiating treatment; diabetes mellitus (adjustment of anti-diabetic therapy may be necessary), monitor ECG before and on termination of treatment (and during treatment if ECG abnormal), papilloedema (see under Side-effects), monitor for disorders of the epiphysis of the hip (monitor for limping), monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions)

Pregnancy manufacturer advises avoid unless essential; contraception advised in women of child-bearing potential

Contra-indications evidence of tumour activity (discontinue treatment)

Breast-feeding manufacturer advises avoid

Side-effects headache, funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); cardiomegaly, ventricular hypertrophy, tachycardia; convulsions, sleep apnoea, night terrors, dizziness, nervousness; tonsillar hyper-

trophy (see Cautions above); hypoglycaemia (especially in first month, and in younger children), hyperglycaemia, gynaecomastia; arthralgia, myalgia; visual disturbance, impaired hearing; antibody formation; injection-site reactions (rotate site)

Indication and dose

Growth failure in children with severe primary insulin-like growth factor-I deficiency

• By subcutaneous injection

Child 2–18 years initially 40 micrograms/kg twice daily for 1 week, if tolerated increase dose in steps of 40 micrograms/kg to max. 120 micrograms/kg twice daily; discontinue if no response within 1 year

Counselling Dose should be administered just before or after food; do not increase dose if a dose is missed

Note Reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat

Increlex[®] (Ipsen) [P_{MI}]

Injection, mecasermin 10 mg/mL, net price 4-mL vial = £384.00. Counselling, administration
Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 3)

7.1 Drugs used in obstetrics

This section is not included in *BNF for Children*. See BNF for management of obstetrics.

For the management of ductus arteriosus, see section 2.14

7.2 Treatment of vaginal and vulval conditions

7.2.1 Preparations for vaginal and vulval changes

7.2.2 Vaginal and vulval infections

Pre-pubertal girls may be particularly susceptible to vulvovaginitis. Barrier preparations (section 13.2.2) applied after cleansing can be useful when the symptoms are due to non-specific irritation, but systemic drugs are required in the treatment of bacterial infection (section 5.1) or threadworm infestation (section 5.5.1). Intravaginal preparations, particularly those that require the use of an applicator, are not generally suitable for young girls; topical preparations may be useful in some adolescent girls.

In older girls symptoms are often restricted to the vulva, but infections almost invariably involve the vagina, which should also be treated; treatment should be as for adults (see BNF section 7.2).

7.2.1 Preparations for vaginal and vulval changes

Topical oestrogen creams containing **estriol** 0.01% (*Ortho-Gynest*[®]) are used in the treatment of labial adhesions (for details of preparation, see BNF section 7.2.1); treatment is usually restricted to symptomatic cases. Estriol cream should be applied to the adhesions once or twice daily for 2–6 weeks; adhesions may recur following treatment.

7.2.2 Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Vaginal fungal infections are not normally a problem in younger girls but can occur in adolescents. *Candidal vulvitis* can be treated locally with cream but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis*, rare in girls before puberty, can be treated with antifungal pessaries or cream inserted high into the vagina (including during menstruation), however, these are not recommended for pre-pubertal girls and treatment with an external cream may be more appropriate. Single-dose intravaginal preparations offer an advantage when compliance is a problem. Local irritation can occur on application of vaginal antifungal products.

Imidazole drugs (clotrimazole, econazole, and miconazole) are effective against candida in short courses of 1 to 3 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole (section 5.2) may be considered for girls post-puberty.

Vulvovaginal candidiasis in pregnancy Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. There is limited absorption of imidazoles from the skin and vagina. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis Recurrent vulvovaginal candidiasis is very rare in children, but can occur if there are predisposing factors such as antibacterial therapy, pregnancy, diabetes mellitus, and possibly oral contraceptive use. Reservoirs of infection can also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus, as well as the gastro-intestinal tract and the bladder. The sexual partner may also be the source of re-infection and, if symptomatic, should be treated with cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis. Some recommended regimens suitable for older children [all unlicensed] include:

- fluconazole (section 5.2) by mouth 100 mg (as a single dose) every week for 6 months
- clotrimazole vaginally 500-mg pessary (as a single dose) every week for 6 months.

PREPARATIONS FOR VAGINAL AND VULVAL CANDIDIASIS

Note Intravaginal preparations, particularly those that require use of an applicator, should be avoided in young girls unless there is no other alternative

Side-effects occasional local irritation

Licensed use consult product literature for the licensing status of individual preparations

Indication and dose

See notes above.

Clotrimazole (Non-proprietary)

Cream (topical), clotrimazole 1%, net price 20 g = £1.92, 50 g = £3.84

Condoms: effect on latex condoms and diaphragms not yet known

Dose

Apply to anogenital area 2–3 times daily

Pessary, clotrimazole 500 mg, net price 1 pessary with applicator = £3.16

Dose

Insert 1 pessary at night as a single dose; can be repeated once if necessary

Canesten® (Bayer Consumer Care)

Cream (topical), clotrimazole 1%. Net price 20 g = £2.14; 50 g = £3.80

Excipients include benzyl alcohol, cetostearyl alcohol, poly-sorbates

Condoms: damages latex condoms and diaphragms

Dose

Apply to anogenital area 2–3 times daily

PREPARATIONS FOR VAGINAL AND VULVAL CANDIDIASIS (continued)

Thrush Cream (topical), clotrimazole 2%, net price 20 g = £3.99

Excipients include benzyl alcohol, cetostearyl alcohol, poly-sorbates

Condoms: damages latex condoms and diaphragms

Dose

Apply to anogenital area 2–3 times daily

Vaginal cream (10% VC®) (PoM), clotrimazole 10%.

Net price 5-g applicator pack = £5.62

Excipients include benzyl alcohol, cetostearyl alcohol, poly-sorbates

Condoms: damages latex condoms and diaphragms

Dose

Insert 5 g at night as a single dose; may be repeated once if necessary

Note Brands for sale to the public include *Canesten® Internal Cream*

Cream Combi, clotrimazole 10% vaginal cream and 2% topical cream, net price 5-g vaginal cream (with applicator) and 10-g topical cream = £5.76

Excipients include benzyl alcohol, cetostearyl alcohol, poly-sorbates

Condoms: damages latex condoms and diaphragms

Dose

See under individual components

Pessaries, clotrimazole 200 mg, 3 pessaries with applicator = £3.63

Condoms: damages latex condoms and diaphragms

Dose

Insert 200 mg for 3 nights; course may be repeated once if necessary

Pessary, clotrimazole 500 mg. Net price 1 with applicator = £3.25

Excipients none as listed in section 13.1.3

Condoms: damages latex condoms and diaphragms

Dose

Insert 1 pessary at night as a single dose; may be repeated once if necessary

Combi, clotrimazole 500-mg pessary and cream (topical) 2%. Net price 1 pessary and 10-g cream = £5.21

Condoms: damages latex condoms and diaphragms

Dose

See under individual components

Ecostatin® (Squibb)

Cream (topical), econazole nitrate 1%. Net price 15 g = £1.49; 30 g = £2.75

Excipients include butylated hydroxyanisole, fragrance

Condoms: damages latex condoms and diaphragms

Dose

Apply to anogenital area twice daily

Pessaries (PoM), econazole nitrate 150 mg. Net price 3 with applicator = £3.35

Excipients none as listed in section 13.1.3

Condoms: damages latex condoms and diaphragms

Dose

Insert 1 pessary for 3 nights; course may be repeated once if necessary

Pessary (Ecostatin 1®) (PoM), econazole nitrate

150 mg, formulated for single-dose therapy. Net price 1 pessary with applicator = £3.35

Excipients none as listed in section 13.1.3

Condoms: damages latex condoms and diaphragms

Dose

Insert 1 pessary at night as a single dose; may be repeated once if necessary

Twinpack (PoM), econazole nitrate 150-mg pessaries and cream 1%. Net price 3 pessaries and 15 g cream = £4.35

Condoms: damages latex condoms and diaphragms

Dose

See under individual components

Gyno-Daktarin® (Janssen-Cilag) (PoM)

Ovule (= vaginal capsule) (*Gyno-Daktarin 1®*), miconazole nitrate 1.2 g in a fatty basis. Net price 1 ovule = £3.12

Excipients include hydroxybenzoates (parabens)

Condoms: damages latex condoms and diaphragms

Dose

Insert 1 ovule at night as a single dose; can be repeated once if necessary

Gyno-Pevaryl® (Janssen-Cilag) (PoM)

Pessaries, econazole nitrate 150 mg. Net price 3 pessaries = £2.95

Excipients none as listed in section 13.1.3

Condoms: damages latex condoms and diaphragms

Dose

Insert 1 pessary for 3 nights; course can be repeated once if necessary

Pessary (Gyno-Pevaryl 1®), econazole nitrate

150 mg, formulated for single-dose therapy. Net price 1 pessary with applicator = £3.13

Excipients none as listed in section 13.1.3

Condoms: damages latex condoms and diaphragms

Dose

Insert 1 pessary at night as a single dose; can be repeated once if necessary

Nizoral® (Janssen-Cilag) (PoM)

Cream (topical), ketoconazole 2%. Net price 30 g = £3.54

Excipients include polysorbates, propylene glycol, stearyl alcohol

Condoms: effect on latex condoms and diaphragms not yet known

Dose

Apply to anogenital area once or twice daily

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole (section 5.1.11) or tinidazole (section 5.4.2).

Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective.

tive against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream and metronidazole gel are indicated for bacterial vaginosis.

The antiviral drugs aciclovir, famciclovir, and valaciclovir can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration. They have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms. See section 5.3 for systemic preparations, and section 13.10.3 for topical preparations.

PREPARATIONS FOR OTHER VAGINAL INFECTIONS

Dalacin® (Pharmacia) (PwM)

Cream, clindamycin 2% (as phosphate). Net price 40-g pack with 7 applicators = £10.86

Excipients include benzyl alcohol, cetostearyl alcohol, poly-sorbates, propylene glycol

Condoms: damages latex condoms and diaphragms

Side-effects irritation, cervicitis and vaginitis; poorly absorbed into the blood—very low likelihood of systemic effects (section 5.1.6)

Licensed use Not licensed for use in pre-pubertal children

Dose

Bacterial vaginosis

Insert 5-g applicatorful at night for 3–7 nights

Zidoval® (3M) (PwM)

Vaginal gel, metronidazole 0.75%. Net price 40-g pack with 5 applicators = £4.31

Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol

Cautions not recommended during menstruation; some absorption may occur, see section 5.1.11 for systemic effects

Side-effects local effects including irritation, candidiasis, abnormal discharge, pelvic discomfort

Licensed use Not licensed for use in pre-pubertal children

Dose

Bacterial vaginosis

Insert 5-g applicatorful at night for 5 nights

7.3 Contraceptives

- 7.3.1 Combined hormonal contraceptives
- 7.3.2 Progestogen-only contraceptives
- 7.3.3 Spermicidal contraceptives
- 7.3.4 Contraceptive devices
- 7.3.5 Emergency contraception

The Fraser Guidelines¹ should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.ffprhc.org.uk) is published by The Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but has major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be very reliable for well-motivated couples if used in conjunction with a **spermicide**. Occasionally sensitivity reactions occur. A female condom (*Femidom*®) is also available; it is prelubricated but does not contain a spermicide.

7.3.1 Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen ('combined oral contraceptives') are the most effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

1. See Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health. Available at www.dh.gov.uk

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones according to the stage of the cycle are termed 'biphasic' and 'triphasic'. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen are also available.

Choice The oestrogen content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen.

- *Low strength preparations* (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- *Standard strength preparations* (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram *phased* preparations) are appropriate for standard use—but see Risk of Venous Thromboembolism below. Phased preparations are generally reserved for women who *either* do not have withdrawal bleeding *or* who have breakthrough bleeding with monophasic products.

The progestogens desogestrel, drospirenone, and gestodene (in combination with ethinylestradiol) may be considered for women who have side-effects (such as acne, headache, depression, weight gain, breast symptoms, and breakthrough bleeding) with other progestogens. However, women should be advised that desogestrel and gestodene have also been associated with an increased risk of *venous thromboembolism*. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch.

The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol.

Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease (particularly during the first year) in users of oral contraceptives but this risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors for venous thromboembolism (e.g. obesity).

The incidence of venous thromboembolism in healthy, non-pregnant women who are not taking an oral contraceptive is about 5–10 cases per 100 000 women per year. For those using combined oral contraceptives containing second-generation progestogens e.g. levonorgestrel, this incidence is about 15 per 100 000 women per year of use. The risk of venous thromboembolism with transdermal patches may be slightly increased compared with combined oral contraceptives that contain levonorgestrel. Some studies have reported a greater risk of venous thromboembolism in women using combined oral contraceptives containing the third-generation progestogens desogestrel and gestodene; the incidence in these women is about 25 per 100 000 women per year of use. The absolute risk of venous thromboembolism in women using combined oral contraceptives containing these third-generation progestogens is very small and well below the risk associated with pregnancy. The incidence of venous thromboembolism in women using a combined oral contraceptive containing drospirenone is the same range as that for users of combined oral contraceptives containing other progestogens, including levonorgestrel. The risk of venous thromboembolism with vaginal ring use compared to the risk with other combined hormonal contraceptives is unknown.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Travel Women taking oral contraceptives, or using the patch, or vaginal ring are at an increased risk of deep-vein thrombosis during travel involving long periods

of immobility (over 5 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Missed pill The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning or end* of a cycle (which lengthens the pill-free interval). If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets).

Emergency contraception (section 7.3.5) is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Note The Faculty of Sexual and Reproductive Healthcare offers 2 different types of missed pill advice depending on the ethinylestradiol content of the contraceptive pill. The missed pill information above offers the same advice regardless of the ethinylestradiol content of the contraceptive pill; it is a simplified, more cautious version of advice issued by The Faculty of Sexual and Reproductive Healthcare.

Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual change day. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If intercourse has occurred during this extended patch-free interval, a possibility of fertilisation should be considered. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch change day remains the same and no additional contraception is required.
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for *less than 3 hours*, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for *more than 3 hours* or if the user is not aware when the ring was expelled, contraceptive protection may be reduced:

- if ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days
- if ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days prior to expulsion

If insertion of a new ring at the start of a new cycle is delayed, contraceptive

protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if the removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery (see also under Missed pill, above). If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

Interactions The effectiveness of both *combined* and *progestogen-only* oral contraceptives can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine, griseofulvin, modafinil, nelfinavir, nevirapine, oxcarbazepine, phenytoin, phenobarbital, primidone, ritonavir, St John's Wort, topiramate, and, above all, rifabutin and rifampicin). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

For a *short course of an enzyme-inducing drug*, the dose of combined oral contraceptives should be adjusted to provide ethinylestradiol 50 micrograms or more daily [unlicensed use]; furthermore, additional contraceptive precautions should be taken whilst taking the enzyme-inducing drug and for 4 weeks after stopping it.

Women requiring a *long-term course of an enzyme-inducing drug* should be encouraged to consider a contraceptive method that is unaffected by the interacting drug. In women unable to use an alternative method of contraception (for rifampicin and rifabutin see also below), a regimen of combined oral contraceptives should be taken which provides a daily intake of ethinylestradiol 50 micrograms or more [unlicensed use]; 'tricycling' (i.e. taking 3 or 4 packets of monophasic tablets without a break followed by a short tablet-free interval of 4 days) is recommended (but women should be warned of uncertainty about the effectiveness of this regimen). **Rifampicin** and **rifabutin** are such potent enzyme-inducing drugs that an alternative method of contraception (such as an IUD) is **always** recommended. Since enzyme activity does not return to normal for several weeks after stopping an enzyme-inducing drug, appropriate contraceptive measures are required for 4 to 8 weeks after stopping.

The effectiveness of contraceptive patches and vaginal rings can also be reduced by drugs that induce hepatic enzyme activity. Additional contraceptive precautions are required whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately without a patch-free or ring-free break. For women taking enzyme-inducing drugs over a long period, another method of contraception should be considered.

Some antibacterials that do not induce liver enzymes (e.g. ampicillin, doxycycline) may reduce the efficacy of *combined* oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. Additional contraceptive precautions should be taken whilst taking a short course of an antibacterial drug that is not enzyme-inducing and for 7 days after stopping. If these 7 days run beyond the end of a packet the next packet should be started immediately without a break (in the case of ED tablets the inactive ones should be omitted). If the antibacterial course *exceeds 3 weeks*, the bacterial flora develop antibacterial resistance and additional precautions become unnecessary unless a new antibacterial is prescribed; additional precautions are also unnecessary if a

woman starting a *combined* oral contraceptive has been on a course of antibacterial therapy for 3 weeks or more.

It is possible that some antibacterials affect the efficacy of contraceptive patches and vaginal rings. Additional contraceptive precautions are recommended during concomitant use and for 7 days after discontinuation of an antibacterial that is not enzyme-inducing (except tetracycline with contraceptive patch use, and amoxicillin or doxycycline with vaginal ring use). If concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately without a patch-free or ring-free break. If the antibacterial course exceeds 3 weeks, additional precautions become unnecessary unless a new antibacterial is prescribed; additional precautions are also unnecessary if a woman starting a contraceptive patch or vaginal ring has been on a course of antibacterial therapy for 3 weeks or more.

Surgery Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A depot injection of a progestogen-only contraceptive may be offered and the oestrogen-containing contraceptive restarted later—if preferred before the next injection would be due. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives (whether by mouth or by injection).

Reason to stop immediately Combined hormonal contraceptives should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- very high blood pressure;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment (see Cautions and Contraindications under Combined Hormonal Contraceptives below).

COMBINED HORMONAL CONTRACEPTIVES

Cautions see notes above; also risk factors for venous thromboembolism (see below and also notes above), arterial disease and migraine, see below; personal or family history of hypertriglyceridaemia (increased risk of pancreatitis); hyperprolactinaemia (seek specialist advice); history of severe depression especially if induced by hormonal contraceptive; undiagnosed breast mass; gene mutations associated with breast cancer (e.g. BRCA 1); sickle-cell disease; inflammatory bowel disease including Crohn's disease; reduced efficacy of contraceptive patch in women with body-weight ≥ 90 kg; **interactions:** see above and Appendix 1 (oestrogens, progestogens)

Risk factors for venous thromboembolism See also notes above. Use with **caution** if any of following factors present but **avoid** if two or more factors present:

- *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- *obesity*—caution if overweight according to BMI (adjusted for age and gender), avoid if obese;
- *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- *history of superficial thrombophlebitis*;
- *smoking*.

Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:

- *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);

COMBINED HORMONAL CONTRACEPTIVES (continued)

- *diabetes mellitus* (avoid if diabetes complications present);
- *hypertension* (avoid if blood pressure very high);
- *smoking* (avoid if smoking 40 or more cigarettes daily);
- *obesity*—caution if overweight according to BMI (adjusted for age and gender), avoid if obese;
- *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour—see also Reason to stop immediately in notes above)

Contra-indications see notes above; also personal history of venous or arterial thrombosis, severe or multiple risk factors for arterial disease or for venous thromboembolism (see above), heart disease associated with pulmonary hypertension or risk of embolus; sclerosing treatment for varicose veins; migraine (but see above); transient cerebral ischaemic attacks without headaches; systemic lupus erythematosus; acute porphyria (section 9.8.2); gallstones; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration); history of haemolytic uraemic syndrome or history during pregnancy of chorea, pemphigoid gestationis; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable; undiagnosed vaginal bleeding

Hepatic impairment avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours, and if history of pruritus or cholestatic jaundice during pregnancy

Pregnancy avoid but epidemiological evidence for combined oral contraceptives suggests no harmful effects on fetus

Breast-feeding avoid until weaning or for 6 months after birth (adverse effects on lactation)

Side-effects see notes above; also nausea, vomiting, abdominal cramps, changes in body-weight, liver impairment, hepatic tumours; fluid retention, thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB; see also notes above), hypertension, changes in lipid metabolism; headache, depression, chorea, nervousness, irritability; changes in libido, breast tenderness, enlargement, and secretion; reduced menstrual loss, 'spotting' in early cycles, absence of withdrawal bleeding, amenorrhoea after discontinuation, changes in vaginal discharge, cervical erosion; contact lenses may irritate, visual disturbances; leg cramps; skin reactions, chloasma, photosensitivity; rarely gallstones and systemic lupus erythematosus

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for

diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The risk of cervical cancer with transdermal patches and vaginal rings is not yet known

Note The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium

Licensed use consult product literature for the licensing status of individual preparations

Indication and dose

Contraception, menstrual symptoms (section 6.4.1.2)

• By mouth

Each tablet should be taken at approximately same time each day; if delayed by longer than 24 hours contraceptive protection may be lost

21-day combined (monophasic) preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); first course usually started on day 1 of cycle—if starting on day 4 of cycle or later, additional precautions (barrier methods) necessary during first 7 days

Every day (ED) combined (monophasic) preparations, 1 active tablet starting on day 1 of cycle (see also under preparations below)—if starting on day 4 of cycle or later, additional precautions (barrier methods) necessary during first 7 days; withdrawal bleeding occurs when inactive tablets being taken; subsequent courses repeated without interval

Biphasic and triphasic preparations, see under individual preparations below

Changing to combined preparation containing different progestogen *21-day combined preparations*: continue current pack until last tablet and start first tablet of new brand the next day. If a 7-day break is taken before starting new brand, additional precautions (barrier methods) should be used during first 7 days of taking the new brand.

Every Day (ED) combined preparations: start the new brand (first tablet of a 21-day preparation or the first active tablet of an ED preparation) the day after taking the last active tablet of previous brand (omitting the inactive tablets).

Changing from progestogen-only tablet Start on day 1 of menstruation or any day if amenorrhoea present and pregnancy has been excluded.

Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days.

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days.

Not recommended if woman breast-feeding—oral progestogen-only contraceptive preferred.

After abortion or miscarriage Start same day.

COMBINED HORMONAL CONTRACEPTIVES (continued)

• By transdermal application

Apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle

Note If first patch applied later than day 1, additional precaution (abstinence or barrier methods) should be used for the next 7 days

Changing from combined oral contraception Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days

Changing from progestogen-only method From an implant, apply first patch on the day implant removed; from an injection, apply first patch when next injection due; from oral progestogen, first patch may be started on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days

After abortion or miscarriage Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch

• By vagina

Insert ring into vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs)

Note If first ring inserted later than day 1, additional precaution (abstinence or barrier methods) should be used for the next 7 days

Changing from combined hormonal contraception Insert the ring at the latest on the day after the usual tablet-free, patch-free, or placebo-tablet interval. If previous contraceptive used correctly and pregnancy unlikely, can switch to ring on any day of cycle

Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when injection next due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

After first trimester abortion Start immediately

After childbirth (not breast-feeding) or second trimester abortion Start 4 weeks after birth or abortion; if started later than 4 weeks after birth or abortion additional precautions (barrier methods) should be used for first 7 days

Low strength (oral)

▲ Ethinylestradiol with Norethisterone

Loestrin 20® (Galen) ^(PmM)

Tablets, blue, norethisterone acetate 1 mg, ethinylestradiol 20 micrograms. Net price 3 × 21-tab pack = £2.70

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

▲ Ethinylestradiol with Desogestrel

See Risk of Venous Thromboembolism in notes above before prescribing

Mercilon® (Organon) ^(PmM)

Tablets, desogestrel 150 micrograms, ethinylestradiol 20 micrograms. Net price 3 × 21-tab pack = £7.97

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

▲ Ethinylestradiol with Gestodene

See Risk of Venous Thromboembolism in notes above before prescribing

Femodette® (Schering Health) ^(PmM)

Tablets, s/c, gestodene 75 micrograms, ethinylestradiol 20 micrograms, net price 3 × 21-tab pack = £9.45

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Sunya 20/75® (Stragen) ^(PmM)

Tablets, s/c, gestodene 75 micrograms, ethinylestradiol 20 micrograms, net price 3 × 21-tab pack = £6.62

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Low strength (vaginal)

▲ Ethinylestradiol with Etonogestrel

NuvaRing® (Organon) ▼ ^(PmM)

Vaginal ring, releasing ethinylestradiol approx. 15 micrograms/24 hours and etonogestrel approx. 120 micrograms/24 hours, net price 3-ring pack = £27.00. Counselling, administration

Dose

1 ring to be inserted into the vagina for 3 weeks, removed on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Counselling The presence of the ring should be checked regularly. In case of expulsion see Expulsion, Delayed Insertion or Removal, or Broken Vaginal Ring, p. 477

Standard strength (oral)

▲ Ethinylestradiol with Levonorgestrel

Logynon® (Schering Health) ^(PmM)

6 light brown tablets, ethinylestradiol 30 micrograms, levonorgestrel 50 micrograms;
5 white tablets, ethinylestradiol 40 micrograms, levonorgestrel 75 micrograms;

COMBINED HORMONAL CONTRACEPTIVES (continued)

10 ochre tablets, ethinylestradiol 30 micrograms, levonorgestrel 125 micrograms.
Net price 3 × 21-tab pack = £4.12

Dose

1 tablet daily for 21 days, starting with light brown tablet marked 1 on day 1 of cycle; repeat after 7-day tablet-free interval

Logynon ED® (Schering Health) (POM)

6 light brown tablets, ethinylestradiol 30 micrograms, levonorgestrel 50 micrograms;
5 white tablets, ethinylestradiol 40 micrograms, levonorgestrel 75 micrograms;
10 ochre tablets, ethinylestradiol 30 micrograms, levonorgestrel 125 micrograms;
7 white, inactive tablets.
Net price 3 × 28-tab pack = £4.12

Dose

1 tablet daily for 28 days, starting on day 1 of cycle with active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval; for starting routines see under Dose above

Microgynon 30® (Schering Health) (POM)

Tablets, s/c, levonorgestrel 150 micrograms, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £2.99

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Microgynon 30 ED® (Schering Health) (POM)

Tablets, beige, levonorgestrel 150 micrograms, ethinylestradiol 30 micrograms, white inactive tablets. Net price 3 × 28-tab (7 are inactive) pack = £2.69

Dose

1 tablet daily for 28 days starting on day 1 of cycle with active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval; for starting routines see also under Dose above

Ovranette® (Wyeth) (POM)

Tablets, levonorgestrel 150 micrograms, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £2.29

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Ethinylestradiol with Norethisterone

BiNovum® (Janssen-Cilag) (POM)

7 white tablets, ethinylestradiol 35 micrograms, norethisterone 500 micrograms;
14 peach tablets, ethinylestradiol 35 micrograms, norethisterone 1mg.
Net price 3 × 21-tab pack = £2.08

Dose

1 tablet daily for 21 days, starting with white tablet on day 1 of cycle; repeat after 7-day tablet-free interval

Brevinor® (Pharmacia) (POM)

Tablets, blue, norethisterone 500 micrograms, ethinylestradiol 35 micrograms. Net price 3 × 21-tab pack = £1.99

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Loestrin 30® (Galen) (POM)

Tablets, pale green, norethisterone acetate 1.5 mg, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £3.90

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Norimin® (Pharmacia) (POM)

Tablets, norethisterone 1 mg, ethinylestradiol 35 micrograms. Net price 3 × 21-tab pack = £2.28

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Ovysmen® (Janssen-Cilag) (POM)

Tablets, norethisterone 500 micrograms, ethinylestradiol 35 micrograms. Net price 3 × 21-tab pack = £1.58

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Synphase® (Pharmacia) (POM)

7 blue tablets, ethinylestradiol 35 micrograms, norethisterone 500 micrograms;
9 white tablets, ethinylestradiol 35 micrograms, norethisterone 1 mg;
5 blue tablets, ethinylestradiol 35 micrograms, norethisterone 500 micrograms.
Net price 21-tab pack = £1.20

Dose

1 tablet daily for 21 days, starting with blue tablet marked 1 on day 1 of cycle; repeat after 7-day tablet-free interval

TriNovum® (Janssen-Cilag) (POM)

7 white tablets, ethinylestradiol 35 micrograms, norethisterone 500 micrograms;
7 light peach tablets, ethinylestradiol 35 micrograms, norethisterone 750 micrograms;
7 peach tablets, ethinylestradiol 35 micrograms, norethisterone 1 mg.
Net price 3 × 21-tab pack = £2.89

Dose

1 tablet daily for 21 days, starting with white tablet on day 1 of cycle; repeat after 7-day tablet-free interval

◊ COMBINED HORMONAL CONTRACEPTIVES (continued)

■ Ethinylestradiol with Norgestimate

Cilest[®] (Janssen-Cilag) (POM)

Tablets, blue, norgestimate 250 micrograms, ethinylestradiol 35 micrograms. Net price 3 × 21-tab pack = £5.97, 6 × 21-tab pack = £11.94

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

■ Ethinylestradiol with Desogestrel

See Risk of Venous Thromboembolism in notes above before prescribing

Marvelon[®] (Organon) (POM)

Tablets, desogestrel 150 micrograms, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £6.70

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

■ Ethinylestradiol with Drospirenone

Yasmin[®] (Bayer) (POM)

Tablets, f/c, yellow, drospirenone 3 mg, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £14.70

Cautions use with care if increased concentration of plasma-potassium might be hazardous; renal impairment—avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Note The *Scottish Medicines Consortium* has advised (March 2003) that *Yasmin*[®] is not recommended

■ Ethinylestradiol with Gestodene

See Risk of Venous Thromboembolism in notes above before prescribing

Femodene[®] (Schering Health) (POM)

Tablets, s/c, gestodene 75 micrograms, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £7.18

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Femodene[®] ED (Schering Health) (POM)

Tablets, s/c, gestodene 75 micrograms, ethinylestradiol 30 micrograms. Net price 3 × 28-tab (7 are inactive) pack = £7.18

Dose

1 tablet daily for 28 days, starting on day 1 of cycle with active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval; for starting routines see under Dose above

Katya 30/75[®] (Stragen) (POM)

Tablets, s/c, gestodene 75 micrograms, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £5.03

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Triadene[®] (Schering Health) (POM)

6 beige tablets, ethinylestradiol 30 micrograms, gestodene 50 micrograms;

5 dark brown tablets, ethinylestradiol 40 micrograms, gestodene 70 micrograms;

10 white tablets, ethinylestradiol 30 micrograms, gestodene 100 micrograms.

Net price 3 × 21-tab pack = £9.54

Dose

1 tablet daily for 21 days, starting with beige tablet marked 'start' on day 1 of cycle; repeat after 7-day tablet-free interval

■ Mestranol with Norethisterone

Norinyl-1[®] (Pharmacia) (POM)

Tablets, norethisterone 1 mg, mestranol 50 micrograms. Net price 3 × 21-tab pack = £2.19

Dose

1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

■ Ethinylestradiol with cyproterone acetate

See Co-cyprindiol (section 13.6.2)

Standard strength (transdermal)

■ Ethinylestradiol with Norelgestromin

Evra[®] (Janssen-Cilag) (POM)

Patches, self-adhesive (releasing ethinylestradiol approx. 33.9 micrograms/24 hours and norelgestromin approx. 203 micrograms/24 hours); net price 9-patch pack = £16.26. Counselling, administration

Dose

1 patch to be applied once weekly for three weeks, followed by a 7-day patch-free interval; subsequent courses repeated after 7-day patch-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Note Adhesives or bandages should not be used to hold patch in place. If patch no longer sticky do not reapply but use a new patch.

The *Scottish Medicines Consortium* has advised (September 2003) that *Evra*[®] patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives

7.3.2 Progesterone-only contraceptives

7.3.2.1 Oral progesterone-only contraceptives

7.3.2.2 Parenteral progesterone-only contraceptives

7.3.2.3 Intra-uterine progesterone-only device

7.3.2.1 Oral progesterone-only contraceptives

Oral progesterone-only preparations may offer a suitable alternative when oestrogens are contra-indicated (including those patients with venous thrombosis or a past history or predisposition to venous thrombosis), but have a higher failure rate than combined preparations. They are suitable for heavy smokers, and for those with hypertension, valvular heart disease, diabetes mellitus, and migraine. Menstrual irregularities (oligomenorrhoea, menorrhagia) are more common but tend to resolve on long-term treatment.

Interactions Effectiveness of oral progesterone-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progesterone-only preparations is, however, reduced by enzyme-inducing drugs and an additional or alternative contraceptive method is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards—see p. 478 and Appendix 1 (progesterogens).

Surgery All progesterone-only contraceptives (including those given by injection) are suitable for use as an alternative to combined oral contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours (12 hours for *Cerazette*®) contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Start any time after 3 weeks postpartum (increased risk of breakthrough bleeding if started earlier)—lactation is not affected.

Missed pill The following advice is now recommended by family planning organisations:

If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours (12 hours for *Cerazette*®) overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception (see p. 490) if one or more progesterone-only contraceptive tablets are missed or taken more than 3 hours (12 hours for *Cerazette*®) late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progesterone-only contraceptives. If vomiting occurs within 2 hours of taking an oral progesterone-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours (12 hours for *Cerazette*®) of the normal time for taking the progesterone-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery (see also under Missed pill above).

ORAL PROGESTERONE-ONLY CONTRACEPTIVES

(Progesterone-only pill, 'POP')

Cautions arterial disease; sex-steroid dependent cancer; past ectopic pregnancy; malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration); functional ovarian cysts; **interactions:** see notes above and Appendix 1 (progesterogens)

Hepatic impairment caution in active liver disease, recurrent cholestatic jaundice, and history of jaundice in pregnancy; avoid in liver tumour

Breast-feeding progesterone-only contraceptives do not affect lactation—start 3 weeks after birth or later

Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension,

◊ ORAL PROGESTOGEN-ONLY CONTRACEPTIVES (continued)

diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory

Contra-indications undiagnosed vaginal bleeding; severe arterial disease; acute porphyria (section 9.8.2); history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

Pregnancy avoid but epidemiological evidence suggests no harmful effects of oral contraceptives on fetus

Side-effects menstrual irregularities (see also notes above); nausea, vomiting, headache, dizziness, breast discomfort, depression, skin disorders, disturbance of appetite, weight changes, changes in libido

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. The CSM has advised that a possible small increase in the risk of breast cancer should be weighed against the benefits

Licensed use consult product literature for the licensing status of individual preparations

Indication and dose

Contraception

• By mouth

1 tablet daily at same time each day, starting on day 1 of cycle then continuously; if administration delayed for 3 hours (12 hours for *Cerazette*®) or more it should be regarded as a 'missed pill', see notes above

Cerazette® (Organon) (POM)

Tablets, f/c, desogestrel 75 micrograms. Net price 3 × 28-tab pack = £8.85

The *Scottish Medicines Consortium* has advised (September 2003) that *Cerazette*® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom these preparations are contra-indicated

Femulen® (Pharmacia) (POM)

Tablets, etynodiol diacetate 500 micrograms. Net price 3 × 28-tab pack = £3.31

Micronor® (Janssen-Cilag) (POM)

Tablets, norethisterone 350 micrograms. Net price 3 × 28-tab pack = £1.76

Norgeston® (Bayer) (POM)

Tablets, s/c, levonorgestrel 30 micrograms. Net price 35-tab pack = 98p

Noriday® (Pharmacia) (POM)

Tablets, norethisterone 350 micrograms. Net price 3 × 28-tab pack = £2.10

7.3.2.2 Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate (*Depo-Provera*®) is a long-acting progestogen given by intramuscular injection; it is as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Heavy bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after the birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of heavy or prolonged bleeding may be increased). The manufacturer advises that in women who are breast-feeding, the first dose should be delayed until 6 weeks after the birth — however, evidence suggests no harmful effect to infant if given earlier; the benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks

Reduction in bone mineral density and, rarely, osteoporosis and osteoporotic fractures have also been reported with medroxyprogesterone acetate. The reduction in bone mineral density occurs in the first 2–3 years of use and then stabilises. See also CSM advice below.

CSM advice

The CSM has advised that:

- in adolescents, medroxyprogesterone acetate (*Depo-Provera*®) be used only when other methods of contraception are inappropriate;
- in all women, benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against risks;
- in women with risk factors for osteoporosis a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (*Noristerat*®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An **etonogestrel-releasing implant** (*Implanon*®), consisting of a single flexible rod, is also available; the rod is inserted subdermally into the lower surface of the upper arm and it provides effective contraception for up to 3 years. The manufacturer advises that in heavier women, blood etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement should be considered in such patients—however evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of *Implanon*® is rapidly reversed on removal of the implant. *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

The cautions, contra-indications, and side-effects of oral progestogen-only contraceptives apply to parenteral progestogen-only contraceptives, except that parenteral preparations reliably inhibit ovulation and therefore protect against ectopic pregnancy and functional ovarian cysts.

Interactions Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. However, effectiveness of norethisterone and etonogestrel (but not medroxyprogesterone acetate) may be reduced by enzyme-inducing drugs; additional contraceptive precautions should be taken whilst taking the enzyme-inducing drug and for 4 weeks after stopping it or an alternative contraceptive method should be considered if long-term use of the enzyme-inducing drug is contemplated.

PARENTERAL PROGESTOGEN-ONLY CONTRACEPTIVES

Cautions see notes above and under preparations; possible risk of breast cancer, see oral progestogen-only contraceptives (section 7.3.2.1); history during pregnancy of pruritus or of deterioration of otosclerosis, disturbances of lipid metabolism; **interactions:** see notes above and Appendix 1 (progestogens)

Counselling Full counselling backed by *patient information leaflet* required before administration

Contra-indications see notes above; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

Side-effects see notes above; injection-site reactions

Cervical cancer Use of injectable progestogen-only contraceptives is associated with a small increased risk of cervical cancer; this increased risk may be similar to that seen with combined oral contraceptives, see p. 479. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

Licensed use consult product literature for the licensing status of individual preparations

Indication and dose

Contraception see also notes above and under preparations (roles vary according to preparation)
For dose see under preparations

Injectable preparations

Depo-Provera® (Pfizer) (POM)

Injection (aqueous suspension), medroxyprogesterone acetate 150 mg/mL, net price 1-mL prefilled syringe = £6.01, 1-mL vial = £6.01. Counselling, see patient information leaflet

Dose

- By deep intramuscular injection
150 Mg within first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if

breast-feeding); for long-term contraception, repeated every 12 weeks (if interval greater than 12 weeks and 5 days, rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection)

Noristerat® (Schering Health) (POM)

Injection (oily), norethisterone enantate 200 mg/mL, net price 1-mL amp = £3.59. Counselling, see patient information leaflet

Dose

• By deep intramuscular injection

Given very slowly *into gluteal muscle*, short-term contraception, 200 mg within first 5 days of cycle or immediately after parturition (duration 8 weeks); may be repeated once after 8 weeks (withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment)

Implants

Implanon® (Organon) (POM)

Implant, containing etonogestrel 68 mg in each flexible rod, net price = £81.00. Counselling, see patient information leaflet

Dose

• By subdermal implantation

No previous hormonal contraceptive, 1 implant inserted during first 5 days of cycle; parturition or abortion in second trimester, 1 implant inserted between days 21–28 after delivery or abortion (if inserted after 28 days additional precautions necessary for next 7 days); abortion in first trimester, 1 implant inserted immediately; changing from another method of contraception, consult product literature; remove within 3 years of insertion

7.3.2.3 Intra-uterine progesterone-only device

The progesterone-only intra-uterine system, *Mirena*[®], releases **levonorgestrel** directly into the uterine cavity. It is used as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. This may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progesterone-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progesterone-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progesterone-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time (section 6.4.1.2).

Cautions and contra-indications Generally the cautions and contra-indications for the progesterone-only intra-uterine system are as for standard intra-uterine devices (section 7.3.4), but the risk of ectopic pregnancy is considerably smaller. Although the progesterone-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. Since levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progesterone-only intra-uterine system and additional contraceptive precautions are not required.

Side-effects Initially, changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) are common; endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and mood changes, and in the bleeding pattern usually occurs a few months after insertion and bleeding may often become very light or absent. Functional ovarian cysts (usually asymptomatic) can occur and usually resolve spontaneously (ultrasound monitoring recommended).

INTRA-UTERINE PROGESTERONE-ONLY SYSTEM

Cautions see notes above; advanced uterine atrophy; not suitable for emergency contraception; **interactions:** see notes above and Appendix 1 (progestogens)

Hepatic impairment caution in active liver disease and liver tumour

Pregnancy remove system—teratogenicity cannot be excluded

Breast-feeding progesterone-only contraceptives do not affect lactation

Contra-indications see notes above

Side-effects see notes above; also abdominal pain; peripheral oedema; nervousness; salpingitis and pelvic inflammatory disease; pelvic pain, back pain; rarely hirsutism, hair loss, pruritus, migraine, rash

Licensed use not licensed for use in women under 18 years

Indication and dose

See under preparation

Mirena[®] (Bayer) (POM)

Intra-uterine system, T-shaped plastic frame (impregnated with barium sulphate and with threads attached to base) with polydimethylsiloxane reservoir releasing levonorgestrel 20 micrograms/24 hours. Net price = £83.16. Counselling, see patient information leaflet

Dose

Contraception and menorrhagia

Insert into uterine cavity within 7 days of onset of menstruation (anytime if replacement) or immediately after first-trimester termination by curettage; post-partum insertions should be delayed until 6 weeks after delivery; effective for 5 years

□ INTRA-UTERINE PROGESTOGEN-ONLY SYSTEM (continued)

Prevention of endometrial hyperplasia during oestrogen replacement therapy

Insert during last days of menstruation or withdrawal bleeding or anytime if amenorrhoeic; effective for 4 years

7.3.3 Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted diseases (including HIV); high frequency use of the spermicide nonoxinol '9' has been associated with genital lesions, which may increase the risk of acquiring these infections.

CSM advice

Products such as petroleum jelly (*Vaseline*®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted diseases (including HIV).

Gygel® (Marlborough)

Gel, nonoxinol '9' 2%, net price 30 g = £4.25

Excipients include hydroxybenzoates (parabens), propylene glycol, sorbic acid

Condoms: No evidence of harm to latex condoms and diaphragms

7.3.4 Contraceptive devices

Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages; however it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years (see below).

Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper. The intra-uterine device *Gyne-T 380*® (Janssen-Cilag) is no longer available, but some women may have the device in place until 2009. The intra-uterine devices *Multiload*® *Cu250* and *Multiload*® *Cu250 Short* (Organon) have been discontinued, but some women may have the devices in place until 2011.

A frameless, copper-bearing intra-uterine device (*GyneFix*®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed by the patient information leaflet.*

The timing and technique of fitting an intra-uterine device are critical for its subsequent performance and call for proper training and experience. Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation. The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted disease. Women under 25 years are at a higher risk of sexually transmitted diseases, and pre-insertion screening (for chlamydia, and depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appro-

appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend *as an emergency* if she experiences sustained pain during the next 20 days.

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible.

INTRA-UTERINE CONTRACEPTIVE DEVICES

Cautions see notes above; also anaemia, menorrhagia (progestogen intra-uterine system might be preferable, section 7.3.2.3), endometriosis, severe primary dysmenorrhoea, history of pelvic inflammatory disease, diabetes, fertility problems, nulliparity and young age, severely scarred uterus (including after endometrial resection) or severe cervical stenosis; valvular heart disease or history of endocarditis (Table 2, section 5.1); drug- or disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression); epilepsy (risk of seizure at time of insertion); increased risk of expulsion if inserted before uterine involution; gynaecological examination before insertion, 6–8 weeks after then annually but counsel women to see doctor promptly in case of significant symptoms, especially pain; anticoagulant therapy (avoid if possible)

Contra-indications severe anaemia, recent sexually transmitted infection (if not fully investigated and treated), unexplained uterine bleeding, distorted or small uterine cavity, genital malignancy, active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration), pelvic inflammatory disease, established or marked immunosuppression; *copper devices*: copper allergy, Wilson's disease, medical diathermy

Pregnancy remove device; if pregnancy occurs, increased likelihood that it may be ectopic

Side-effects uterine or cervical perforation, displacement, expulsion; pelvic infection may be exacerbated, menorrhagia, dysmenorrhoea, allergy; *on insertion*: pain (alleviated by NSAID such as ibuprofen 30 minutes before insertion) and bleeding, occasionally epileptic seizure and vasovagal attack

Indication and dose

See notes above

Flexi-T 300® (FP)

Intra-uterine device, copper wire, surface area approx. 300 mm² wound on vertical stem of T-shaped plastic carrier, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.47
For uterine length over 5 cm; replacement every 5 years (see also notes above)

Flexi-T® + 380 (FP)

Intra-uterine device, copper wire, surface area approx. 380 mm² wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, impregnated with barium sulphate for radio-opacity, monofilament thread

attached to base of vertical stem; preloaded in inserter, net price = £10.06
For uterine length over 6 cm; replacement every 5 years (see also notes above)

GyneFix® (FP)

Intra-uterine device, 6 copper sleeves with surface area of 330 mm² on polypropylene thread, net price = £26.64
Suitable for all uterine sizes; replacement every 5 years

Load® 375 (Durbin)

Intra-uterine device, copper wire, surface area approx. 375 mm², wound on vertical stem of U-shaped plastic carrier, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.00
For uterine length over 7 cm; replacement every 5 years (see also notes above)

Mini TT 380® Slimline (Durbin)

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £11.70
For minimum uterine length 5 cm; replacement every 5 years (see also notes above)

Multiload® Cu375 (Organon)

Intra-uterine device, as *Load® 375*, with copper surface area approx. 375 mm² and vertical stem length 3.5 cm, net price = £9.24
For uterine length 6–9 cm; replacement every 5 years (see notes above)

Nova-T® 380 (Schering Health)

Intra-uterine device, copper wire with silver core, surface area approx. 380 mm² wound on vertical stem of T-shaped plastic carrier, impregnated with barium sulphate for radio-opacity, threads attached to base of vertical stem, net price = £13.50
For uterine length 6.5–9 cm; replacement every 5 years (see notes above)

T-Safe® CU 380 A (FP)

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper collar on the distal portion of each arm, total surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, threads attached to base of vertical stem, net price = £10.29
For uterine length 6.5–9 cm; replacement every 10 years (see notes above)

TT 380® Slimline (Durbin)

Intra-uterine device, copper wire wound on vertical stem of T-shaped plastic carrier, with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £11.70
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

◊ INTRA-UTERINE CONTRACEPTIVE DEVICES (continued)

UT 380 Short® (Durbin)

Intra-uterine device, copper wire wound on vertical stem of T-shaped plastic carrier, total surface area approx. 380 mm², impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; net price = £10.53

For uterine length 5–7 cm; replacement every 5 years (see also notes above)

UT 380 Standard® (Durbin)

Intra-uterine device, copper wire, surface area approx. 380 mm², wound on vertical stem of T-shaped plastic carrier, impregnated with barium sulphate for radio-opacity, thread attached to base of vertical stem; net price = £10.53

For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Other contraceptive devices

▀ Rubber contraceptive caps

Type A Contraceptive Pessary

Opaque rubber, sizes 1 (50 mm), 2 (55 mm), 3 (60 mm), 4 (65 mm), 5 (75 mm), net price = £6.85

Type B Contraceptive Pessary

Opaque rubber, sizes 22 to 31 mm (rising in steps of 3 mm), net price = £8.46

Type C Contraceptive Pessary

Opaque rubber, sizes 1 to 3 (42, 48, and 54 mm), net price = £7.26

▀ Silicone contraceptive caps

Silicone Contraceptive Pessary

Silicone, sizes 22, 26, and 30 mm, net price = £15.00
Brands include *FemCap*®

▀ Rubber contraceptive diaphragms

Type A Diaphragm with Flat Metal Spring

Transparent rubber with flat metal spring, sizes 55–95 mm (rising in steps of 5 mm), net price = £5.78
Brands include *Reflexions*®

Type B Diaphragm with Coiled Metal Spring

Opaque rubber with coiled metal spring, sizes 60–100 mm (rising in steps of 5 mm), net price = £6.59

Type C Arcing Spring Diaphragm

Opaque rubber with arcing spring, sizes 60–95 mm (rising in steps of 5 mm), net price = £7.49

▀ Silicone contraceptive diaphragms

Type B Diaphragm with Coiled Metal Spring

Silicone with coiled metal spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35
Brands include *Milex Omniflex*®

Type C Arching Spring diaphragm

Silicone with arcing spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35
Brands include *Milex Arcing Style*®

7.3.5 Emergency contraception

Hormonal methods

Hormonal emergency contraception involves the use of **levonorgestrel**. It is effective if taken within 72 hours (3 days) of unprotected intercourse; taking the dose as soon as possible increases efficacy. Levonorgestrel may also be used between 72 and 120 hours after unprotected intercourse [unlicensed use] but efficacy decreases with time. Hormonal emergency contraception is less effective than insertion of an intra-uterine device (see below).

If vomiting occurs within 2 hours of taking levonorgestrel, a replacement dose should be given. If an anti-emetic is required domperidone is preferred.

When prescribing hormonal emergency contraception the doctor should explain:

- that the next period may be early or late;
- that a barrier method of contraception needs to be used until the next period;
- the need to return promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy (and also in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned).

Interactions The effectiveness of hormonal emergency contraception is reduced by enzyme-inducing drugs; a copper intra-uterine device can be offered instead or the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

LEVONORGESTREL

Cautions see notes above; past ectopic pregnancy; severe malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration); **interactions:** see notes above and Appendix 1 (progestogens)

Pregnancy avoid but no evidence of harm to fetus; see also notes above

Breast-feeding progestogen-only contraceptives do not affect lactation

Contra-indications acute porphyria (section 9.8.2)

◻ LEVONORGESTREL (*continued*)

Side-effects menstrual irregularities (see also notes above), nausea, low abdominal pain, fatigue, headache, dizziness, breast tenderness, vomiting

Licensed use consult product literature

Indication and dose

Emergency contraception

• By mouth

1.5 mg as a single dose as soon as possible after coitus (preferably within 12 hours but no later than after 72 hours)

¹Levonelle® One Step (Schering Health)

Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £13.83

1. Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society of Great Britain

Levonelle® 1500 (Schering Health) (POM)

Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £5.11

Intra-uterine device

Insertion of an intra-uterine device is more effective than the hormonal methods of emergency contraception. A copper intra-uterine contraceptive device (section 7.3.4) can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted diseases should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin 1 g as a single dose). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation).

7.4 Drugs for genito-urinary disorders

7.4.1 Drugs for urinary retention

7.4.2 Drugs for urinary frequency, enuresis, and incontinence

7.4.3 Drugs used in urological pain

7.4.4 Bladder instillations and urological surgery

7.4.5 Drugs for erectile dysfunction

For drugs used in the treatment of urinary-tract infections see section 5.1.13.

7.4.1 Drugs for urinary retention

Acute retention is painful and is treated by catheterisation.

Chronic retention is painless and often long-standing. Clean intermittent catheterisation may be considered. After the cause has been established and treated, drugs may be required to increase detrusor muscle tone.

Alpha-blockers such as doxazosin and tamsulosin can be used in some cases of dysfunctional voiding.

Alpha-blockers

The selective alpha-blockers **doxazosin** and **tamsulosin** can be used to improve bladder emptying in children with dysfunctional voiding where the post-void residual urine volume is significant; treatment should be under specialist advice only. Alpha-blockers can reduce blood pressure rapidly after the first dose and should be introduced with caution.

DOXAZOSIN

Cautions see under doxazosin (section 2.5.4)

Contra-indications see under doxazosin (section 2.5.4)

Side-effects see under doxazosin (section 2.5.4)

Licensed use not licensed for use in children

Indication and dose

Dysfunctional voiding (see notes above)

• By mouth

Child 4–12 years initially 0.5 mg daily increased at monthly intervals according to response; maximum 2 mg daily

Child 12–18 years initially 1 mg daily, dose may be doubled at intervals of 1 month according to response; usual maintenance 2–4 mg daily; max. 8 mg daily

Hypertension section 2.5.4

◼ Preparations

Section 2.5.4

TAMSULOSIN HYDROCHLORIDE

Cautions care with initial dose (postural hypotension); cataract surgery (risk of intra-operative floppy iris syndrome); **interactions:** Appendix 1 (alpha-blockers)

Renal impairment use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²

Contra-indications history of postural hypotension

Hepatic impairment avoid in severe impairment

Side-effects dizziness, headache, asthenia; abnormal ejaculation; *less commonly* nausea, vomiting, constipation, diarrhoea, palpitation, postural hypotension, syncope, rhinitis, rash, pruritus, and urticaria; *very rarely* angioedema and priapism; also drowsiness, blurred vision, dry mouth, and oedema

Licensed use not licensed for use in children

Indication and dose

Dysfunctional voiding (see notes above)

• By mouth

Child 12–18 years 400 micrograms once daily

Tamsulosin hydrochloride (Non-proprietary) (POM)

Capsules, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-cap pack = £6.11. Label: 25

Brands include *Bazetham*® MR, *Contiflo*® XL, *Diffundox*® XL, *Omnic*® MR, *Stronazon*® MR, *Tabphyn*® MR

Flomaxtra® XL (Astellas) (POM)

Tablets, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-tab pack = £17.55. Label: 25

7.4.2 Drugs for urinary frequency, enuresis, and incontinence**Urinary incontinence**

Involuntary detrusor contractions cause urgency and urge incontinence, usually with frequency and nocturia. Antimuscarinic drugs reduce these contractions and increase bladder capacity; **oxybutynin** also has a direct relaxant effect on urinary smooth muscle. Oxybutynin can be considered first for children under 12 years. Side-effects limit the use of oxybutynin but they may be reduced by starting at a lower dose and then slowly titrating upwards; alternatively oxybutynin can be given by intravesicular instillation. **Tolterodine** is also effective for urinary incontinence; it can be considered for children over 12 years, or for younger children who have failed to respond to oxybutynin. Modified-release preparations of oxybutynin and tolterodine are available; they may have fewer side-effects. Antimuscarinic treatment should be reviewed soon after it is commenced, and then at regular intervals; a response generally occurs within 6 months but occasionally may take longer. Children with nocturnal enuresis may require specific additional measures if night-time symptoms also need to be controlled (see p. 493).

Cautions Antimuscarinic drugs should be used with caution in autonomic neuropathy and in hepatic or renal impairment. Antimuscarinics can worsen hyperthyroidism, congestive heart failure, arrhythmias, and tachycardia. For **interactions** see Appendix 1 (antimuscarinics).

Contra-indications Antimuscarinic drugs should be avoided in myasthenia gravis, significant bladder outflow obstruction or urinary retention, severe ulcerative colitis, toxic megacolon, and in gastro-intestinal obstruction or intestinal atony.

Side-effects Side-effects of antimuscarinic drugs include dry mouth, gastrointestinal disturbances including constipation, blurred vision, dry eyes, drowsiness, difficulty in micturition (less commonly urinary retention), palpitation, and skin reactions (including dry skin, rash, and photosensitivity); also headache, diarrhoea, angioedema, arrhythmias, and tachycardia. Central nervous system stimulation, such as restlessness, disorientation, hallucination, and convulsions may occur. Antimuscarinic drugs may reduce sweating leading to heat sensations and fainting in hot environments or in patients with fever.

OXYBUTYNNIN HYDROCHLORIDE

Cautions see also notes above; also acute porphyria (section 9.8.2); **interactions:** Appendix 1 (antimuscarinics)

Hepatic impairment manufacturer advises caution

Renal impairment manufacturer advises caution

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding present in milk—manufacturer advises avoid

Contra-indications see notes above

◊ OXYBUTYNYN HYDROCHLORIDE (*continued*)

Side-effects see notes above; also dizziness; *less commonly* anorexia, facial flushing; *rarely* night terrors

Licensed use not licensed for use in children under 5 years; intravesical instillation not licensed

Indication and dose

Urinary frequency, urgency and incontinence, neurogenic bladder instability

• By mouth

Child 2–5 years 1.25–2.5 mg 2–3 times daily;

Child 5–12 years 2.5–3 mg twice daily, increased to 5 mg 2–3 times daily

Child 12–18 years 5 mg 2–3 times daily, increased if necessary to max. 5 mg 4 times daily

• By intravesical instillation

Child 2–18 years 5 mg 2–3 times daily

Nocturnal enuresis associated with overactive bladder

• By mouth

Child 7–18 years 2.5–3 mg twice daily increased to 5 mg 2–3 times daily (last dose before bedtime)

Oxybutynin Hydrochloride (Non-proprietary) (POM)

Tablets, oxybutynin hydrochloride 2.5 mg, net price 56-tab pack = £7.24; 3 mg, 56-tab pack = £9.15;

5 mg, 56-tab pack = £10.21, 84-tab pack = £2.96. Label: 3

Intravesical instillation, oxybutynin (as hydrochloride) 5 mg/30 mL.

Available from 'special-order' manufacturers or specialist importing companies, see p. 943

Cystrin® (Sanofi-Synthelabo) (POM)

Tablets, oxybutynin hydrochloride 3 mg, net price 56-tab pack = £9.15; 5 mg (scored), 84-tab pack = £22.88. Label: 3

Ditropan® (Sanofi-Synthelabo) (POM)

Tablets, both blue, scored, oxybutynin hydrochloride 2.5 mg, net price 84-tab pack = £6.86; 5 mg, 84-tab pack = £13.34. Label: 3

Elixir, oxybutynin hydrochloride 2.5 mg/5 mL. Net price 150-mL pack = £5.74. Label: 3

◄ Modified release

Lyrinel® XL (Janssen-Cilag) (POM)

Tablets, m/r, oxybutynin hydrochloride 5 mg (yellow), net price 30-tab pack = £11.48; 10 mg (pink), 30-tab pack = £22.95. Label: 3, 25

Dose

Neurogenic bladder instability

• By mouth

Child 6–18 years initially 5 mg once daily adjusted according to response in steps of 5 mg at weekly intervals; max. 15 mg once daily

Note Children taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel*® XL

TOLTERODINE TARTRATE

Cautions see notes above; also history of QT-interval prolongation; concomitant use with other drugs known to prolong QT interval; **interactions**: see Appendix 1 (antimuscarinics)

Contra-indications see notes above

Hepatic impairment reduce dose; avoid *Detrusitol*® XL in hepatic impairment

Renal impairment reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²; avoid *Detrusitol*® XL if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²

Pregnancy manufacturer advises avoid—toxicity in *animal* studies

Breast-feeding manufacturer advises avoid—no information available

Side-effects see notes above; also chest pain, peripheral oedema; sinusitis, bronchitis; paraesthesia, fatigue, vertigo, weight gain; flushing also reported

Licensed use not licensed for use in children under 18 years

Indication and dose

Urinary frequency, urgency, incontinence

• By mouth

Child 2–18 years 1 mg once daily, increase according to response; max. 2 mg twice daily

Detrusitol® (Pharmacia) (POM)

Tablets, f/c, tolterodine tartrate 1 mg, net price 56-tab pack = £29.03; 2 mg, 56-tab pack = £30.56

◄ Modified release

Detrusitol® XL (Pharmacia) (POM)

Capsules, blue, m/r, tolterodine tartrate 4 mg, net price 28-cap pack = £29.03. Label: 25

Note Children stabilised on immediate-release tolterodine 2 mg twice daily may be transferred to *Detrusitol*® XL 4 mg once daily

Nocturnal enuresis

Nocturnal enuresis is common in young children but persists in as many as 5% by 10 years of age. Treatment is not appropriate in children under 5 years and it is usually not needed in those aged under 7 years and in cases where the child and parents are not anxious about the bedwetting; however, children over 10 years usually require prompt treatment. An **enuresis alarm** should be first-line treatment for well-motivated, well supported children aged over 7 years because alarms have a lower relapse rate than drug treatment when discontinued. Use of

an alarm can be combined with drug therapy if either method alone is unsuccessful.

Drug therapy is not usually appropriate for children under 7 years of age; it can be used when alternative measures have failed, preferably on a short-term basis, for example to cover periods away from home, or if the child and family are anxious about the condition. The possible side-effects of the various drugs should be borne in mind when they are prescribed.

Desmopressin (section 6.5.2), an analogue of vasopressin, is used for nocturnal enuresis; it is given by oral or by sublingual administration. Particular care is needed to avoid fluid overload and treatment should not be continued for longer than 3 months without interrupting treatment for one week for full reassessment. When stopping treatment with desmopressin gradual withdrawal may be considered. Desmopressin should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects.

Tricyclics (section 4.3.1) such as **amitriptyline**, **imipramine**, and less often **nortriptyline** can be used, but behavioural disturbances can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a full physical examination is made and the child is fully reassessed; toxicity following overdose with tricyclics is of particular concern.

Nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed by antimuscarinic drugs (see Urinary incontinence, p. 492), with the addition of desmopressin if necessary.

7.4.3 Drugs used in urological pain

Lidocaine (lignocaine) gel is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation (section 15.2).

Alkalinisation of urine

Alkalinisation of urine can be undertaken with **potassium citrate**. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections.

POTASSIUM CITRATE

Cautions cardiac disease; **interactions:** Appendix 1 (potassium salts)

Renal impairment close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

Side-effects hyperkalaemia on prolonged high dosage, mild diuresis

Indication and dose

Relief of discomfort in mild urinary-tract infections, alkalinisation of urine for dose see preparations below

Potassium Citrate Mixture BP (Potassium Citrate Oral Solution)

Oral solution, potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon

flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL. Label: 27

Dose

• By mouth

Child 1–6 years 5 mL 3 times daily well diluted with water

Child 6–18 years 10 mL 3 times daily well diluted with water

Note Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections

7.4.4 Bladder instillations and urological surgery

Bladder infection Various solutions are available as irrigations or washouts.

Aqueous **chlorhexidine** (section 13.11.2) can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas* spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used, but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile **sodium chloride solution 0.9%** (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Dissolution of blood clots Clot retention is usually treated by irrigation with sterile **sodium chloride solution 0.9%** but sterile **sodium citrate solution for bladder irrigation 3%** may also be helpful.

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

CATHETER PATENCY SOLUTIONS

Chlorhexidine 0.02%

Brands include *Uriflex C*[®], 100-mL sachet = £2.40; *Uro-Tainer Chlorhexidine*[®], 100-mL sachet = £2.60

Sodium chloride 0.9%

Brands include *OptiFlo S*[®], 50- and 100-mL sachets = £3.20; *Uriflex S*[®], 100-mL sachet = £2.40; *Uriflex SP*[®], with integral drug additive port, 100-mL sachet = £2.40; *Uro-Tainer Sodium Chloride*[®], 50- and 100-mL sachets = £3.23; *Uro-Tainer M*[®], with integral drug additive port, 50- and 100-mL sachets = £2.90

Solution G

Citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%. Brands include *OptiFlo G*[®], 50- and 100-mL sachets = £3.40; *Uriflex G*[®], 100-mL sachet = £2.40; *Uro-Tainer Twin Suby G*, 2 × 30-mL = £4.42

Solution R

Citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%. Brands include *OptiFlo R*[®], 50- and 100-mL sachets = £3.40; *Uriflex R*[®], 100-mL sachet = £2.40; *Uro-Tainer Twin Solutio R*, 2 × 30-mL = £4.42

7.4.5 Drugs for erectile dysfunction

This section is not included in *BNF for Children*. Adolescents presenting with erectile dysfunction should be referred to a specialist.

8 Malignant disease and immunosuppression

8.1	Cytotoxic drugs	496
8.1.1	Alkylating drugs	502
8.1.2	Cytotoxic antibiotics.....	505
8.1.3	Antimetabolites	507
8.1.4	Vinca alkaloids and etoposide	511
8.1.5	Other antineoplastic drugs	513
8.2	Drugs affecting the immune response	517
8.2.1	Antiproliferative immunosuppressants	518
8.2.2	Corticosteroids and other immunosuppressants	520

8.2.4	Other immunomodulating drugs.....	526
8.3	Sex hormones and hormone antagonists in malignant disease	527

8.1 Cytotoxic drugs

8.1.1	Alkylating drugs
8.1.2	Cytotoxic antibiotics
8.1.3	Antimetabolites
8.1.4	Vinca alkaloids and etoposide
8.1.5	Other antineoplastic drugs

The management of childhood cancer is complex and is generally confined to specialist regional centres, and some associated shared-care units, affiliated to the Children's Cancer and Leukaemia Group (CCLG). The Group, together with other national and international organisations, develops and co-ordinates treatment protocols. In children, cytotoxic drugs are almost always administered in the context of a formal protocol.

Cytotoxic drugs have both anti-cancer activity and the potential for damage to normal tissue. In children, chemotherapy is almost always started with curative intent, but may be continued as palliation if the disease is refractory.

Chemotherapy with a combination of two or more cytotoxic drugs aims to reduce the development of resistance and to improve cytotoxic effect. Treatment protocols generally incorporate a series of treatment courses at defined intervals with clear criteria for starting each course, such as adequate bone-marrow recovery and renal or cardiac function. The principal component of treatment for leukaemias in children is cytotoxic therapy, whereas solid tumours may be managed with surgery or radiotherapy in addition to chemotherapy.

Guidelines on handling cytotoxic drugs:

1. Trained personnel should reconstitute cytotoxics;
2. Reconstitution should be carried out in designated areas;
3. Protective clothing (including gloves, gowns, and masks) should be worn;
4. The eyes should be protected and means of first aid should be specified;
5. Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard);
6. Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material;
7. Staff exposure to cytotoxic drugs should be monitored.

Only medical or nursing staff who have received appropriate training should administer parenteral cytotoxics. In most instances central venous access will be required for the intravenous administration of cytotoxics to children; care is required to avoid the risk of extravasation (see Side-effects of Cytotoxic Drugs and their Management).

Intrathecal chemotherapy

A Health Service Circular (HSC 2003/010) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance must be available.

Copies, and further information may be obtained from:

Department of Health

PO Box 777

London SE1 6XH

Fax: 01623 724524

www.dh.gov.uk

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from many of the drug entries in this chapter.

Side-effects of cytotoxic drugs and their management

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers' product literature should be consulted for full details of side-effects of individual drugs.

Extravasation of intravenous drugs A number of cytotoxic drugs will cause severe local tissue irritation and necrosis if leakage into the extravascular compartment occurs. For information on the prevention and management of extravasation injury, see section 10.3.

Gastro-intestinal effects Management of gastro-intestinal effects of cytotoxic drugs includes the use of antacids, H₂-receptor antagonists, and proton pump inhibitors to protect the gastric mucosa, laxatives to treat constipation, and enteral and parenteral nutritional support.

Oral mucositis Good oral hygiene keeps the mouth clean and moist and helps to prevent mucositis; prevention is more effective than treatment of the complication. Good oral hygiene measures for children over 6 months include brushing teeth with a soft small brush with fluoride toothpaste 2–3 times daily, and rinsing the mouth frequently. Daily fluoride supplements (section 9.5.3) can be used on the advice of the child's dental team. For children under 6 months or when it is not possible to brush teeth, carers should be instructed how to clean the mouth using an oral sponge moistened with water or with an antimicrobial solution such as diluted chlorhexidine. Mucositis related to chemotherapy can be extremely painful and may, in some circumstances, require opioid analgesia (section 4.7.2). Secondary infection with candida is frequent; treatment with a systemically absorbed antifungal, such as fluconazole (section 5.2), is effective.

Nausea and vomiting Nausea and vomiting cause considerable distress to many children who receive chemotherapy, and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Susceptibility to nausea and vomiting may increase with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered, and to the individual's susceptibility to emetogenic stimuli.

Mildly emetogenic treatment—fluorouracil, etoposide, low doses of methotrexate, the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—carboplatin, doxorubicin, intermediate and low doses of cyclophosphamide, mitoxantrone (mitozantrone), and high doses of methotrexate.

Highly emetogenic treatment—cisplatin, dacarbazine, and high doses of alkylating drugs.

Anti-emetic drugs, when given regularly, help prevent or ameliorate emesis associated with chemotherapy in children.

Prevention of acute symptoms For patients at *low risk of emesis*, pretreatment with metoclopramide (or less commonly domperidone) continued for up to 24 hours after chemotherapy, is often effective (section 4.6); a 5HT₃ antagonist (section 4.6) may also be of benefit.

For patients at *high risk of emesis* or when other treatment is inadequate, a 5HT₃ antagonist (section 4.6) is often highly effective. The addition of dexamethasone and other anti-emetics may also be required.

Prevention of delayed symptoms Dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide. The 5HT₃ antagonists may have a role in preventing uncontrolled symptoms.

Prevention of anticipatory symptoms Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesiac, sedative, and anxiolytic effects.

Bone-marrow suppression All cytotoxic drugs except vincristine and bleomycin cause bone-marrow depression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as melphalan. Peripheral blood counts must be checked before each treatment. The duration and severity of neutropenia can be reduced by the use of granulocyte-colony stimulating factors (section 9.1.6); their use should be reserved for children who have previously experienced severe neutropenia.

Infection in a child with neutropenia requires immediate broad-spectrum antibacterial treatment that covers all likely pathogens (Table 1, section 5.1). Antifungal treatment (section 5.2) may be required in a child with prolonged neutropenia or fever lasting longer than 4–5 days. Chickenpox and measles can be particularly hazardous in immunocompromised children. Varicella-zoster immunoglobulin (section 14.5) is indicated if the child does not have immunity against varicella and has had close contact with infectious chickenpox or herpes zoster. Antiviral prophylaxis (section 5.3.2.1) can be considered in addition to varicella-zoster immunoglobulin or as an alternative if varicella-zoster immunoglobulin is inappropriate. If an immunocompromised child has come into close contact with an infectious individual with measles, normal immunoglobulin (section 14.5) should be given.

Alopecia Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients.

Pregnancy and reproductive function Before using cytotoxic drugs during pregnancy consideration should be given to both the prognosis of the patient and the fetal risk. The rapidly dividing cells of the fetus are potentially susceptible to the effects of cytotoxic drugs. Although antimetabolites are thought to be the strongest teratogens, specific risk assessment of individual cytotoxics is not possible with the available data. All of the long-term effects of cytotoxic exposure are not fully known.

The use of cytotoxic drugs during the first trimester is associated with the greatest risk of harm to the fetus; spontaneous abortion and teratogenicity are possible. If at all possible cytotoxic drugs should be avoided before week 10 of pregnancy.

In the second and third trimesters the risk of teratogenicity is negligible, but growth and developmental effects are possible. In the third trimester early

induction of delivery may be considered. If cytotoxic drugs are unavoidable in older girls with reproductive potential, contraceptive advice should be offered where appropriate. Regimens containing an alkylating drug carry the risk of causing permanent male sterility (but may not affect sexual potency).

Long-term and delayed toxicity Cytotoxic drugs may produce specific organ-related toxicity in children (e.g. cardiotoxicity with doxorubicin or nephrotoxicity with cisplatin and ifosfamide). Manifestations of such toxicity may not appear for several months or even years after cancer treatment. Careful follow-up of survivors of childhood cancer is therefore vital; national and local guidelines have been developed to facilitate this.

Thromboembolism Venous thromboembolism can be a complication of cancer itself, but chemotherapy can also increase the risk.

Tumour lysis syndrome Tumour lysis syndrome occurs secondary to spontaneous or treatment related rapid destruction of malignant cells. Features include hyperkalaemia, hyperuricaemia, and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early recognition of patients at risk and initiation of prophylaxis or therapy for tumour lysis syndrome is essential.

Drugs for cytotoxic-induced side-effects

Anthracycline-induced cardiotoxicity

The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.
